tion of the draft), it went, as in other countries with cabinet government, to the cabinet. In Germany it passed always through one more preliminary stage at least—it went to the *Reichsrat* (the State Council), and there was subjected to a very close scrutiny from the standpoint of the various state governments which gave their delegates general instructions.<sup>49</sup> Then, if the bill was of outstanding social or economic importance, it had to pass through the *Reichswirtschaftsrat* (the Economic Council),<sup>50</sup> and sometimes, to save time, the bill appeared before these two assemblies simultaneously. Only then, with the amendments accepted by the government or put down as objections or advice, was the first reading reached. Between the first and the second readings an interval of at least two days had to elapse. The intention is obvious; it was to avoid surprise and inconsiderateness. But the rule was surely one for times of emergency only (when the minority was in danger) and when, in fact, it could be set aside;<sup>51</sup> for between the first and the second reading there was the committee stage which lasted many days.

The next stage was the most important one—it was the committee stage. It was possible for the *Reichstag* not to send the bill to a committee.<sup>52</sup> But the practice in every case was to make the committee the court of judgment within the very wide limits of whether or not the bill should be passed at all. We shall return to the meaning of the committee stage soon. The second reading followed two days after the report of the committee, an important advisory document, had been distributed. This reading was, as a rule, confined to the articles, and is not spread, without special permission, into general discussion except for the speech of the reporter of the commission. Amendments

<sup>48</sup> G. O. (*Geschäftsordnung*) 37.

were freely put. An interval of two days was the minimum between the second and the third readings.

The third reading was a rather formal editorial stage, with little debate, though by the rules the general principles would be discussed, and amendments could be offered when supported by fifteen members.

*The United States.* The House of Representatives has the system of three readings, but debate is so closed, so cut and dried by the parties and the speaker, that it is hardly worth while speaking of these stages. The committee is here more than anywhere else, everything: the House, nothing. The first reading is merely one of notifying the House in the *Journal* and the *Record* that a bill has been introduced bearing such and such a title. Then the bill goes to committee, which always amends and often kills the bill. If it ever emerges, its second reading is the occasion for a discussion of the articles and amendments thereto. The actual reading of the text may be and not infrequently is demanded, to the waste of considerable time. The third reading is almost purely an automatic and undebated acceptance of what has resulted from the previous stages. The broad forms are those of the English Parliament in Jefferson's time, but American experience has charged them with such a different meaning and balance that the two systems have ceased to bear any resemblance.

*The Value of Several Readings.* Why are these stages still existent, when parties and the committee system are so vital to the procedure, and so strong in their influence over the evolution of a bill and its discussion at each turn?

Apparently, because when stages are named they give the impression of orderly progress. Each one implies notice and advertisement to all who are concerned: and this adds to the authority of the law. As long as successive and separate forms are prescribed, any one of them may, in the case of need, be used with all emphasis upon their obstructionist possibilities. They are possible safeguards against potential coercion of the opposition by the

government, and of the rank and file by their leaders. They also look back to the days when parliaments needed every means of obstructing the Crown and its friends. Today, in the United States, they are used to obstruct the friends of an uncongenial President. Few are the decisions which are born of the discussions. The Parthian shot allowed in France, and the general discussion allowed in all countries on the final reading, are indicative of the modern meaning and practice of parliamentary debate. It is a conscious address to the world outside the House. It is speech for *Hansard* and the *Congressional Record*, for *Le Monde*, *Der Tageblatt*, *The Times*, and *The Herald-Tribune*. Here is the chance to inform the country, agitate minds and consciences, and have a mutual exhibition of the excellences and deficiencies of government and opposition parties. In England the government, in France the government and the commissions, in Weimar Germany the government and the commissions, in the United States the party leaders and the committees, decide and debate: the rest is advertisement, explanation, electoral strategy, the joy of talking, and sealing wax.

*Absenteeism and the Private Member.* It is a well-known fact that during legislative debate the chamber is attended by a mere handful of members, unless upon the general discussion. When technical points, perhaps of very great importance, are under discussion, members are in the libraries, the buffet, the smoking room, or are present with ineffable boredom and imminent sleep on their faces, wondering why on earth he or she *will* go on talking. It is notorious, also, that members vote without having heard the discussion. In France, which is an exception in this matter, voting by proxy is allowed; members may not hear even a single word said for or against the bill in all its stages. Their party friends have the little blue or white counters with which to say "Yes" or "No" to a bill or a policy or a treaty.

The truth is that parliamentary power is, in the matter of legislation, only exercisable through the party or in close con-

## PARLIAMENTARY LEGISLATIVE COMMITTEES

cert with a small number of colleagues who are entrusted with the duty of advising the house. The unattached member has slight place in this scheme. A one-six-hundredth or four-hundred-and-thirtieth part of the time cannot be meted out to him. He cannot stand against the power of united officialdom, government opposition, leaders, and committees.

We shall gain an important insight into the vital mechanism of legislative bodies if we now turn our attention to the constitution and functions of the committees of which we have been speaking.

### PARLIAMENTARY LEGISLATIVE COMMITTEES

THIS difference between England and other countries must be remembered: in England the opportunity of substantial amendment is granted or denied by the government in full house rather than in the committees. The committees are only secondary amending bodies: the House itself decides main principles and major corollaries. In committees elsewhere the bill is totally malleable.

*England.* The modern history of the committees of the House of Commons began in 1885. As a result of the increasing pressure of business on the House, and the obstructionist tactics of the Irish members using the opportunities of ancient procedure, a way had to be found to relieve the congestion. In 1888, two standing committees were put into operation to take the committee stage. In 1907 their number was increased to four, one to deal with Scottish business only. The normal practice became to send all bills after second reading (except finance bills) to committees, unless the House otherwise ordered.

In 1919 the House found itself in arrears with its work: legislation had been stimulated by the war between democratic principle and economic acquisitiveness. Among the changes the committees were increased to six—five general and one Scottish.<sup>53</sup> The members on the commit-

tee were reduced from between sixty and eighty to between forty and sixty. Further, it had previously been the practice to constitute these committees on the basis of party strength in the House so that the committees became its microcosm. For any specific bill requiring special competence in committee, a committee could take on as many added members as had comprised its original membership. The representative number of the committees was reduced in the change of 1919 and the number of special members limited to between ten and fifteen. The committees were no longer limited to sessions before 2:15 P.M., as up till before 1907, or 4 P.M., as between 1907 and 1919. They could meet at any time they decided, except that their discussions were to be suspended during divisions in the House (illuminating rule!). The committees were reduced to five in 1926 and their minimum number reduced to thirty, and their maximum to fifty, while their optional auxiliary element was increased to between ten and thirty-five. It has for long been the practice for the committee on selection to change the membership of the entire committee as a bill is discharged. In 1946, the number was increased to six in all, with twenty as the permanent nucleus and up to thirty additional members.<sup>54</sup> To 1939 it was the practice for committees to sit in for four days a week between 11 A.M. and 1 P.M. The change of 1946 allowed them to meet three days a week for two and one-half hours each morning but also in the afternoons, if the House is not considering important business at a time when its committees are heavily laden.<sup>55</sup>

How do the standing committees operate, and what is the opinion of the House upon their value?

Standing committees are nominated by the Committee on Selection, which is itself

---

Report of the Select Committee on House of Commons (Procedure), 1915, p. 378.

<sup>54</sup> Which meant in practice, very often, those who were specially interested, from local or group considerations.

<sup>55</sup> Cf. First Report, Select Committee on Procedure, House of Commons, No. 9, October 16, 1945; and May, *op. cit.*, p. 614 ff.

<sup>53</sup> *Hansard*, February 18, 1919, cols. 815 ff. These changes followed in the wake of the

established sessionally. The Committee on Selection consists of eleven members, who by the practice of the House are experienced members nominated by the leaders and whips of the parties in accordance with the numerical strength of the parties. In the composition of the committees, the Committee of Selection is directed by the Standing Orders to have regard to the "composition of the House, the classes of bills committed to such committees," and to "the qualifications of the members selected." This means that as regards the ordinary standing committees the dominating considerations are party strength and loyalty, the geographical distribution of membership (rural-urban, North-South, etc.), and expertness, especially in the matter of auxiliary members. In the case of the Scottish committees all Scottish members sit, together with between ten and fifteen members nominated by the Committee of Selection, with an eye to the balance of parties in the House. When a bill relates to Wales only, all Welsh members are put on the appropriate committee. Further, the Committee on Selection nominates a panel of between eight and twelve chairmen of committees, and these appoint the chairmen of the standing committees from among themselves. The chairmen are naturally supporters of the government of the day.

Upon important bills extended amendments were not customary, but in fact, as soon as the committees went beyond verbal and minute emendation, they became the scene of party battles like those in the House, and the same problems of decorum, order, and obstruction confronted them.<sup>56</sup> In 1905, when the need of the committees had become so urgent, and experience was already sufficient to permit a judgment, the chairmen met and reported many complaints. Bills were being referred to committees for which

they were not adapted; they aroused fierce controversies or excited acute religious susceptibilities, or the House referred them with a very divided voice. The operations of the committees became stormy, and the minority felt bound to obstruct. If bills of this kind were to be referred, then the committees must get powers of closure equivalent to those of the speaker. This indicates quite clearly how congested was the House, which, in fact, found itself obliged more and more to seek the aid of the committees. It began to be pointed out that the representative character of the House was decreasing; for it was argued, if six hundred members are already but a minute and distorted mirror of a great country, is it not certain that a committee of sixty still less represents it? (Compare this with the smaller size of Congressional and European committees.) This feeling caused both members of committees and the House in general to be jealous of legislation—with the natural consequences:

(1) The minority on the committees began to obstruct by calculated absenteeism, often standing outside the committee-room until the majority made a quorum, or attempted to maneuver into a position of majority for the time being. This has caused serious annoyance to chairmen and the majority, and results in a heavier party pressure upon members to assure a government majority. The time of members is claimed to an excessive degree.

(2) The report stage in the House began to lengthen out, the members not on the committee wishing to re-exert their control.<sup>57</sup> However, the rules of the House have checked this practice. The report stage consists of the House of Commons' going over the bill in ordinary procedure of discussion. New amendments may be moved, and attempts may be made to restore the original text of the bill by canceling out the amendments in committee. But the House has saved itself from undue prolixity by giving the speaker the power to select amendments

<sup>56</sup> Balfour, *Debates*, July 5, 1905, col. 1156: "Party spirit has penetrated even to the Grand Committees. . . ." Cf. *Minutes of Evidence, Select Committee on Procedure*, 1915, p. 13; "The Government have got their supporters to support their Bills in Committee as a matter of confidence in them, and therefore there has been less latitude."

<sup>57</sup> Balfour, *Select Committee on Procedure of 1906*, pp. 14, 15; Ilbert, *op. cit.*, p. 37; Wortley, *op. cit.*, p. 47 ff.

to check the excessive repetition of debates in committee, and this power is exercised quite freely and usefully. There is unyielding resistance to various proposals either for taking the report stage away from the House or seriously modifying it, as the House wishes to remain master of the bill when it has returned from committee. Moreover, the House has much tenderness for the rights of minorities, and it holds to the report stage in order that minorities who may not get really effective representation on a standing committee, by reason of the smallness of the committees, may be able to state their mind in the House itself.

Nevertheless, the consensus is overwhelmingly in favor of the committees. For, in the *first* place, at least one generation has already arisen which knew not the more leisurely and easy ways of the past, and many of the new generation have graduated in the school of local government, which, in England, is committee government. *Second*, it is realized that the committees save the time of the House to such an extent that without them Parliament could never satisfy the legislative needs of the modern electorate.<sup>68</sup> Yet it is computed that in every fifty-six days spent on government bills (allowing for finance and constitutional bills) at least sixteen are spent in Committee of the Whole House and on report stage. *Third*, it is universally admitted that committees do beneficial work, considerable emphasis being placed upon the fact that they vote after hearing the arguments (this is less usual in the House) and that the government is prepared to make concessions as the argument goes and not use the power of the whips so much. (But no serious concessions of principle are made.)

These are great gains; but certain losses are suffered also. Complaints have been raised that there is insufficient publicity of committee proceedings. In fact, there

are some official reports (of recent years only) but only for the bills which cause the acutest political differences. The press reports are very summary. The result is that the country tends to lose what Parliament alone can offer if it is to be true to its name, and what it is important that representative government should provide: publicity of authoritative debate. Besides, attentive members of the House may get to know wherein the bill as reported differs from the bill as read a second time, but they are not informed of the reasons. These things, however, can easily be remedied. The House of Commons' reported bills could approximate in form to those of the French and Weimar German Parliaments: they could contain the original bill, the amendments to it, and short memoranda explaining the motives for the acceptance or rejection of amendments. This defect is aggravated by the numbers of the committees, and the extent of their labors. This enforced ignorance could be easily counteracted if the House added to its usual printed material a weekly or fortnightly periodical giving a conspectus of the work and proceedings of committees. This will probably be of no avail for the lazy member: but in all aspects of life we create devices accordant with the spirit of our purpose, in the hope that at least some of its servants will have the means of fulfilling the necessary tasks. Is it vain to trust that members will rise to the moral level of the institution?

Instead of the committees maintaining a permanent membership, which might constitute an expert and perhaps impartial jury, members who have exhausted their interest in a bill get discharged. Hence, there is a constant renewal of members, with those coming on who are prone to take an expert or interested attitude. Is the Continental and American system, which gives to committees a permanent interest in specific branches of government, the only way to make the committees work effectively (that is, expertly), and of making the member capable of intelligent criticism? Even in local government where the field of work

<sup>68</sup> In the sessions from 1919 to 1939, standing committees sat on an average of 95 days per session; in 1930-31, the highest was 152 days; in 1945, the Education Bill took 14 days for committee alone on the floor of the house!

is different, experience has shown the answer to be in the affirmative.

Altogether, we may frame this judgment of the committees of the House of Commons: Designed to relieve the House of work for which it had no time, they have done this, and the House is ceasing to fret over this loss of its power yet the House believes too little in the committee system for a more substantial economy of its time. The incidental advantage of committee work has been technically better legislation coupled with a moderation of the crudeness of party political judgments, especially as expressed before the electorate.

In 1946 the clerk of the House of Commons proposed a radical reform of committee and report stage. He proposed to delegate the report stage from the House itself—by giving the committee stage of bills not to the standing committees as usual hitherto, but to subcommittees of these standing committees, then allowing the standing committees to undertake the equivalent of the report stage usually undertaken by the House itself. His subcommittees would be different in size and membership according to the particular bill with which each was to be charged from time to time. He would have provided only two standing committees, with 75 or 100 members each, with three subcommittees of each. The two standing committees would be, in his scheme, "efficient substitutes for the House itself for the work of reviewing the results of the amendments in committee."<sup>59</sup>

The Select Committee on Procedure rejected these proposals, though they recognized that they would save the time of the House. Their reasons are significant:<sup>60</sup>

The removal of the report stage of bills from the floor of the House would be, in the words of Mr. Speaker, "a drastic interference with the rights of private Members", and would also adversely affect any smaller parties who could not receive adequate representation on the committees and sub-committees . . .

It should be emphasized that revenue and appropriation bills never go before standing committees; they are dealt with by committees of the whole House, that is, by the House as a whole resolving itself into committee, which means that the procedure is less formal and that members may speak more than once. Nor do standing committees deal with Provisional Order Bills; that is, bills which include a number of acts of minor legislation drafted by the departments and subject to blanket submission to the House for approval. It has been the steady practice to keep much important legislation on the floor of the House, as a committee of the whole. Here the government and the House have weighed the time to be saved and the burden of business downstairs and upstairs, against the political significance of the bill, and have given the latter major value.

Thus, the House of Commons has not delivered itself over to the mercy of its own useful instruments. It retains the second reading and the report and third reading stages as vital debating stages, so that the country may focus its attention on a fully representative and wide-open forum, where principle is openly debated and accepted or rejected. This is sound democratic practice.

Some changes of 1946 have been referred to. Something more should be said on these. The increase in the number of the committees and the increase in the time of sittings resulted from the realization by the wartime government, that, whoever was in power after the war, much legislation would be needed. Hence a substantial agreement that the sessional orders should allow for latitude, session by session, experimentally. The Labour government in asking for the change (it fell to it to do so, and it needed parliamentary time for its planning program) prescribed three exceptional practical rules for keeping bills before the whole House. It is interesting to see the bills to which the rules apply: (a) any bill which it may be necessary to pass with great expedition; (b) "one-clause" bills not requiring detailed examination in committee; and (c)

<sup>59</sup> Report cited, p. xi.

<sup>60</sup> *Ibid.*, p. vii, paragraph 11.

bills of "first-class constitutional importance," of the order of the Statute of Westminster. Of course the regular exceptions also apply, and any member may move the retention of any bill on the floor of the House. The government thought that these reforms would yield some 700 committee hours of work as compared with the old average of 190 committee hours in the past.<sup>61</sup>

*France.* Since the Revolution, French parliaments have always had committees as part of their organization, to explore social conditions prior to the creation of law or to revise the work of the Assembly. The difficulty was to prevent the committees from getting too strong and setting themselves in direct touch with the public. In 1848 (in the Republican constitution) it was arranged that the committees, each of some sixty members, should each correspond to a particular ministerial department, and though that desideratum has not been entirely realized, present organization has approximately reached that point. Already in 1848 controversies arose which have reached down to our own day: whether it were better to have permanent committees parallel with the ministerial departments (rather like the American Congressional committees), or special committees which should last only so long as a specific piece of work (like the British House of Commons committees). The former method was, and has since been, attacked on the ground that the committees so organized began to interfere in the work of administration, their interference being fostered by their permanence and their growing expertness.<sup>62</sup> For decades, until recently, permanence and speciality were taboo: but little by little the nature of parliamentary business, and of the deputies themselves, compelled a re-entry on old paths, though of course, with modern improvements. In 1898 there began the practice of creating commissions (committees) to last through the entire term of a parliament—that is,

for four years—and the projects for a systematic organization of their work became very numerous.<sup>63</sup> Permanent commissions were demanded because under the existing system the committees, like the British committees, could develop no traditions and could not devote themselves to a continuous study of a special subject, and because energy was wasted in the dispersal of members among new committees. All this was aggravated by the queer method of constituting the committees. This did not repose upon a party basis, but upon a principle calculated to stultify party leadership and control.

The method of action by *bureaux* (small official groupings for parliamentary business) dating back into *États-Généraux* times and to the Assembly of the *Tiers État* served to defend the Chamber against summary action by the commissions. They were not unlike United States Congressional committees which took the place of party organizations in experimental days. Chosen sometimes by the hazard of the lot or of the alphabet, the *bureaux* were never formed on a party basis! The *bureaux* chose the commissioners.

This haphazard method could be allowed to exist only until legislative business began to be important, and parties to be organized. Often the most competent members on a particular question were thrown together into the same *bureaux*, so that some were necessarily excluded from commissions for which they were especially apt. Chance ruined careers. A deep gulf existed between the commission and the Chamber, because the former grouped men on an entirely fortuitous basis. Sometimes there would be two commissions with cognate propositions studying them in an absolutely opposed sense. The government could never be sure of a clear path for its proposals.

The commissions were made permanent in 1902, and systematized by subsequent amendments of the rules of the Chamber. In 1910 the method of estab-

<sup>61</sup> See First Report, Select Committee on Procedure, October 16, 1915.

<sup>62</sup> Pierre, *op. cit.*, Vol. I, para. 737.

<sup>63</sup> Cf. Bonnard, *op. cit.*, "Notice Historique," p. 87 ff.

lishing the commission by the *bureaux* was abolished in the Chamber. It was not abolished in the Senate until 1919.<sup>64</sup> By these two reforms the modern basis of the parliamentary commissions was established: party composition and permanence. Not till 1946 were the commissions mentioned in the constitution. Yet to 1946 many deputies still maintained that group election is disadvantageous because the group may be very small and contain no one of proper competence for a commission. While permanence in 1902 meant for a whole legislature, reforms of 1920 reduced the permanence to one year. An attack was made on the system of 1920, but was repulsed. The rules of March, 1947,<sup>65</sup> continue the annual term. In practice, members remain for long terms upon the same commission. The commissions were about twenty during the Fourth Republic and had 44 members, appointed by the general vote of the Assembly. Members were nominated by the parliamentary groups in proportion to their numerical strength, but no group with less than fourteen could get representation. This proviso was introduced after World War II in order to prevent the disintegration of party groupings. They were almost parallel with the great ministerial departments, though some cover activities included in more than one department.<sup>66</sup> For reasons of expediency, complete parallelism was rejected in 1920. Parallelism, said the commissioners, would mean the

organization of conflict resulting in the "effacement, to the country's great damage, of the responsible ministry by the irresponsible Commission."<sup>67</sup>

The constitution of the Fifth Republic attempts to diminish the influence of commissions by reducing their number to six (art. 43) (The Government can however decide to send a bill to a specially appointed commission.) These commissions have, as a result, become very large (they include between 60 and 120 members), in order to give to each deputy the opportunity to sit on one of them. They tend to become unwieldy for practical work and break in fact into subcommissions, although on a purely informal basis. The commissions of the Fifth Republic cover several of the fields covered by pre-1958 commissions. They are: cultural and social affairs (120 members), foreign affairs (60 members), defence (90 members), finance economy and plan (60 members), constitutional questions and general administration (90 members), production and trade (120 members). As in the Fourth Republic, they are elected on the basis of proportional representation of recognized groups.

Each commission elects a president, two or more vice-presidents, secretaries and *rapporteurs*. The president is chairman and the official channel of ordinary communication between the members and other official bodies like the assembly and the ministries. The position is much sought after since it is one of authority and influence and has a prestige value. (The president is a member of the conference which sets the assembly's business each week.) It is never held by a member of the government of the day, and that for various reasons: the desire of deputies to keep a check upon the government and to establish offices rivalling the ministers (since there are not enough ministerial offices for all the deputies), and the desire

<sup>64</sup> Pierre, *op. cit.*, Vol. III, para. 711.

<sup>65</sup> Articles 14 ff.

<sup>66</sup> They were the commissions of: economic affairs (customs and commercial treaties); foreign affairs; agriculture; national defense; national education (arts, youth, sports, and leisure); family, population, and public health; finances; interior (Algeria, general administration, and communal and departmental administration); justice and legislation; merchant marine and fisheries; means of communication (railroads, airlines, posts, telegraphs and telephones); pensions (civil, military, and for victims of war and oppression); the press (radio and cinema); industrial production; food; reconstruction and war damage; universal suffrage; the Assembly's rules of procedure and petitions; overseas territories; and labor and social security.

<sup>67</sup> The student may be referred for an extensive alternative treatment to R. K. Gooch, *French Parliamentary Commissions* (New York, 1935).

to support men of experience and expertness, former ministers, former prime ministers, perhaps future ministers. Similarly with the *rapporteur*. This is an onerous office, for the *rapporteur* is responsible for guiding the work of the commission from the standpoint of policy, while that of the president is to guide it from the standpoint of domestic order and its relations with the outside world. The *rapporteur* reports the views of the commission to the assembly (and to the outside world) and then guides the discussion in the assembly, a function undertaken in the first place by the president and then by other prominent members. The position of the *rapporteur* is one much sought after, for it offers the opportunity to acquire prestige in the assembly and with ministers. The name of the *rapporteur* is published in order that those who wish to know how the work is progressing may know to whom to apply. Better to be a *rapporteur* of a commission which has much to do than the president of a commission not in the public eye. The choice of *rapporteur* is determined by the considerations we have mentioned in reference to the presidents. Most often the recognized experts are chosen, sometimes ambitious young men. Upon government bills it is clear that the government can secure a *rapporteur* favorable to its own attitude—he has been called “naturally the organ of the majority”—for the commission is based upon party. But it must be noticed that as the tenure of the commissions and the cabinets do not coincide, their respective party composition and policy can and do contrast with each other, with effects of collision and confusion.

Every bill, whether governmental or otherwise, goes to the appropriate commission; this being settled by the president of the Chamber. Where it is uncertain which commission should be asked to report upon a bill, or where it is desirable that two commissions with cognate fields of interest should be consulted, this is easily arranged by a vote of the assembly: they may deliberate in common, or the

principal commission is instructed to seek the advice of another. The presidents of commissions may request powers of joint deliberation of the assembly. Most important of all in these intercommission operations is the rule and practice that where finance is involved, the Commission of Finances send its special *rapporteurs* to the principal commission, where they take part consultatively in its work. Also, each commission may send a representative to participate in the Commission of Finances during its examination of the credits concerning it.

By what in the United States is called a “discharge rule,” the commissions must report a measure within three months at the latest. Normally the assembly at the committal of the bill states the time allowed the commission. In default of action, the government or fifty deputies may move to discharge a bill. During these months these commissioners deliberate and hold numerous conferences. They must hear the authors of a bill, and the authors of amendments, if they wish—and of course the commissions may and do call them. Members so appearing before the commission can only support their own proposals, but not express their opposition to other parts of the bill, though where the subject under discussion is difficult, the commissions allow considerable latitude in order that subsequent proceedings in the Chamber may be facilitated. Ministries have access to the commissions at any time, and must be heard.

The reports issued by the commission are printed and circulated to members before debate by the assembly. They are usually composed of the following elements: a carefully written history of the problem; an analysis of the immediate social situation which has evoked parliamentary action; a critical description of earlier legislative proposals; a critical examination of the project before it; and its recommendations. There is no doubt in my mind that the French deputy has in this report, if he cares to make use of it,

a far better basis for participation in debate than anything available to his British and as good as his American colleague. He has not only the record of work but also the reasoning upon which it is based. The minority has, however, not been given the right to present a separate report. The commission reports as a single entity. How far the dissentients whose views have not been given systematic expression in the report obtain other opportunities in the assembly we shall now see.

At a date fixed by the president of the Chamber and his colleagues for the settlement of the Order of the Day, the bill is debated unless the assembly decides, as it may, on a vote without discussion. The members of the commission occupy special seats to enable them to act together during the sitting. The *rapporteur* takes the lead in debate and is usually the first at the tribune. The rules give the *rapporteur* and the president of the commission the right to intervene at any time in debate, at their own discretion; that is, they may begin if they wish, may interrupt whenever it suits them, and may make their chief contribution at a point favorable to the success of the debate and the work of the commission. The time of speaking of other members is considerably curtailed, but not of *rapporteurs* or the presidents of commissions. The minority has no official organ, and no special priority in debate; but the convention has been established that a member who speaks in the name of the minority of a commission may be accorded a place out of his registered turn, if the assembly agrees, and it is a courtesy the assembly rarely denies. Further, the minority may have its opinion summarized and published in the *Journal Officiel* at the end of the report of the debate.

The establishment of the Economic Council and the Assembly of the French Union<sup>68</sup> brought changes in the rules regarding the work of the commissions which

were designed to produce proper cooperation. Every commission that handles a bill that has been before the Economic Council or the Assembly of the French Union must extend to their *rapporteurs* a hearing, and if those bodies were not unanimous must hear minority as well as majority views.

Further, the new restrictions on the former powers of the deputies to propose expenditures or reduce taxation (discussed later<sup>69</sup>) have required new stipulations regarding the relationship of the Commission of Finances and the deputies during debate in the assembly. If the consequence of a bill or an amendment is to increase public expenditures or decrease revenues of the nation or of the departments or local government bodies, it cannot be debated according to art. 40 of the 1958 constitution.

Thus the commission system provides a bloc of twenty or thirty fairly expert members before the principal debate commences. Their leaders have a special priority in debate. The time of the Assembly is saved: the possibility of informed debate is provided. Technical questions have been threshed out beforehand, and the principal amendments have been considered. Moreover, as we have already indicated, the commission is vigilant all through the debate, especially in that on the articles, for no amendment can be moved after the bill has left the commission unless the Government accepts it (art. 44 of the constitution of 1958).

The power and influence of the commissions were far-reaching during the Third and Fourth Republics. They have often become powerful enough to challenge the leadership of the government, but their power has there been exerted more through their powers of administrative control (yet to be discussed) and through the annual challenge to the cabinet's budget, than on ordinary legislation. The commissions help to compensate for the

<sup>68</sup> Cf. p. 547 below.

<sup>69</sup> Cf. p. 517 below.

lack of party instinct in France. It must be remembered that French ministries are swift-changing coalitions of groups. It is partly to overcome the weakness of this situation that such a system of commissions has grown up. The commissioners provide the machinery for parliamentary leadership in legislation, and supply a continuity and stability—and therefore an expertness—which short-lived cabinets have not done. Whatever the faults of the deputy, the machinery is good, for it supplies expertness and links the members with others in an active and effective group.

The framers of the constitution of the Fifth Republic diminished the power of commissions. Although the machinery remains the same, the commission has become less influential in guiding the debate on the floor: the Government has a right to insist on its original text being discussed (art. 42). The commission presents its proposals as amendments. In this respect the procedure of the National Assembly resembles more closely than in the past that of the House of Commons. However, it remains different in many ways, consideration of the bill in the House is preceded, not succeeded, by consideration in committee; the examination and report extend to the principle of the bill; the House is guided by the commission and the government, not solely by the government; the alignment on the bill is less a party alignment than in England.

*Committees in the United States.* The committees are in fact the real legislative bodies of the House of Representatives. They have been called the "little legislatures" by the critic <sup>70</sup> who first startled the country with a realistic study of their activity. A famous speaker of the House, Thomas B. Reed, has called them "the eye, the ear, the hand, and very often the brain of the House." <sup>71</sup> The "very often" has,

since Reed's time, been changed into "with inappreciable exceptions."

All bills go to committees—and this means the standing committees, since the Committee of the Whole is hardly used for nonfinancial bills, and even when it is, the business is previously reported upon by a standing committee. The committees are inevitable stages <sup>72</sup> in the progress of the bill; custom has converted them into the chief judges of the substance and forms of legislation. The President's sessional message is divided into its component parts and scattered among the committees; all bills go to them. They have full power over bills committed to them "except that they cannot change the title or subject"; but amendment of a project may essentially change it.

The committee sorts the proposals which pour in and selects those of importance and with a chance of acceptance within the time limit imposed by their short term of office and the necessity of the Senate's consent. Those upon which the party in power insists, or those recommended by the President when he and the majority are of the same party, get priority. The rest are left in the "morgue" (otherwise known as the "inactive list" or "calendar")—the archives which harbor stillborn projects, and this consignment is decisive. Long and ardent controversies against the old rule of unanimous consent for the forced reporting-out or "discharge" of a bill, which placed despotic power in the hands of committees and the speaker, have resulted in some amelioration, but not much. For in spite of the spokesman of the more independent groups within the great parties, the House maneuvered toward very onerous requirements; if a bill has been held thirty days or more, then on two Mondays a month it may be moved that a bill be reported out; the motion must be seconded by a majority of the

<sup>70</sup> Woodrow Wilson, *Congressional Government* (Boston, 1885).

<sup>71</sup> *Jefferson's Manual and Rules of the House of Representatives*, p. 59.

<sup>72</sup> *Manual of Procedure, House of Representatives*, sects. 439, 667.

membership of the House, that is, by 218 members. If this requirement is fulfilled, there is a twenty-minute debate on the motion.<sup>73</sup> The bill can then at once be debated or set for a given date. However, there are rarely as many as 200 members present on Mondays; and even when the motion is successful, time cannot be found by the house to debate the reported bill. Legislation is, therefore, by permission of the committees. Between 1923 and 1939, although thousands of bills were introduced and sent to committee, only 134 discharge motions were ever filed, of which 19 reached the discharge calendar, 13 came up for hearing, and only 8 recalled bills from committee. Of these 4 were passed by the House, but only one passed both Houses and became law—the Fair Labor Standards Act! In the debates the chairman or, if he is not in favor of the bill, the foremost member who is—has a right of recognition prior to all others in the House, and members of the committee are prior to others.

But the committee has no such jurisdiction over amendments as have the French commissions. Nevertheless, the real power lies with the majority party's members of committee, aided and guided by the party floor leader.

*The Government of the United States Congress.* It is manifest that in its committee arrangements Congress has discovered and lodged the true practical leadership of the legislature, if we think of leadership as composed of those who decide whether bills shall be killed or sent forward for debate, what shall be their substance, what recommendations shall go forward with the suggested draft, and when (in collaboration with the Committee on Rules) the bills shall go from them to the House.

Most bills recommended by congressional committees become the law of the land, and the content of legislation finally passed is largely determined in the committees.<sup>74</sup>

<sup>73</sup> The development of this system, with some interesting references to the issues involved, is traced in Chiu, *op. cit.*, p. 258 ff.

<sup>74</sup> Report, Joint Committee on Reorganization of Congress, 1946, p. 2.

The figures previously given (above, Chap. 17 and page 441) indicate the extent of the sifting process fulfilled by the committees.

Hence, the nature of the committees is of crucial importance in the problem of legislative leadership. Four factors have been singled out as critical: (1) the numbers of committees, (2) their size, (3) their expertness or otherwise, and (4) the manner of appointing their chairmen.

(1) The standing committees have been too numerous: forty-eight in the House, and thirty-three in the Senate. Thereby they violated certain criteria of good government. An excess of numbers means that the work of government is disintegrated into unnatural segments, considering that there is a natural unity in all government work. Their terms of reference are therefore too narrow: they needed extension at their margins, to do their work properly. The more committees the more the overlapping, and, therefore, the more the controversies as to the committee which should be seized with a bill. Further, a high degree of parallelism of committees with executive departments is desirable—an even wider field than departmental is desirable in order to coordinate them by Congressional supervision. It is a serious defect also that some members have served on as many as from six to ten committees at one time.

(2) The committees are too small for due national representativeness. They contrast with the legislatures of other countries in this respect: 21 compared with 44 in France and 50 in Britain.

(3) Though some of the committees have had expert staffs to counsel them and arrange their business (for example, the House Appropriations Committee), they have hitherto been understaffed and inexpertly served. If the committees call upon experts from the executive departments, they do so reluctantly and out of the direst need. If they insist on the independence of Congress in legislative leadership, as the constitution provides, they need expert assistants not inferior to the career civil servants.

(4) The chairmen are almost invariably

appointed according to seniority of service in the legislature, provided they have risen in the party ranks. Seniority is no guarantee of ability and still less of sympathy with the times and with the Presidential policy. Yet it is extremely difficult to find another principle of selection. If it were ability, who would define it? It would be definable no doubt by a caucus vote—but this would make the caucus as a whole the master of the assembly. Actually, it would be well if it were so, but as we have seen, the political parties are not cohesive and associational enough to perform this organizing function capably.

If the committees were bigger they would be more restive in relationship to the small gerontocracy. As it is, the seniors of the party become chairmen, while the able young men are almost inevitably put on unimportant committees. The seniors have the patronage; they have acquired positions in the hierarchy of the party machine. Though Congressional rules give them no powers to dominate the committee, the usual powers of chairmanship extend to fixing the time of meetings, the agenda, the calling and interrogation of witnesses, and the latitude allowed the committeemen to ask questions. Above all, the chairmen have power in the off-the-record meetings to shape the report to Congress, backed by the power to recommend to the floor leaders who shall be allowed to speak in debate.

If American political parties were associations founded on principle, if they were more stable, and their sectional interests more harmonized, then the fact that the older men in the party were at the top would not matter. Indeed, in the natural order of things this would be as almost all human institutions are. But the parties are not fellowships of principle. Therefore the seniority of chairmanship actually introduces another obstacle to the development of proper parties. It breaks the potential unison of chairman and followers, and party connection between committees and Presidential legislative leadership. Above all, it obstructs the control of the chairmen by the majority members: they cannot get a chairman removed and

re-elect another. The chairmen of the committees are an incipient, defective, and so far arrested form of legislative cabinet leadership. As such they could be more effective and responsible if party loyalty were stronger, and if they were fully elective (even if not formally) according to party temper and the needs of the time, without the intrusion of an irrelevant but enforced restriction on choice.

It is not easy to discover why the younger members of a party tolerate the rule of seniority. But careful inquiry seems to point to a combination of several factors: (1) The neophyte in Washington does not know his way about; does not know who is powerful in the delivery of administrative and legal favors and who can get bills passed; and does not know the canny uses of procedure. It must be remembered that nearly fifty per cent is the index of turnover at each election in the House, while two thirds of the Senators in 1933 had served more than twenty years in the Senate. (2) The older member of the Congress are also the elders of the party organization. They attract some loyalty for this reason, and in their own states they are powerful in the political machines which may make or mar the career of the younger men. (3) Many of the members of Congress are seniors, and the slightly less senior members support the more senior in the hierarchy so that in time they will be sure of their own rewards. (4) Finally, a custom that has lasted several scores of years is, in itself, powerful.

The reorganization of Congress of 1946 was able to reduce the committees in number, the objective being sixteen in the Senate and eighteen in the House. However, it did not touch the size of committees, which still remain small. It established staff experts for each committee, on a merit and permanent tenure basis. But it could not change the seniority rule, though it sought to reduce its impact by making more regular the procedure of public hearings, their records of business and attendance and votes; and by requiring committee chairmen to report promptly all bills approved by the committee and seek to bring them onto the floor for con-

sideration.<sup>75</sup> Also, it is possible that the Legislative Policy Committee of Majority and Minority as recommended, if meeting frequently, would tend to subject chairmen to the consensus of caucus opinion.

It is regrettable that the passage of the law was followed by only imperfect obedience so far as the number of committees was concerned.<sup>76</sup>

*Hearings.* The most notable difference between the Congressional committees and those of the British and Continental parliaments is that the former may institute hearings in any place where their information is to be found, and they may open their "hearings" to receive witnesses of all kinds. As we have already shown in the analysis of the "lobby," the hearings do speedily attract people with an interest and with knowledge useful to the committee. When the hearings are concluded, the committee proceeds to make its report. The minority has whatever chance of actual concessions the majority is prepared to give it, but it has an unrestricted right to expression and publication of its full opinion in the report.<sup>77</sup> Much more is, however, claimed for these committees: that they cut across party lines in their judgment and drafting of bills, and that party rules less than economic and sectional constituencies. Only the revenue-raising committee, the Committee of Ways and Means, and the Committee on Rules seriously divide according to party: here, the minority is expected not to appear.<sup>78</sup>

"If a department or bureau is involved, its head or his representative usually comes upon request, and in that way there is maintained a much closer contact between the legislative and executive branches than is commonly supposed."<sup>79</sup> Indeed, some Congressional committees habitually

refer their bills to the appropriate government departments for comment, which is not seldom highly effective. Civil servants are called before the committees. Committees have their drafting experts. The President and the heads of departments are in constant touch with the appropriate committees. Also, the committees are permanent accumulators of letters and other communications from the public and the organized interests.

It will be recalled that the Report of the Joint Committee on the Reorganization of Congress recommended (and the Legislative Reorganization Act provided for) expert staffs for the committees not inferior to those sent by the lobby and the executive to influence the hearings.

It might almost be said that the Congressional committee offers, in this respect, one remedy for the unwholesome effects of the separation of powers. How the executive contrives to penetrate the legislature through the medium of the committees is discussed in Chapter 21 in the section relating to the legislative leadership of the chief executive. It should be remembered that the committees wielding the power of the purse have a supervisory power over the administration. This once more distinguishes them from the British committees and likens them to the French. The topic is pursued later.<sup>80</sup> The American committees are still surely too small, especially when we remember the geographical and occupational diversity of the country, and the unrepresentative character of the parties. If, as is true, they are the real legislatures of America, then they ought to be more representative.

#### CLOSURE AND ORDERLY DEBATE

*Closure in England.* Let us consider the situation in England first.<sup>81</sup> Until 1881 closure of debate was left to the speaker and the good sense of the House, and debate was terminated by a simple putting of the question when the speaker considered that it had been suffi-

<sup>75</sup> Public Law 601; sec. 102, 103, 133.

ciently discussed. Indeed, if we consider the procedure of the House in the middle of the nineteenth century, it was directed rather to prolonging than to limiting debate. But already, from 1848 onward, complaints are made in the House that the burden of legislation is so great that limitation is necessary.<sup>82</sup> That is to say, the problem of obstruction of business arose as soon as Parliament was consciously made the instrument of far-reaching social reforms, and "obstruction" was fraught with serious effects. Now, "obstruction" is a relative term, depending for its meaning upon the number and urgency of measures a government wishes to pass compared with the time available. It is used to hold up a specific measure, or a measure is discussed at inordinate length in order to derange the timetable of the House and prevent other measures from ever being discussed at all. This is practiced everywhere.

Yet it was not until the willful obstruction of the Irish Parliamentary party in 1881 that the government began to acquire drastic powers of closure. In that year Speaker Brand, with the connivance of the government, suddenly terminated debate, although there was a large minority against such a procedure.<sup>83</sup> In 1882 the rule was added that the closure could be moved if 200 voters were in favor; or, if only 100 were in favor and 40 only were against, it could be carried by a simple majority. Even then this was regarded as a provisional concession to emergencies, and until 1887 the government demanded closure only twice. In 1887 a rule more in keeping with the pride of the House was established. This was the rule of simple closure, whereby any member might claim to move that the question be now put, when—unless it appeared to the Chair that the motion was an abuse of the rules of the House, or an infringement of the

rights of the minority—it was put forthwith. In 1888 the rule of 1882 was abolished, and the new one was amended by the addition that in a division, at least 100 members be in favor of the motion. This put an important trust in the hands of the speaker, and it has been carried out against the government, though not often.

Since 1887 more coercive forms of closure have been invented which give the government a very strong position. They are known as the "guillotine," and the "closure by compartments" or "the allocation of time." In the first, the "guillotine," the method is to resolve the number of days for debate upon a bill, when, the time being arrived, and notwithstanding the state of discussion or the amount of the bill discussed, the "guillotine" automatically cuts off debate. This was first used in 1887. Closure by compartments or the allocation of time is a procedure at once drastic and yet permissive of a certain latitude to the opposition. For here the government considers the whole of the bill as one plan requiring so many days of discussion, and then offers such and such a proportion of the time for groups of clauses. In this method, if the government is tyrannical, it is possible for it to jump over the clauses which it would rather not have discussed—but, as a matter of fact, the traditions of English parliamentary life, regard for the authority of law, and the fear of future reprisals cause the government to come to some arrangement with the opposition as to the amount of time to be spent on the various groups of clauses. Closure by compartments was first used in 1893. Finally, in 1911, for the committee and report stages it was found necessary to introduce the type of closure known colloquially as the "kangaroo," and officially as the "selection of amendments."<sup>84</sup> This permits the speaker, the chairman of the Ways and Means Committee and the deputy chairman to decide which amendments offered to a bill

<sup>82</sup> See *Report of Select Committee of House of Commons on whether Any Alterations in Forms and Proceedings in this House are Necessary.* 1861.

<sup>83</sup> Cf. Redlich, *op. cit.*, Vol. I, pp. 153, 155-59; John Morley, *Life of Gladstone* (London edition, 1911), Vol. II, pp. 291-98; A. G. Gardiner, *Life of Sir William Harcourt* (London, 1923), Vol. II, p. 423.

<sup>84</sup> Standing Orders, May, 465. In 1919 the Chair was given permanent powers, whereas the Standing Order of 1909 allowed the House to impose this duty only by a special motion of the House. Cf. Debates, February 19, 1919.

shall be debated by the House. This at once gives the speaker the opportunity of ruling out frivolous and obstructive amendments and of discovering, by questioning the mover, how far the amendments raise serious and comprehensive issues.

The introduction of these rules was not accomplished without protest from the private member, the demand for liberty of speech being in the earlier stages most poignant, and the battles long and stern. The answer which was made to their claims seems to me to be incontrovertible. It was:<sup>85</sup>

The principle of closure is an assertion of the principle that the privilege of speech is a privilege which the House permits to be exercised for its own instruction, for its own information, in order to form its own opinion, and that it is not a personal privilege to be used irrespective of the convenience and efficiency of the House . . . If it is true that the privilege of speech is a personal privilege, it belongs, I presume, equally to every member of the House. Every member of the House has a right to make use of it in an equal degree when he pleases, and if every member of the House were to make but a very sparing use of that privilege, the question would very soon be brought to a *reductio ad absurdum*. Well, if the right can only be exercised by a few and by the forbearance of the vast majority of the House, I should like to know on what ground it can be contended that such a right as this is a personal right at all? . . .

On a more recent occasion the argument took this form:<sup>86</sup>

My honorable friend also said that democracy means debate and discussion. That is quite true, but it also means decision; it must be debate and discussion leading up to a decision . . . There are 640 members in this House, and I do not imagine that anyone would propose that rationing should be carried to such an extent that everybody should be entitled to one-640th part of the time of the session, because that might lead to a black market in coupons.

<sup>85</sup> Marquess of Hartington, Commons Debates, 1882.

<sup>86</sup> Chester Ede, Commons Debates, November 4, 1947, cols. 1607-08.

The criticism of such doctrines as these was forcible until about 1902, when the rules of the House were remodelled and what had been, it was thought, temporary expedients were made permanent principles. By that time, both government and opposition had experienced the need for the use of the closure, though the opposition always used the argument of freedom of speech as part of their general strategy. Again and again it is pointed out in the *Parliamentary Debates* that the choice before members was the "guillotine" or the "rack": that is to say, either the sudden termination of debate or the agony of all-night sittings. By 1908 Parliament had sickened under such limitations, it being urged that there was no reality in debate. Further, a Liberal ministry had been returned after nearly twenty years in the wilderness, with a large array of projects of social reform and, therefore, in need of every minute of parliamentary time. Naturally, the Conservative opposition immediately began to inveigh against the immorality of the closure. Balloir observed that between 1886 and 1905, closure by compartments had been used seven times, whereas in two and a half sessions, from 1906 to 1908, the government had used it for as many as ten bills,<sup>87</sup> and Lord Robert Cecil<sup>88</sup> observed that "the future historian of the Constitution would find no more interesting topic than the gradual decay of the corporate self-respect of the House of Commons."

The retort to these criticisms was the inevitable one which Mr. Asquith made, namely, that the government was overtaking arrears of legislation; that it was impossible to work without the allocation of time (and the experience of the last twenty

<sup>87</sup> July 17, 1908, col. 1242. Cf. Lord Hugh Cecil, Debates, March 17, 1913: "It used to be a scandal that the Government proposed these Motions; it has now become a joke. There is a certain significance in that. When you have got to the point when nobody is very angry about it and the thing excites no feeling, the House of Commons must be recognized as having gone one step further down to that abyss of impotence and subservience to the Government of the day which seems every day more ready to swallow it up."

<sup>88</sup> July 17, 1908, col. 1255.

years had taught that common lesson to all governments); that as much justice was done to a minority as was possible, and this by permitting the opposition to discuss the things they most desired.

Perhaps the most serious result of the closure is that Parliament loses the nature of a thought organization and tends to become so plainly a will organization that the opposition and many people in the country are prompted to deny the moral authority not only of the government of the day, but of government in general. For if matters are to be settled merely by superior members, then what is the use of Parliament? Yet the majority could find a reply.<sup>89</sup>

We honestly and sincerely think that these are good bills. We have put them to our constituents, and we believe that our constituents agree with us and that we have a mandate to carry these bills into law. . . . We believe that we have done Hon. Members opposite more than justice in the opportunities which we have given them to oppose the policy which we were returned to carry into force.

Apart from the injurious effects of closure upon the creativeness and interest of the ordinary member, and upon the tendency to undebated and uncontrolled rule on the part of the government, closure has the defect of adding to the difficulties of the speakership. As we have shown, the orderliness of the procedure of the House depends very much upon the impartiality of the presiding officer. But it is difficult to preserve impartiality or the belief in impartiality when so onerous a burden as the choice among amendments is placed upon one man, and when the passions of the House, strongly aroused by modern controversies, are inflamed by limitation of debate. A similar evolution of obstruction, congestion, and closure is observable in the standing committees of the House of Commons.<sup>90</sup> Whether there is any way out of this we discuss presently.

<sup>89</sup> MacCallum Scott, *Debates*, June 23, 1913, col. 882.

<sup>90</sup> Cf. *Debates*, June 19, 1931, debate on the power of the chairman of the Committee on the Consumers' Council Bill to select amendments.

*Closure in the United States.* In the United States a similar process has occurred, and it operates with more tyrannical force because the amount of legislation is so much greater, the division of the session is less rational, and party spirit is less tolerant. The rules regarding the limitation of debate were developed between 1880 and 1890, Speaker Reed in the latter year bringing about a veritable revolution in the rather lax methods used against obstruction until that time. The spirit of the changes was explained by Reed when he said: "The object of a parliamentary body is action and not stoppage of action. It is then the duty of the occupant of the Speaker's Chair to take, under parliamentary law, the proper course with regard to such matters."

There appear to be five principles which give the majority the power, at any time, of overcoming an obstructive opposition. They are: (1) The Speaker may in his sole discretion refuse to put a motion which he regards as dilatory, as for example, to adjourn for a recess or to recommit. As the speaker is the avowed supporter of the majority, this discretion is very liberally interpreted. (2) When a roll call is taken to determine the presence of a quorum, members shall be counted present even though they do not answer to the call. Prior to 1890, refusal to answer to the call was a regular form of obstruction, since the answer was the only accepted evidence of presence, even though the member stood grinning on the floor. (3) Only by unanimous consent can any members speak for more than one hour. (4) The previous question can be moved, and if the majority supports the Committee on Rules, it can be moved at any time!

(5) Finally, the Committee on Rules, upon which the majority has a decisive number, can report at will to the House arrangements for reordering debate and distributing time, and its report is immediately considered if two thirds of the members voting agree; otherwise another day is found. The minority have no liberties excepting those accorded to them by the good grace of the majority. Further, the leaders of the majority party (that is,

the speaker, the Steering Committee, and company) possess the power to decide which of the rank and file shall be permitted to speak. There is ample testimony both from within and from outside the House of Representatives that debate is devitalized. We must add to this account, also, what we have said above regarding the enormous hold of the committees upon the time of the House.

*Closure in France.* In France, the closure is of long ancestry, but as in other countries its use has become of serious moment only in the last two generations and, as an effective weapon for the Government, only since the birth of the Fifth Republic. Before 1958, it was left to the President of the House or to individual members to demand closure;<sup>91</sup> it had to be put to a vote, preceded by at least two opposing speeches lasting no more than five minutes. With the constitution of 1958, it has been given as a right to the Government, who can move it at any moment in the discussion (art. 44). In fact, the new procedure includes both guillotine and closure, since the Government can decide at any time that the House shall vote *en bloc* on the text presented by the Government, disregarding any amendment which has not yet been discussed.

There is also an urgency procedure, which the Government can use, as well as the House;<sup>92</sup> in the latter case, it must be decided by a vote. The whole procedure is then shortened before the commission, and the closure comes into effect as soon as the *rapporteur* and one member has spoken against it. The author of a bill needs fifty supporters to get his urgency motion before the assembly.

*The Order of Speech.* In the House of Commons the speaker has the power to permit members to speak, and the question is, by what rules he guides his discretion. The dictum goes that he who catches the eye of the speaker has the

floor. This is now substantially untrue, being inherited from the time when there was no party organization. Although speakers have defended themselves against the charge that their recognition of members is regulated by the parties, the party whips, in fact, arrange who shall speak because they contrive to get consulted by members, who then inform the speaker of their desire to speak. Naturally, if a debate peters out and exhausts their lists, the speaker then uses his unfettered discretion, calling upon supporters and opponents of the bill or resolution alternately. In recent years the practice has been admitted—at least for what are called “full-dress” debates—and the reasons which have been given are quite comprehensible and not at all sinister. It is convenient for the speaker to know what members are prepared with speeches, and as time is limited, the “most representative men” of different sections of the House may be heard. There is, however, one drawback to the practice. The party leaders would seem to attempt a certain power to ostracize heretics within their own ranks, and this means that perhaps fruitful criticism is obstructed and the authority of the party leaders becomes excessive. Yet the speaker’s reserve of power to disregard the whips—and his authority is plenary—is an important guarantee that the voices of the independent rank and file shall be heard, however unpleasant to the leaders.

In France, members who wish to speak on a measure give in their names personally to the president or the secretaries and are inscribed on one or the other of two lists, *pour* and *contre*, and speakers are called upon in the order of their inscription on the list.<sup>93</sup> It must be remembered that the government has the right to speak at any time, and the presidents, the *rapporteurs*, and the members of the commissions whose report is under discussion are given priority.

*The Duration of Speeches.* It has often

<sup>91</sup> *Règlements*, 1876, article 108 (and Pierre, *op. cit.*, Vol. I, p. 918 ff.); 1915, article 48; 1947, articles 45 and 92.

<sup>92</sup> Articles 61 to 67, *Règlement*, 1947.

<sup>93</sup> Article 43, *Règlement*.

been suggested in the House of Commons that a remedy for congestion is to shorten individual speeches. In 1919 it was calculated that on the first and second readings of the Home Rule Bill, 97 speakers had occupied an average of 41 minutes each, largely spent in repetition of previous arguments.<sup>94</sup> Members have been afraid to take this last step in apparent degradation. They have preferred to rely on good sense. The House regularly shows its annoyance with members who speak for more than 20 minutes, unless they have important material of fresh value. But other parliaments have formally limited speeches. In the Weimar *Reichstag* the maximum was one hour, which could be lengthened for special occasions.<sup>95</sup> In 1926 the French Chamber of Deputies carefully graduated speeches according to the status of the speaker, minister, chairmen of commissions, mandatories of parties, and ordinary members.<sup>96</sup> Observe! The reform was carried when financial disaster threatened. It has not been continued in the procedure of the Fourth Republic.

In America the quality of parliamentary oratory is different from that in England. Congressmen love fine-sounding phrases with which American history, especially of the era of the Declaration of Independence, is full, and love to gush grand principles. Moreover, the size of the House, which is tremendous, and the constant coming and going of members through the swinging doors, give the impression that the member is bellowing in the middle of a noisy fairground. No one takes notice of what a member says, partly because he cannot be heard and partly because the shape of the law has already

been determined in committee. This, perhaps, is one of the causes of the flights of oratory, the principle being that if you cannot say something useful you may as well say something stupendous.

In Weimar Germany discussion tended to be quiet and businesslike save for the grim gusts of class passion which swept across the assembly from the Communist and National Socialist benches, but it is admitted on every hand that discussions in the full assembly were mainly demonstrations for the electorate and were not directed to changing votes.

In France, oratory still has a great appeal and is more frequently denunciatory than helpfully directed to the improvement of its resolutions.<sup>97</sup> This hardly matters so far as legislation is concerned, for, as in Germany and the United States, the principal work is done in the commissions, but it is a serious deficiency in the debates on control of administration. Owing to the lack of party discipline and loyalty, votes are changeable by an apt speech and can be lost by a stupid one. Briand<sup>98</sup> owed his ascendancy to his eloquence, and Clemenceau once fell from the prime ministership by oral clumsiness. The temperament and traditions of the French

<sup>97</sup> Cf. L. Barthou (*op. cit.*, p. 1923), p. 48: "For a speech pronounced at the tribune should be an act; when the discourse or the act has commenced, emotion has already taken another form. A battle is begun, one must win; one has thrown oneself into the water and one must swim towards the bank. Some go under beneath applause, others beneath sarcasm, but the success of an act is not a judgment of its value. The idea vanquished today will perhaps be triumphant tomorrow, and perhaps tomorrow's events may make the orator acclaimed yesterday pay dear for his passing triumph."

M. Barthou (*op. cit.*, p. 62) gives six precepts for speaking in the Chamber of Deputies: (1) Not to abuse citations and not to make excuses for them. (2) Not to affirm one's frankness too frequently. (3) Not to say one does not wish to be a minister. (4) Not to interrupt except necessarily, discreetly, and prudently. (5) Not to hear interruptions and not to reply to them except in the measure in which one may gain from them. (6) Never to strain the voice to enforce silence: wait!

<sup>98</sup> *Ibid.*, p. 50.

<sup>94</sup> Morrison-Bell, *Debates*, February 19, 1919, col. 1057.

<sup>95</sup> Five minutes before the hour, a yellow light-signal flashes out "*Noch fünf Minuten!*"

<sup>96</sup> Cf. *Résolution*, July 15, 1926: article 41, *Règlement (Rapport, Barthélémy, Chambre, 1926, No. 2945)*; *Debates*, 2883 of July 15, 1926). An important commentary is the article by J. Barthélémy, "La Réforme de Methodes Parlementaires," in *Mélanges pour Maurice Hauriou* (Paris, 1929).

chambers produce excitable, restless discussion.<sup>99</sup>

In England and the United States members speak from their places. Being on the floor, they are simply on a level with other members and therefore receive no physical stimulus to speak otherwise than as man to man. In Germany and France the orator may mount a tribune, and there he sees below him and around him an arena full of spectators, and it is generally agreed that this stimulates the speaker to attempt to "show off." Who can avoid self-consciousness (at least) in such a situation?

Further, in England the seating arrangement, by accidental evolution, groups the government on one side and the opposition on the other, a very clear mark being thus made in the "for" and "against."

The House is only seventy-five feet long and forty-five feet wide, which means that the front rows are within little more than an arm's length from each other. There is a drawing-room proximity of all members. The student will enjoy Mr. Churchill's plea for retention of the "oblong" shape of the House of Commons, in rebuilding the bombed assembly. It is true architecture, that is to say, it is political psychology.<sup>100</sup>

<sup>99</sup> Cf. *Ibid.*, p. 71: "The tribune is a great peril, because it is a scene where one plays a part in a hall where the spectators take their part in the piece. Different from a play in this: all is unforeseen—one does not always know how it will open because the Government has the right of intervention at any moment, and may—by an initial declaration which may even bring about an adjournment or the closure—disturb the order of the spectacle; still less can one foresee how it will finish."

"There is an atmosphere whose extremely variable pressure can be registered by no barometer. A breath is enough to make everything change . . .

"These tumults, spontaneous or concerted, this fever, these agitations, these surprises, these incidents, explain why those accustomed to the conditions of the Bar where the dossiers have been exchanged . . . before the blows—why celebrated barristers have failed at the tribune."

"At the Bar there is a discussion, an ordered dialogue, known conditions which fix the debate—at the tribune there is a battle."

<sup>100</sup> See Churchill's Speech, Debates, October 25, 1944.

In the other countries, the seats are arranged in a semicircle, in France and Germany special seats being given to ministers facing the assembly, while in the United States the floor leaders occupy certain seats by the gangways in the semicircle. In the Continental assemblies this arrangement makes a little for confusion and theatricalism, but it is a rather natural result of the group system. The Continental arrangement of writing desks is very bad: it tempts members to conduct their correspondence and write articles or novelles for the press in shelter, while the flaps of the desks can be used to out-rattle speakers. Perhaps consideration for the convenience of orators goes furthest in America, where spittoons (or cuspidors) are arranged along the gangways at proper intervals.

The result of this discussion is, I think, to show very clearly the great extent to which party organization has made itself master of parliamentary activity, ordaining debates and speakers as it thinks proper, so that it may fulfill the promises made during the election campaign. This was foreseen by some, and defended, a generation ago and even earlier, when parliaments became so obviously the vehicles of popular opinion.<sup>101</sup> And now, in

<sup>101</sup> Sir William Harcourt (during the debates on the closure rules in 1882, column 1762): "I believe the Government of this country can only be conducted by Party. If you have not organized Party, what have you got? You have got the caprices and fancies of individuals in a chaos, and the public good perishes in the midst of it. The organization of Parties is nothing less than the predominance of the counsels of those who are chosen by the Party to advise them, because they think they are the fittest advisers. . . . The Party which expects to hold power, or accomplish anything, always must accept the advice of those whom they have placed in the position they hold for the express purpose of advising them; they have made them their leaders for that purpose. To talk of coercion seems to me the most absurd thing in the world. Why, a Leader of a Party—and especially the Leader of a Government—is there by the free choice of those with whom he acts. At any time their breath can unmake him, as their breath has made him. He is their champion, it is true, but he is also their creature."

our time, it is an argument for the most sedulous thought on the improvement of parties.

*Parliamentary Language.* One other thing needs consideration. It is impossible to continue parliamentary discussions except on two bases: *first*, that there shall be quiet during discussion, and *second*, that members shall not use expressions which rouse the temper of the House or impugn the good faith of other members or challenge the fundamental validity of parliamentary institutions in the form created by the constitution.<sup>102</sup> All countries, therefore, have rules to secure these objects. We need not spend time in discussing the details relating to the first, namely, the prevention of disorderly conduct, except to say that at a certain point sessions are suspended or disorderly members expelled from debates.<sup>103</sup> And further, such disorderliness is naturally present wherever differences among groups are deep-rooted, as, for example, in all countries where economic inequality inflames passionate resentment of its attackers and

defenders, and further, where racial or religious differences are strong.<sup>104</sup> Sometimes these and other differences may be so drastic as to make the parliamentary method entirely impossible, as for example, in the Weimar *Reichstag* when Nazis and Communists attained great strength. Or personal vanity or uncontrollable natural impatience may sometimes be too sensitive to permit quiet discussion, as in France and Italy.

As the inevitable time comes when the majority throws off its bonds and enforces its social policy, "unparliamentary" expressions become more common. What concerns members is not so much that they are uttered, but that they are often true. Yet the truth may often be thought, but not be told; for the whole of parliamentarism is an edifice of conventions erected on a very fragile basis of civilization. This theme recalls the right of revolution which has been denied written expression in the constitution by most political scientists, lest men should fly to that as the first, and not the last, resort.<sup>105</sup>

<sup>102</sup> Cf. May, *op. cit.*, p. 431.

<sup>103</sup> Cf. May, *op. cit.*, p. 440 ff., and Standing Order 19. Cf. Vogler, *Die Ordnungsgewalt der deutschen Parlamente* (Hamburg, 1926); Zschucke, *Die Geschäftsordnungen der deutschen Parlamente* (Berlin, 1928), *Geschäftsordnung* 89-94; Pierre, *op. cit.*, para. 484 ff.; *Manual and Rules of the House of Representatives*, section 359 ff. On the Continent, suspension of sessions is frequent; in Anglo-Saxon countries, it hardly ever occurs.

<sup>104</sup> E.g., in Poland and Serbia; while in the Southern states of the United States, racial prejudice is so strong that it has excluded the Negro race from discussion altogether.

<sup>105</sup> E.g., Kant, *Principles of Political Right* (trans. by Hastie, 1891), p. 50: "For, such resistance would proceed according to a rule which if made universal would destroy all civil constitutionalism, and would annihilate the only state in which men can live in the actual possession of rights. . . . The prohibition of them [insurrections] is therefore absolute."

## *Financial Legislation; Delegated Legislation; Legislative Control of the Executive*

### FINANCIAL LEGISLATION

So far, we have concerned ourselves only with legislation on ordinary matters. There is still something to add in regard to legislation where finance is directly involved. Here let us enter one warning. Recent discussions of legislatures have placed more importance upon what is called "financial" legislation—meaning the laws which directly vote supplies or affect taxation—than upon other laws. Yet it is clear that bills of the former character are only the logical consequence of ordinary bills which create services and institutions for which payment must be found, especially in an age of drastic economic reconstruction and a governmentally planned economy. Consequently, there is no fundamental reason why these bills should be differentiated, since it often happens that ordinary legislation imposes the burdens. However, in the historical evolution of parliamentarism, procedure upon financial bills was conceived not simply as a method of securing economy but also as a means of checking the power of Crown or ministers and of vesting in Parliament the power to stop the whole machinery of government should its will be thwarted.

It should be noticed that contemporary financial legislation is simultaneously and often deliberately used as a legislative instrument for controlling administration

and the executive, being the most powerful one among the instruments used to effect this control.

*British Financial Legislation.* The British system rests upon law, practice, and the rules of the House of Commons,<sup>1</sup> and its foundations are: (1) that no one except the responsible ministers of the Crown may originate a new charge or increase an existing one; (2) that the House will not grant money unless the demands are initiated in committee of the whole house; (3) that these stages are complex, not simple; (4) that debates upon the regular annual financial legislation take place within a space of time allocated broadly but definitely by the Standing Orders; (5)

<sup>1</sup> Cf. T. Erskine May, *Parliamentary Procedure* (14th edition, London, 1936), Chap. 24; A. J. V. Durell, *Parliamentary Grants* (London, 1917); W. F. Willoughby, *Financial System of Great Britain* (New York, 1917); E. Hilton Young, *System of National Finance* (London, 1936). For historical account: House of Commons, Eleventh Report, Select Committee on National Expenditure, 1944. For simplicity I omit the discussion of the supplementary votes and votes on account; also the distinction between Consolidated Fund and Supply Services. Nor do I enter into the question of the proportion of annually variable taxation to that which is more permanently settled. The general theory of budgets is best treated in G. Jéze, *Cours de Finances Publiques: Le Budget* (Paris, 1922); and, further, in other matters regarding public finances, in his *Cours des Finances Publiques* (Paris, 1935-36). In English there is C. F. Bastable's *Public Finance*, 3rd edition (London, 1917).

that appropriations made by Parliament are specifically assigned to object and time; (6) that there is a retrospective survey of the legality and economy of the appropriated amounts. Let us consider each of these a little more closely.

(1) Around the rule of government responsibility revolves almost all the excellences and all the defects of financial procedure. It is the residual deposit of all the constitutional currents which, in the course of centuries, have transformed a monarchy into a virtual republic.<sup>2</sup> A compromise has retained the name of the Crown to support the independence of the cabinet and to limit the chaotic results of parliamentary initiative, and at the same time has transferred to the popularly responsible cabinet the real initiatory power. The Standing Orders of the House (Numbers 63 to 70) embody this. Standing Order 63 reads:

This House will receive no petition for any sum relating to public service, or proceed upon any motion for a grant or charge upon the public revenue, whether payable out of the consolidated fund or out of money to be provided by parliament, unless recommended from the Crown.

Perhaps the most noteworthy feature of this arrangement is that it is pure usage and self-control upon the part of politicians: no external authority, no statute, ordinary or constitutional, imposes this rule of behavior, which differentiates the British system from all others.

How is the rule implemented? The responsibility of asking for money is put upon the government: it is the spender. It produces annually a complete set of proposals for expenditure, known as the Estimates, and proposals to cover the total sum by taxation, in the Budget, where the expenditure and revenue are balanced. Very complicated and important processes precede the government's advent before the Commons. The Estimates begin to appear before the Commons in February preceding the April 1 which begins the year for which they have been calculated. They have undergone long gestation, and

it is true to say that although the final battles and establishment have occurred in autumn and winter, they have been the subject of a continuous year-round process of excogitation and arrangement within the Treasury, for they are far too involved, and too large and too disturbing, to be improvised: £800,000,000, in 1938 (and £3,181,000,000 in 1947-48) and thirty large and voracious departments!

If the ultimate net effect is to be that every penny is spent to the maximum social satisfaction, it is clear that there must occur a process of adjustment among the departments and a process of adaptation to economic circumstances and the relationship of political forces. Especially urgent is this budgetary planning in modern nations which raise a vast sum from the economic product each year, thus powerfully influencing the whole economy, labor and investment incentives, and consumption habits. Further, the fiscal instrument is now used to combat depressions.<sup>3</sup> This necessitates three things: considered comparison of diverse claims for expenditure; considered relationship between the total of admitted claims and the total available resources; and, as an inevitable corollary in a day of highly complicated and extensive state activity and changing ministers and parliaments, a permanent organization to secure the first two factors. These three are provided by the institutions of review and control of the estimates of the spending departments by the Treasury, with the Chancellor of the Exchequer at its head; by the Chancellor's power of censorship, with the departments' ultimate appeal to the cabinet; and by the Treasury, the department of finance. Moreover, upon these is fixed, clearly and ultimately, the responsibility for financial soundness: for the House of Commons can only directly interfere to reduce, not increase, the estimates produced by the government.

<sup>2</sup> Cf. Alvin Hansen, *Economic Policy and Full Employment* (New York, 1947); *Employment Policy*, British White Paper, May, 1944; *Economic Reports of the President* (published by the U. S. Government Printing Office annually, in January and June).

<sup>3</sup> Best described in A. J. V. Durell, *op. cit.*, Chap. I.

(2) It is the second fundamental practice of the constitution that financial legislation originates in the House of Commons, and, further, it is a settled observance to resolve upon grants of money and impositions of taxes only in committee of the whole House. The House once tried the experiment of sending estimates to a standing committee by rules adopted in 1919, but the practice was dropped after one session because it was generally felt that the estimates were too important to devolve to a committee.

The proceedings in committee of the whole House possess three qualities, which may be considered merits or defects according to the angle from which they are viewed: the House has slightly easier rules of debate; the whole House is formally in charge of such vital matters as grants of money; and the necessary resolutions that the speaker leave the chair give the opportunity for general debates on governmental policy. The most important characteristic of English procedure at this stage is that it does not entrust the estimates or the tax proposals to standing committees as do the legislatures of France, Germany, the United States, and other important countries, but insists on their consideration by the whole House. Moreover, owing to the English party system and the existing body of tradition, the government as a whole, the various ministers during discussion of the estimates, and the Chancellor of the Exchequer at the tax-proposal stage are in charge of the House and are, invariably, its masters. No one is strong enough to compete with them—neither an independent parliamentary commission of finances as in France or Germany, nor the members considered individually. The House, organized as the Committee of Supply, discusses the individual estimates, votes a sum of money "not exceeding" so many pounds, and this is afterward converted in the ordinary procedure of the House into a vote. All the votes together are gathered annually into a single Appropriation Act. The Committee of Ways and Means comes into existence about the same time, but a little later, to give effect to these grants

by authorizing the government actually to spend the money granted and to designate and provide it with the sources of revenue. Thus there is a dual control by the House, and its work is summed up in one Finance Act, which includes the annual taxes and the changes in the permanent ones, and one Appropriation Act which enacts the grants, authorizes the expenditure, and assigns the money required to each item.

(3) and (4) What are the main features of this process? *First*, it is clear that if the estimates were left to the tender mercies of the opposition, the House might never cease debating them, and, indeed, until 1902, the arrangements obstructed rather than facilitated the work of the House. Since 1902, twenty days were allotted to the Committee of Supply (before August 5), though an extra three days might be added. In October, 1947, after much discussion by the Select Committee on Procedure, the House decided on a total of twenty-six days, but no longer allowing certain extra days available before.

*Second*, the House sees the estimates only very shortly before the day of discussion.

*Third*, the House may vote a decrease of the estimate but not an increase, though it may "suggest" extra expenditure. The consequences for the individual members of the House are serious: members can do no more than enter upon a general, scrappy, and rather vague discussion of the government's proposals. To offer to decrease an estimate is tantamount to a vote of no confidence, and is, indeed, the formal resolution upon which discussion turns. It cannot be carried, and therefore the discussion loses its sharpest sting. To offer the increase of an estimate might be desirable but is legally impossible, and perhaps, on the whole, it is best here that the government should have considerable independence.

*Next*, the members are incapable of any significant control of the estimates in the sense of "value for money," owing to the shortness of time available for their examination and also the form in which they are couched. Even if the estimates

were put into a clearer form, they are so voluminous, and each item represents so highly technical a set of circumstances and inwardly technical relationship with all other items, that the discovery of the true connection between the figures stated and the real nature of the values represented would demand years of application and expert tuition. But only days are available, and of them but a few.

After various experiments aimed at more effective control of the expenditures through parliamentary committees, a Select Committee on Estimates, annually reappointed, was established in 1920. It consists of twenty-eight members, may work through subcommittees, may examine any estimates presented to the House, and may report "economies consistent with the policy implied in those estimates." In 1926, it was given the assistance of a Treasury official. Though its work has been useful,<sup>4</sup> it still suffers from

<sup>4</sup> Its World War II counterpart, the Select Committee on National Expenditure, issued a long series of very valuable and effective reports on the multifarious problems of administration in time of war. It secured much the same range of power as the Estimates Committee, but since the financial votes were blank, for security purposes, the House was the readier to support its power of investigations into what its chairman, Sir John Wardlaw-Milne, habitually calls "seeing that the nation gets value for money." It consisted of thirty-two members, and worked through subcommittees. It paid visits to the government's field agencies. Its success largely depended on the time it spent on its work, and the specialization and businesslike methods of its small subcommittees. In six years it held 1740 meetings, that is, about 300 per session. (As a contrast, the Estimates Committee sits twice a week.) Its success was due also to the fact that the House of Commons supplied it with a staff of clerks who became expert and who were able to cooperate smoothly with the officials of the departments that were investigated. The present author testifies to the enormous public value of the many reports. The committee scored many successes that were not known to the public, because it disclosed findings to ministers privately in order that military secrets should not be divulged, the government hampered, or public morale depressed while administrative improvement was being secured. For an account see Third Report, Select Committee on National Expenditure, October 31, 1946, evidence of former chairman, cited p. 206 ff.

certain natural results of the parliamentary cabinet system. It has not the time, even superficially, to examine more than two or three departments each year: therefore it can only be of small use to the House, and only of occasional effect in frightening a department into economy. Not all of its members give the service to it that is desirable. It has not used subcommittees. It cannot take retrospective views. It sometimes makes recommendations which omit elementary facts. It cannot secure settled days for the discussion of its reports, for an important reason already observed: that is, that the discussions on policy and the courtesy of Parliament have given the opposition leaders one of its all-too-rare privileges of choosing the subject of discussion. Are these to be limited?

Thus Parliament is still largely undirected in financial legislation. Nor is it helped by the form of the estimates. Until 1927, indeed, the votes were put together without any uniform principle; the subject matter of the vote was the original principle, but this was not always followed when innovations were made. In 1926 the Select Committee on Estimates recommended a grouping into a number of services,<sup>5</sup> each containing the appropriate departments, and advised that services done for the departments by others should appear as a footnote. This was adopted and has promoted clarity. Yet other proposals—such as those of Sir Charles Harris of the War Office, to produce estimates of units of cost in the various departments (say, a hospital, a horse, a lorry driver, etc.) and thereby facilitate comparison and therefore understanding and criticism—have only a very limited application. For in the first place, units are not so easily discoverable, and when so, they are only formally the same, for it is the vast hinterland of many subtle but concrete differences that makes the difficulty of financial control.

The plain truth is that members of the House of Commons lack the two things

<sup>5</sup> Cf. First and Second Reports from the Select Committee on Estimates, Nos. 59, 119 of 1926.

which would give them financial control: time, and a great deal of it, and expert knowledge of the details of everyday departmental administration as well as financial insight. The Treasury has both of these, as it is permanent and professional. The time of the House can only be increased by reforms such as those discussed later, and principally by the multiplication of committees. Its expertness may be increased, but only to the point of spurring and curbing the administration, and even this very weakly. The amount of time available in the Committee of Supply for discussion of the estimates has certain necessary results: discussion must be superficial, and it can touch upon only a fraction of the total estimates, while others are simply accepted in the division lobby without a single word of discussion. Debate has, of course, become merely a general challenge of the main policy, its principle and general features, pursued by the government, and the government's general answer thereto.

This means that the Treasury is the first-line controller of economy in government: government, a vast apparatus employing nearly one million people and spending over three billion pounds a year after World War II.

Another basic principle of the British financial system is that (5) the Appropriation Act does not compel the government to spend the money granted, that is, merely their maximum. But any unspent balances cannot be used at the discretion of the department which has received the grant, but is returned to the Exchequer. This *annuality* secures the control of the Commons if it should ever be in a situation where such a drastic control were necessary. Further, since 1689 there has developed with more and more minuteness, the principle of the specialty of appropriations.<sup>6</sup> The Estimates appear in a detailed classification of classes, votes, and subheads, and, except under conditions, this classification regulates upon what things the department may legally spend. Yet, what if calculation could not exactly

estimate the amounts required in each unit? May there not be a diversion of funds from one to the other? Such a course is dangerous, as it may open the way, if uncontrolled, to a flouting of Parliament. Diversion, or *virement*, as it is technically called, is permitted on condition. In the case of votes for Civil Estimates no *virement* between them is at all possible: in that of the army and navy, the Appropriation Act annually lays down conditions of *virement* between votes with the sanction of the Treasury.<sup>7</sup> As regards subheads, these are purely informative and the House resolves only the votes. The departments are therefore free to divert from one subhead to another, but in order to avoid undue liberties and the mystification of Parliament, Treasury sanction must be obtained, and the Treasury acts strictly, sanctioning only allied subheads in the case of the Civil Estimates.

(6) The control of the executive, and to some extent even of the Treasury, is served by two institutions: the Office of Comptroller and Auditor-General, and the Public Accounts Committee.

The Comptroller and Auditor-General, whose office was created by the Exchequer and Audit Act of 1866, serves two functions: the control of monies from the Consolidated Fund, and the audit of accounts. Pursuing the first function, the Comptroller permits issues to the Treasury (which then permits the money to pass to the paymaster-general and thence to state creditors) only after review of the authority for such issue. This is a power, which not altogether, but almost so, prevents the misapplication of money. Pursuing the second function, he audits the accounts of issues made yearly, certifies the accounts, and reports to Parliament. He is concerned with the proofs of payment and with the proper expenditure of the money. Further, the Comptroller reports not only upon legality but upon the wisdom and economy of expenditure; that is, he is concerned with waste in so far as it is to be detected:

<sup>6</sup> Cf. Willoughby, *op. cit.*

<sup>7</sup> Durell, *op. cit.*, p. 283 ff.

I do not feel myself debarred from calling attention to anything which has occurred in the course of my audit during the year which indicates loss or waste, or anything of that kind, which I think it is well that Parliament should know . . . if I find the result of administrative action has been a loss or wastefulness of public money, then I think it is not going beyond my duty of reporting, as an officer of the House of Commons, if I call specific attention to matters of that kind, even though the account itself would not disclose the facts . . .<sup>8</sup>

In other words, within the executive system itself, Parliament has placed a permanent executive officer with the task of controlling the executive elements engaged in spending: It has provided for an officer as continuous and as professionally interested in legality and economy as they are in spending. His legal status is of the essence of his utility. He is appointed by the Crown, during good behavior, is removable only on a joint address of both Houses of Parliament. His salary is a charge, like that of judges, on the Consolidated Fund. He has a judicial status. He reports to Parliament. In short, he is, in reality though not formally, a servant of Parliament, to control the executive; and he has a position independent of the executive whom he is to control, even of the Treasury. His reports are of the highest importance, for they, by anticipation, prevent illegality and, retrospectively, discover illegality and criticize wastefulness. Nor is this all: the Comptroller is aided by, and in turn aids, a special organ of the House, the Committee on Public Accounts.

It is clear that parliamentary control is imperfect unless it receives the report of the audit of public accounts, and more, unless it proceeds to an examination thereof. Until 1861 such an examination was spasmodic and badly organized.<sup>9</sup> Since 1861 a Committee on Public Accounts has been set up every session "for the examination of the accounts showing the appropriation of the sums granted by Parlia-

ment to meet the public expenditure." When the Comptroller and Auditor-General were established, the circle of financial control was complete.

The Comptroller is advisor to the chairman of the committee.

I always attempt, as far as possible, to reserve final judgment. My reports are intended to enable the committee to scrutinize the matter with the assistance not only of the Accounts and my reports but by oral cross-examination as well.<sup>10</sup>

The composition of the Committee on Public Accounts is important. It consists of fifteen members. Its chairman is a member of the opposition, sometimes a former financial secretary to the Treasury, and the rest of the members are distributed according to the party composition of the House. It examines the reports of the Comptroller, who personally helps it, and Treasury officials are also present. It may, and does, call for department accounting officers and whatever information it finds appropriate. Thus it is enabled to penetrate the financial and administrative fastnesses which are closed to the amateur. Its investigations, as any one of its reports will show, are very thorough. Finally, it reports to Parliament, which sometimes discusses the reports. Far more important than parliamentary discussion, even on its rare occasions, are the Treasury minutes which embody the chief reformative findings of the committee and go, like barbed arrows, to the culpable departments.<sup>11</sup>

Now it is true that the Committee on Public Accounts acts not only retrospectively, but late: for the Comptroller's reports do not reach Parliament until one year after the expenditure has been incurred, and only about a year after this can the committee report. However, departments do not like the smart of public censure, or Treasury reprimands. When matters are indefensible, the pecuniary responsibility of one or other official may be

<sup>10</sup> Report, 1946, Question 4302.

<sup>11</sup> Cf. the interesting Treasury document called *Epitome of the Reports from the Public Accounts Committee, 1857-1925* (1927, No. 161).

<sup>8</sup> Report, 1903, Question 756; and Report, 1946, Questions 4163, 4242, 4259 ff.

<sup>9</sup> Cf. Durell, *op. cit.*, Chap. III.

## LEGISLATION

involved, for in extreme cases the committee may recommend disallowance. The Treasury itself may be challenged for permissions or prohibitions for which it is responsible. One committee chairman said:<sup>12</sup>

There is a great deal of human nature in the world, and fear is one of the greatest helps in keeping men straight. The fear of the Public Account Committee, and the very searching examination that takes place there, does a great deal to help in the path of rectitude the members of the civil service.

On the whole, then, in England the cabinet is mistress of finance. It is indubitably responsible for it, while the Chancellor of the Exchequer is, above all, the controller of expense. The control exercised by the House of Commons lies between the almost impossible margin of overthrowing the government on policy, and tinkering with small economies, in the main retrospectively. Suggestions to reinforce the power of the House of Commons are dependent for their efficiency upon more time and expertness of its individual members. Should they go far, they would damage the independent expert economy of the Treasury (which is universally lauded as of the highest value), and the power of control and responsibility, the concentration of which in the cabinet is the best guarantee of the maximum economy.

The vast increase of public expenditure and the multiplication of the agencies of public administration have left the House of Commons perturbed about financial control. In 1946 it was proposed<sup>13</sup> that the Estimates Committee and the Committee on Public Accounts be amalgamated into a single Committee on Public Expenditure. The reasons advanced were that both these committees deal with the same subject matter, though the former deals only with the current estimates while the latter reviews the accounts of the past year after they had been audited. Both, again, were compelled to range back-

ward or forward, wherever comparisons were necessary for effective judgments. It was possible in the existing system to have gaps not surveyed in useful time by either committee. The fact that the chairman of the Estimates Committee is a member of the Committee on Public Accounts was not regarded as an adequate provision for cooperation. The experience of the Committee on National Expenditure during the war led to the conclusion that a larger committee than either of those in operation would permit sub-committee operations, expert staffing, and specialization, and therefore effective services to the House of Commons whose weakness in grasp of financial detail had been demonstrated. It was intended that the Comptroller and Auditor's status should remain unaffected either in relation to the departments or to the committee.

The proposal was strongly resisted by, among others, spokesmen for the government, especially when it was suggested that one of its merits was that the committee would develop a staff of experts. The fear was expressed that they would inevitably move into the criticism of policy, which was the concern of the government and the House of Commons, and would be tempted to intervene in everyday administration and produce troubles for the executive and conflicts between the House and the government departments. The government spokesman said:<sup>14</sup>

A committee such as is suggested would place a very heavy burden on senior officers, and inevitably hamper the efficiency of executive action by importing delays and cramping initiative . . . The fear here was that the Public Expenditure Committee would be liable, as was the Select Committee on National Expenditure in the war, to drop on Departments about current activities . . . If that is so, and they are liable to send for officers of Departments at any time about something or another that they think they should take an interest in, then the officers are liable to be pulled up at any time, and possibly examined, about current administrative matters. That has two consequences. (1) It is liable to be a

<sup>12</sup> Debates, 5th series, Vol. XXXVII, p. 424.

<sup>13</sup> Third Report, Committee on Procedure, October, 1946, Nos. 189-91.

<sup>14</sup> Cf. *ibid.*, Herbert Morrison, evidence, *Questions*, 3245 ff.; and Government Memorandum.

drain on the time of the higher civil servants, and an interruption of their work. (2) It is a little bit liable to make them lose their nerve; because if they have a Minister chasing them around day by day and a committee of Parliament liable to drop on them any day about something that is happening at the time, they are a little nervous as to who their master is; and one of the things which is very important about the Civil Service is that you should not make it dictatorial on the one hand, and you do not want to make it too nervy on the other—because once it gets nervy it loses confidence and dithers . . .

Then we get into the argument as to who is responsible for executive current administration, the Government or Parliament. I say it is the Government that is responsible. It is responsible to Parliament, but if Parliament is going to set up another duplicating set of administrative experts to take an interest in current administration, there is going to be a clash between Parliament and Government which I think would be bad . . . Parliament's business is to check the Government, throw it out if it wants to, go for it, attack it, criticise it, by all means, but Parliament is not a body organised for current administration—not in this country. They have had a go at it in France, and the United States, and I do not think too much of it.

The government resisted the proposal successfully.

Other countries desire the main principles which underlie the English system: clarity of the budget, considered discussion, and responsibility of a single authority for proposals of expenditure, but for various reasons have hardly attained it.

Weimar Germany came closest to English practice. Weimar procedure was regulated by articles 85 to 87 of the constitution and the *Reich Budget Order (Reichshaushaltsordnung)* of December, 1922, a law passed with the majority required for constitutional amendment, and again amended in March, 1930.<sup>15</sup> These were the principal legal dispositions concerning the budget and the examination of accounts, but the rules of procedure of

the *Reichstag* and the *Reichsrat* were also of importance, since they established standing committees to deal with proposals for expenditure and taxation. The net effect was to secure the completeness, the unity, the clarity and good faith, the specialty of appropriation, of the annual budget, and its previous acceptance by Parliament. Upon certain things doctrine, rather than law, had its uncertain work, as in England; in particular, in the thesis that the money voted by Parliament was a maximum; that, according to the principles of sound public finance, this was not a command to the government to spend, but only permission; and that the government should spend only as economy required. Both academic and parliamentary controversy revolved around this. Further, the principle of economy, which in England is not legally stated but is in practice applied by the Treasury, was definitely stated in article 17 of the *Reich Budget Order*: "Only such expenditures may appear in the budget as are necessary for the maintenance of *Reich* administration or the fulfilment of the duties and legal obligations of the *Reich*," and further, article 26 declared, "appropriations (*Haushaltsmittel*) are to be administered efficiently and economically (*wirtschaftlich und sparsam*)." These clauses, in fact, were submitted as the written foundation for the doctrine that the government need not spend the appropriations. To secure economy, the law gave the Minister of Finance special rights and obligations which were hitherto vested in him by convention. A cabinet resolution of October, 1923, required that he be consulted by his colleagues whenever projected statutes or administrative measures had financial consequences and gave him the right to send inspectors into the departments and require reforms—all, of course, with the right of appeal to the cabinet. Article 21 of the *Reich Budget Order* and article 32 of the rules of procedure of the cabinet gave the Minister of Finance a legal priority over other ministers, and probably they formulated what in fact occurs in England.

<sup>15</sup> Cf. R. Schulze and E. Wagner, *Die Reichshaushaltsordnung*, 2nd edition (Berlin, 1928), with Appendix on reforms of 1930; Kühnemann, *Haushaltsrecht und Reichsetat* (Berlin, 1930).

Expenditure and observations whose acceptance in the Budget the Minister of Finance has rejected, are subject to the vote of the Cabinet upon the motion of the competent Minister, only, however, if matters of principle or otherwise appreciable importance are concerned . . . If the Cabinet votes against the vote of the Minister of Finance to exclude an appropriation or observation, then the Minister of Finance has a right to protest. The appropriation or observation can then only be put into the Budget if this is resolved in a further vote by a majority, and when the Chancellor votes with the majority.

This, of course, was entirely subject to the combination of parties in the cabinet: and when the Minister of Finance belonged to a tactically weak group his formal supremacy was as nothing, and, in fact, the ministership of finance went to the Chancellor's party or to an expert from outside Parliament.

The parliamentary stage differed from English procedure. The government approaches the *Reichsrat* first, and this had full powers of amendment and rejection. In the *Reichstag* there were three readings, the first reading being the great demonstration like the English budget speech. Only the principles were discussed, however, and then the bill went at once to a standing committee (number 5) on the budget, called the Chief Committee. It consisted of thirty-five members, corresponding to the party strength in the *Reichstag*. This was the principal stage of money bills. The estimates were here discussed for months, with the appropriate ministers, officials, economy experts. All the necessary documentation, library facilities, and secretarial aid were available; and for specially difficult and involved questions, a permanent subcommittee was employed. The second reading was a discussion on the committee's series of reports. The third went over the ground again, beginning with a general discussion. There were no criticisms on the work of the committee: ministers were in command and were responsible, and certainly with a group system and an unrestricted right of financial initiative on the part of private members, chaos would have followed any freedom in the full *Reichstag*.

The great obstacle to parliamentary control of financial policy in England was absent in Weimar Germany: the convention that the government alone is responsible for it. There was theoretical controversy over the right of the parliament to initiate increased charges, but there was more about its right to increase or decrease expenditure. The second reading in the full *Reichstag* was considered a waste of time and prevented a speedier voting of the budget without any compensating benefit. The right to initiate or raise expenditure was also censured, and the English rules regarding this were praised in the *Reichstag*,<sup>16</sup> for as the rules of the *Reichstag* stood, amendments could be moved on the second and third reading without previous examination by the Committee of the Budget. But Germany, like France, suffered ultimately not from defective rules but from an anarchical party system. Though, in Germany, this anarchy was not so old as in France, its fruits were such obstruction to the annual financial legislation as to produce emergency decrees and a dissolution of the *Reichstag*, and public shame had to accomplish what public spirit was first too weak to do.

France. French financial procedure to 1946 has long been a byword among the connoisseurs of parliamentary pathology.<sup>17</sup> Although French theory is of remarkable excellence and clarity, here, again, the rules are better than the spirit in which politics are conducted. As we have seen, the two vital points around which any sound procedure revolves are the independence of the Minister of Finance and the self-control of the legislature: the former requires a strong cabinet, the latter strong parties. In both these things France is defective. The long strug-

<sup>16</sup> Moldenhauer, Minister of Finances, *Reichstag*, May 26, 1930. Cf. also W. Dorn, *Bericht des deutschen Juristentags* (Salzburg, 1928).

<sup>17</sup> Cf. G. Jèze, *Cours de finances publiques: Le Budget* (Paris, 1922), and *Cours de Finances Publiques* (Paris, 1935-36); E. Allix, *Traité Élémentaire de la Science des Finances* (6th edition, Paris, 1931); and for a popular exposition, G. Bonnet, *Les Finances de la France* (Paris, 1924).

gle between legislature and executive in the nineteenth century naturally impelled the deputies to demand complete parliamentary freedom in financial matters: freedom to raise and lower appropriations and taxation, to amend or reject the budget, to tack all sorts of general reforms to financial grants, to discuss projects without limitation or coherence, and to attach interpellations to the financial resolutions. This led to intolerable abuses: the humiliation of the government, the voting of uneconomical appropriations to impress the country and win the support of organized groups, the retardation of the annual votes, and the destruction of a single responsible authority.

In 1911 and 1920 important reform of the rules of procedure occurred. (Note that in both these years there was a strong majority on the side of reform and that in both years, also, national and international difficulties compelled reform.) In 1911 it was forbidden to attach interpellations to the discussion of the budget, and additions to expenditure could henceforth be debated only after report by the Commission of the Budget; and a time limit was set to speeches. This had little effect. The trouble was more deep seated. Hence the reforms of 1920.

In regard to the Finance Law no amendment or additional article tending to augment expenditure could be put after the three sittings which follow the distribution of the commission's report in which the relevant chapter appears. No augmentation or diminution of expenditure could be proposed simply to raise a debate on ministerial policy (*à titre d'indication*). This was a notorious vehicle for parliamentary exhibitionism as well as the occasion for bona fide but untimely debates on administration. When an amendment or additional article fell within the competence of one of the permanent commissions and was endorsed by at least fifty signatures, it was sent to this commission if the Commission of the Budget or the government required it. This was in order to secure at least some expert discussion on the matter before the Chamber debated the matter, and even to

get impertinent demands postponed or settled. No proposition tending either to augment salaries, indemnities, or pensions, or to create services, employments, or pensions, or their extension outside the limits of the law already in force, could be made in the form of an amendment or article additional to the Finance Law. The discussion of the budget could not be interrupted by certain resolutions.

Outside these restrictions, of course, the deputies could initiate increases of expenditure and taxation (while in the House of Commons the prohibition is, for private members, absolute). The abuses arising out of the right of deputies to propose additions of expenditure to the government's budget may be appreciated from M. Tardieu's statement that in little over a year he was bombarded with proposals amounting to the expenditure of 15,000,000,000 francs! Such proposals worry the government and strangle parliamentary proceedings. Hence, in February, 1934, partly as the result of the fears inflamed by the riots early in that month against the legislature, a new rule was adopted (article 73, Finance Act). Every project requiring increased expenditure or decreased revenue must provide for "collateral revenue, apart from the proceeds of loans, which are not already authorized in the Budget Act"—a rule so difficult to fulfill and so unpopular as to promise if not to achieve parliamentary continence.

The constitution of 1946 stipulated that the Government submitted the budget to the Assembly but that deputies kept the right to initiate expenditure. Yet, article 17 said that "no proposals which would tend to increase expenditures already decided upon or to create new ones (could) be presented during the discussion of the budget and of prospective or supplementary estimates."

In practice, the Assembly voted every year, since 1948, an article in the budget law saying that deputies would not be allowed to propose increased expenditure during the year (*loi des maxima*). A proviso of the standing orders of the Fourth Republic Assemblies made the require-

ment effective. The proviso is now reproduced in the constitution itself (art. 40 of 1958 constitution).

Furthermore, the Government possesses since 1958 another weapon in the field of budgetary legislation. According to art. 47 of the constitution, estimates and budget have to be decided upon by the National Assembly within a period of 40 days after the Government has sent them to its President. If the Assembly does not finish debating the estimates during that period, the Government is entitled to send them nevertheless to the Senate. If the whole procedure is not finished within 70 days of the original presentation to Parliament, the Government is allowed to publish the budget and estimates by decree. This article aims at preventing the procrastinating manœuvres of the Assemblies of the Third and Fourth Republics, which made it impossible for the Government to get the budget voted before well into the new year, and sometimes as late as July, while the financial year begins, in France, on January 1st.

Before 1939 there was no such allocation of time as in England—only simple closure—so that the government was browbeaten and delayed long past even a reasonable period after the beginning of the new financial year. Owing to the fragmentation and conceit of the groups and the synthetic and quaking majority which supported the cabinet, the Minister of Finances was in normal times not able to implement the rules which gave him authority over the estimates of his colleagues. For they could soon break away from his dictates and even from the vote of the cabinet, and actually do battle with him before the Chamber and its Commission of Finances. But a Commission of Finances as it operates in France may enhance the weakness of the Minister of Finances and encourage the deputies to tergiversate. Even in the desperate plight of 1948, the Commission of Finances was at odds with the Schuman government over the deflationary, foreign-devaluation, and gold-market measures deemed essen-

tial to save France's internal and external economy.

Let us consider the organization and functions of the Commission of Finances of the Chamber of Deputies of the inter-war years, and then continue the record to the present. Since 1920 all financial matters have been concentrated in one commission, that of finances. It divides itself into subcommittees corresponding to each ministerial department, and these have special *rapporteurs* under the superintendence of the *rapporteur-général* of the commission. All the estimates come before it, and all the taxation proposals. It advises all the other commissions of the Chamber where their work touches finance. Its connection with the Ministry of Finance is continuous, giving advice and sometimes admonition, and receiving the information it wants. It has an adequate secretariat and general equipment, meets almost every day, and assumes the position of the authority responsible for the finance of the country. In these matters all depends upon the spirit which animates the body. In ordinary times the Commission of Finances is not so much the competitor of the Minister of Finance as it is his master: he can do nothing unless he convinces it.

Now it may happen, and frequently does, that while the party composition of the commission remains constant, that of the cabinet has altered. The commission is in a position to force upon the cabinet its proposals or be its friend. Moreover, the deputies have no reserve in wishing and securing the overturn of a ministry, even for rather personal ends. They are, then, the masters of finance, and the *rapporteur-général* is a very important person, who, if we follow actual experience, appears before the Chamber proud of his budget, determined to support the view of the commission, and dealing freely with policy, and who enters upon those calculations of national wealth and taxable capacity and needs for expenditure which in England are associated only with the Treasury and the cabinet. In 1925 the

commission virtually dismissed M. Loucheur, not content with his taxation proposals, and so dealt with his successor, M. Doumer, that the cabinet staggered, only to fall a few months later.<sup>18</sup> In 1925 and 1926 the commission harbored twelve former ministers! In the experiments of Callaux and Poincaré in 1925 and 1926, the presidents of the commissions of both chambers played a critical and masterful part, even in the remaking of the cabinet. Again in 1932, 1933, and 1935, governments fell because the commission challenged their budgets, while others survived only by making large concessions to the commission's counterproposals. Only very solid cabinets could stand up against the commission. The president and the *rapporteur* of the commission usually find their way into the cabinet in the course of time. Although, then, the commission does most useful work, it encourages the anarchy of the Chamber and takes responsibility from the Minister of Finances without being able to assume it itself.<sup>19</sup> Yet at the root is the chronic evil of party divisions and personal ambition.

The status of the Commission of Finances in the Fourth Republic was identical with that in the Third Republic. The rules were the same and the operation was the same. In the Fifth Republic, although the general status of commissions has been diminished, that of the Commission of Finances remains very high, and the rules and operation are identical with what they were before 1958.

For purpose of audit, France has a court of accounts (*cour des comptes*) composed of independent officials to examine and report upon expenditure, as to both legality and wisdom.<sup>20</sup> The Fourth Republic's constitution (article 18) and the Fifth Republic's constitution (article 47) both give the authority to regulate the accounts to the National Assembly, assisted by the court of accounts. The Assembly charges the court with all the investigations necessary for the purpose. The president and *rapporteur général* of the Commission of Finances and, if necessary, the presidents of the various commissions, may correspond with the court in regard

to any inquiries and studies with which it is charged.

For auditing purposes, Weimar Germany had a court of accounts which was based on article 86 of the constitution and articles 87 to 126 of the Budget Order. It was independent of the government, and took orders from no other authority in the Reich: it was empowered and obliged by the law only; that is, it was in a judicial position. The power of appointment of its president, deputies, directors, and counsellors was vested in the Reich President, with countersignature of the Minister of Finance. They had to have the prescribed qualifications for judgeship or for higher administrative or technical service; at least one third of them had to have judicial qualifications. They had the guarantees of office accorded to judges of the Supreme Court. They reported not only on the legality of expenditure, but on the economy of financial transactions of all kinds and on whether institutions and places had been maintained, or expenses incurred, which could have been retrenched without jeopardy to the administrative object.<sup>21</sup>

*The United States Budget System.* We turn to a system vastly different from the foregoing, because based upon the principle of separation of the legislative and the executive powers—the American budget system.

Before 1921, the United States budgetary arrangements were chaotic:<sup>22</sup> the Treasury stitched together the uncoordi-

<sup>21</sup> Schulze and Wagner, *op. cit.*

<sup>22</sup> For the situation before 1921 see W. F. Willoughby, *The Problem of a National Budget* (Baltimore, 1918). For a separate account of the reform movement cf. G. F. Weber, *Organized Efforts for the Improvement of the Methods of Administration* (New York, 1919); and F. A. Cleveland and A. E. Buck, *The Budget and Responsible Government* (New York, 1920). On the system see W. F. Willoughby, *The National Budget System* (Baltimore, 1927), which contains a good bibliography; A. E. Buck, *The Budget in Governments Today* (New York, 1934); D. T. Selko, *The Federal Financial System* (Brookings, 1940); Report of the President's Committee on Administrative Management, 1936, Chap. III; G. B. <sup>20</sup> Cf. Allix, *op. cit.*

nated, unrevised estimates from the spending agencies, and when these arrived in Congress they were unstitched and divided among the parallel Congressional committees. No concerted balancing of revenue and expenditure occurred administratively or legislatively.

The Budget and Accounting Act of 1921 establishes the following system. It vests in the President the transmission to Congress of the "Budget," which sets forth in summary and detail the estimates of expenditure "necessary in his judgment" for the year, his estimates of receipts, statistical information and balances regarding the finance of past years and the ensuing year, and other informatory data. He recommends action to make good predicted deficiencies and surpluses. In short, there is concentrated in the President the centralized consideration and recommendation of public finance. More, all other executive intervention is excluded by the injunction that no officer or employee of any department shall submit to Congress or its committees estimates, requests, or recommendations regarding appropriations or revenues. This is sometimes overtly, but more often privately, evaded.

To assist the President and to do the preparatory work for him, a special service, the Bureau of the Budget, was created in the Treasury Department, but by the Reorganization Act of 1939 it was transferred to the executive office of the President. Its director and assistant director are appointed by the President, and the bureau operates under rules prescribed by him. This is the workshop of the budget system. However, it has no independent force over the departments but is an investigating and collating authority: in the first place, its authority over the departments resides in and emanates from the President. The President enforces by rules the access of the bureau to the departmental information it wants, and its authority to secure changes. Each department is obliged to appoint a special budget officer who prepares the departmental estimates. The bureau aids and informs Congress as it requests. All, then, on the executive side depends upon the energy and

capacity of the bureau, and very much upon its director, and upon the character of the President. Both together they can approach the British or German system in efficiency: together or apart they can cause the whole system to fall into weakness and contempt. The cohesion does not derive, as it does in the British system, from united responsibility to the Commons and the people: it is much more indirect than that, and hence requires an adventitious, independent probity.

No doubt need now be entertained that this independent morale and determination have been created, especially since 1933. From a handful of staff, its corps had grown to 40 in 1935 and to 600 in 1944. Its director is a member of the Presidential cabinet. Though he is not under the Treasury or legally constrained to work as a subordinate division, the relationship between the two financial departments is extremely close, and the personality of the Director of the Bureau of the Budget may well outtop the Secretary of the Treasury. Since, also, it is very rare that the President decides policy in cabinet session, and since the Director has direct access to him, it is between these two men and sometimes the Secretary of the Treasury that the cardinal financial decisions are made.

The functions of the Bureau of the Budget concern not only the estimates, but also administrative efficiency. Its activities and significance in the latter category are dealt with in another part of this volume. But it can be seen that any responsibility of this kind must allow it to penetrate into the actual management of the other departments, at a stage where the operations which call for funds will be malleable by the bureau. Also, as has already been observed, all bills emanating from the government departments must be cleared with the bureau, so that here again, bills which may involve expenditure or affect revenue may be controlled. Finally, the bureau has direct powers to receive the estimates, and all attendant and supporting information, and to recommend to the President what shall be his answer to the demands.

For this purpose the bureau has a considerable, but still insufficient, number of examiners, some of whom go into the field offices of the various executive agencies and from time to time examine the estimates on the operational spot. The bureau hears the justification of the spending departments and debates with them their claims. It reports to the President, who is very free to change at his own personal discretion the total and the items presented to him. He will take advice from his director of the bureau: but he will also ignore it for a favorite project, or he will return the budget for more economics where the party situation and electoral prospects require it.

By now, the bureau has a firm grip on the administration of the various departments. It knows what is going on, and it is able to measure the demands made upon it, and so to balance the various demands against each other in relationship to each other and then as a whole against the revenue that will have to be raised. On the latter the Treasury naturally has a strong word, sometimes a decisive one, to say, for it is responsible for tax proposals. Furthermore, since the beginning of 1946 it has been necessary to have regard to the recommendations and contentions of the President's Economic Reports which outline the general economic situation and prospects of the nation. (In the British Treasury all these factors—estimates, proposals for taxation and debt management, the general economic situation and reports thereon—are dealt with in combination. A further unifying process occurs through the collective responsibility of the cabinet.) The result is the budget of the United States government for the fiscal year.

Yet all is far from well in spite of the improvements traced so far. It is clear that an inward, cogent articulation of estimates and request for expenditure, the true needs of the departments, their managerial competence in their several departmental domains no less than cooperation of all of them in a grand dynamic march of government, is far from having been achieved. The Hoover Commission reports

leave no doubt that the system just limps along rather distraughtly. As might well have been foreseen, the problem is a far bigger one—no less than that of the problem of the United States chief executive itself; and therefore the matter is intimately related to the discussion in Chapter 26, on the United States Presidency.<sup>23</sup>

The essential difficulty of American financial procedure still remains, in spite of the highly beneficial results of the new system. Congress may do as it likes with the Presidential proposals, for to it, under the constitution, they are little more. The committees and the two Houses may at any stage play ducks-and-drakes with the nicely balanced budget. In fact, the Committee on Appropriations, set up in 1920 with a large number of subcommittees, has adopted the practice of not increasing, though they may decrease, appropriations—and in every year the committee has granted less than the President asked for. The House usually slightly increases the amount reported. The Senate usually increases this slightly, owing perhaps to the large power generally possessed by individual Senators and their log-rolling. The amount is decreased in conference. The net difference between the Presidential suggestions and Congressional grants amounts to about .5 per cent. Thus Congress has subjected itself to considerable self-restraint, the first commandment of parliamentary efficiency.

Grave deficiencies still dog Congressional control over finance. The appropriations subcommittees take hearings on the estimates within their purview. They hardly spend enough time to get a thorough grip of the subject. It should be noted that these hearings are in private, even excluding other members of the parent committee, so that a demand for funds or the line taken by the committee is immune from public challenge.

<sup>23</sup> See Commission on Organization of the Executive Branch of the Government: "General Management of the Executive Branch," February 1949, and Appendix E: "Budgeting and Accounting," and Appendix F, especially this latter; and "Treasury Department."

## LEGISLATION

The members of the subcommittees do not serve long enough to become masters of the departments for which funds are being asked. They report so late in the year to the parent committee that the latter cannot exercise a coordination of the diverse estimates, nor be really master of the suasions of its infants. It is possible for the officials of the departments who are heard by the committees to mystify the committeemen, who may spend an inordinate amount of time on small red herrings that are not even odoriferous. Whole blocks of estimates go through without question at all. And yet, and yet, the officials know that if they are ever caught in some even minor deception they will be very roughly treated by Congress and the public. It must be admitted (I base this on my own observation) that committeemen make many arbitrary cuts in the appropriations—and this must lead to departmental overestimating on the theory that some will be bargained away. Furthermore, the bargains made in conference committee are hidden from the public. It has been proposed that the two Houses shall form one appropriations committee, rather than have a dual and duplicated system as now exists. The crushing duality of the United States system exists nowhere else in democratic government.

Until 1921 the United States audit arrangements were defective. Then the Budget and Accounting Act created a General Accounting office to which were accorded the two things which the old comptrollership of the Treasury lacked: independence of the executive, and power to report not only upon the legality of financial operations but on Congressional mismanagement or inefficiency and to recommend improvements. This arrangement proved to be awkward and obstructive, because (a) Congress gave the Comptroller-General, by statutes, various uniform rules to apply to all departments equally, but (b) more serious, he took his powers to mean not postaudit but obstruction of current expenditures by current audit! This, it will have been

noticed, is vastly different from British postaudit practice.<sup>24</sup>

Under the Reorganization Act of 1945 (section 7) the Comptroller's office was made part of the legislative branch of the government, thus emphasizing the Congressional authority over finance, its expenditure and administrative activity in general. The Bureau of the Budget manages the monthly apportionments of the appropriations to the various spending agencies. The appropriations are normally for the fiscal year and normally unexpended balances lose force with the end of the fiscal period, although there are some—such as those for big construction projects, housing, roads, airplanes, and certain grants-in-aid—which may be carried over to succeeding years until the job is completed.

Above all, there has never been within either House a combined view and authorization of both revenue and expenditure. Each part of the public finances is treated by separate committees which never meet together: no single survey and policy balances revenue and outgo!<sup>25</sup>

The report on Congressional reorganization made drastic recommendations to remedy these extremely grave faults. Among them are: the early Congressional establishment, each session, of annual budget totals beyond which the appropriations may not go unless borrowing is provided to meet excess expenditures; better staffing of the committees; abolition of secret sessions; full consideration by the parent committee of subcommittee reports; and a three-day term during which the committee proposals shall be before the House before consideration.<sup>26</sup> The United States pays heavily for the separation of powers!

In section 138 of the Legislative Reorganization Act, the statute required a "legislative budget." It required the two revenue and appropriation committees of

<sup>24</sup> For American practice see H. C. Mansfield, *The Comptroller General* (New Haven, 1939), and the relevant chapters in C. H. Pritchett, *The T.V.A.* Chapel Hill, 1943).

<sup>25</sup> The Bureau of the Budget attempts to supply unity.

<sup>26</sup> A poor device to secure attention.

## LAWMAKING BY THE EXECUTIVE DEPARTMENTS

each House to meet and report not later than February 15 in each regular session a budget report and consequent resolution containing a determination of anticipated appropriations and revenues for the fiscal years:

If the estimated receipts exceed the estimated expenditures, such report shall contain a recommendation for a reduction in the public debt . . . The report shall be accompanied by a concurrent resolution adopting such a budget, and fixing the maximum amount to be appropriated for expenditure in such year.

Of course, this section assumed that one month was sufficient time to do this properly or to do it at all; that the committee's decision would be able to govern the appropriation committees in their power over their bills; that the required annual debate on the national debt would compel the establishment of a responsible-minded budget. None of these assumptions has been borne out: ways and means—that is, revenue policy—is still almost entirely independent of the amount to be spent, and the quantities of expenditure in the various estimates which make up the total. Party feeling, intraparty disagreements, hostility to the chief executive, headstrong chairmen of the appropriations committees, sincere differences on the merits of administrative spending, genuine alternatives regarding taxation policy and debt reduction between Congress and executive and among the various groups within the parties, have almost entirely nullified the operation of the statute and denied the nation of the benefits it was intended to secure: <sup>27</sup> poise, balance, objective consideration of claims for expenditure, rational relationship between spending and taxing, and harmony between executive and legislature. Failure is admitted.

### LAWMAKING BY THE EXECUTIVE DEPARTMENTS

ALL legislatures have been forced to devolve to the departments the making of

rules and orders and regulations—in other words, a kind of subordinate legislation which has attracted a variety of names: "secondary," or "departmental," or "delegated," or "administrative," or "subordinate" legislation. The volume is immense measured by the number of such instruments,<sup>28</sup> and the political significance is grave judged by the extent of governmental authority so exercised over and on behalf of persons and property.

In Britain in 1890, 168 rules and orders were issued; in 1913, 444; since 1937 never less than nearly 1500 a year, and in 1945, 1706. In the United States, Theodore Roosevelt issued 1011 during his administration; Wilson, 1770; Coolidge, 1428; Hoover, 1424, and Roosevelt, 3711. (See United States Code of Federal Regulation.) The figures for the countries must not be crudely compared!

*The Reasons for Delegation of Power to the Executive* are various as well as inexorable. (1) In almost all countries it is due, first, to the excessive amount of business which falls on the legislature compared with the time available for conducting it. Since a choice has to be made, then one choice is to concentrate attention on the clear definition of the main principles of statutes, and to leave the derivative or incidental rules and orders for formulation by the departments. No legislature could find the time to fulfill this latter function even if it sat twenty-four hours a day, every day, and forever.

---

<sup>28</sup> Until 1946, when the Statutory Instruments Act was passed, the Rules Publication Act of 1893 governed the general procedure for the form of orders and their publication and submission to Parliament. The 1946 statute superseded that of 1893. Among its reforms, which were mainly in the nature of simplification and standardization, it introduced the term "statutory instruments" to cover all orders, rules, and regulations made by ministers under statutory authority. It is a convenient and expressive term which ought to become of general usage. Cf. C. T. Carr, *Concerning Administrative Law* (New York, 1942); C. K. Allen, *Law and Orders* (London, 1947); Report, Committee on Ministers' Powers, 1932; Report, U. S. Attorney-General's Committee on Administrative Procedure (1944); and W. Gellhorn, *Administrative Law, Cases, etc.* (Brooklyn, 1947).

---

<sup>27</sup> Cf. Hearings on Legislative Reorganization Act, 1946, p. 159 ff. for testimony by the secretary and director of the Majority Policy Committee of the Senate.

(2) Many of the problems dealt with by the law are of a complex, technical character; for example, the kind of machines or forms or drugs or animal diseases or safety devices which are to be regulated by law. Legislatures as at present organized are not in a position to master and decide these issues. They need scientific and technological experts to assist them by filling in the law.

(3) The rapidity with which new situations arise—for example, some new device in the coal mines, or some action by a foreign country regarding its economic policy, or some new unfair business practice—requires a certain administrative flexibility or discretion.

(4) (This applies more particularly to the United States), some fields of regulation are too unclear in their legislative demands for Congress to be itself sure of what to do in each case, and yet they are too important in Congress' estimation to be delivered over altogether to the executive. Hence a kind of experimental and developmental submission to commissions like the Federal Trade Commission, the Interstate Commerce Commission, and so on.

*England.* In England, since there is the closest correspondence between executive and legislature, administrative rules and orders are, in important cases, valid only after the legislature has signified its consent. As prescribed in the parent statute, some (about 3 or 4 per cent of those examined) are sent to Parliament for an affirmative resolution;<sup>29</sup> others are submitted and made subject to a nullifying prayer against them within a certain number of days; others are submissible but call for no proceedings by Parliament; others, again, do not have to be submitted. The regular time for lying before the House is forty sitting days. The requirement of submission to the legislature sharply distinguishes the control of subordinate legislation in England from that in the United States, France, and Weimar Germany. The power to make such orders

is wide in scope and can be fearful in compulsion, for though some of the orders are hardly more than mere forms for records, censuses, or statistical information, others govern the procedure for the enforcement of statutes which limit personal liberty or control property, or give benefits to some while withholding them from others (as in the demolition of slum property, the right to search, the denial of licenses to conduct business operations, and so on). The more comprehensive and pervasive the planning of human activities through government, the more massive this power must come to be. It has raised the weightiest criticism and stimulated ideas for controls.<sup>30</sup>

Hardly any member of Parliament is individually equipped to challenge such rules and orders; and the House, as a body, is even less equipped or ready to review them. Unless any special interest, economic or otherwise, is spectacularly affected, no challenge is voiced. But the opportunity is open—and sometimes good advantage is taken of it. The rules and orders are made by the departments, sometimes after compulsory consultation of advisory representative bodies; some may pass through parliamentary twilight, and be subjected to a real public scrutiny only when they cause expensive litigation, because they happen to be *ultra vires*. Even, then, their political reasonableness, as affecting public liberty and utility, may be judged by no tribunal. (The House of Lords in 1924 led the way when it established an improvement in the procedure respecting rules and orders: no motion for an affirmative resolution of the House in connection with orders may come before the House for discussion until it has been discussed and reported upon by the Special Orders Committee, appointed annually.) Public petitions are entertained when the order is of a private-

bill nature; where it is of a public-bill nature, a special inquiry may be recommended on grounds of policy, principle, or precedent.

Rules and orders are bound to increase with the evolution of the social policies of our time. It is equally certain that the lawmaking body is ill-organized for their control, while the ordinary courts of law are irritated and often incapable of properly measuring administrative necessity and justification by the standards they properly use in general. As the Committee on Ministers' Powers observed:

The facilities afforded to Parliament to scrutinize and control the exercise of powers delegated to Ministers are inadequate; there is a danger that the servant may be transformed into the master.

The increase of subordinate or delegated legislation during World War II, and the clear probability that governmental activity would increase when it was over, caused the House of Commons and publicists to turn to the subject again and again. Then, following a debate on May 17, 1944, the House established a Select Committee on Statutory Rules and Orders

to consider every statutory rule or order upon which proceedings may be taken in either House (subject to affirmation or annulment) and draw the attention of the House to provisions which (i) impose a charge on the public revenues, (ii) are made under an enactment which excludes challenge in the law courts, (iii) appear to make some unusual or unexpected use of the powers conferred by the statute, (iv) have been withheld from publication by unjustifiable delay, (v) call for elucidation of their form or support.

It will be observed that the terms of reference do not include any power over the "merits" or "policy" of an order or rule. This is because the instrument is supposed to be only the closer effectuation of the "merits" or "policy" of the statute, already settled by vote of Parliament. Yet politicians are still uneasy about the process, because the instruments could add to or vary the will of Parliament as stated in the statute (and in some cases perhaps they have).

The committee has an immense task: in 1943-44, of 1483 rules and orders it scrutinized 291; in 1944-45, 168; in 1945-46, 469; in 1946-47 of nearly 1900 rules and orders it examined 795 and drew the attention of the House to 6. It has the regular official assistance of the counsel to the speaker of the House of Commons, whose expert knowledge is made available in the form of memoranda and oral advice, without which the task of sifting would probably be impossible. The committee calls civil servants to explain matters it does not understand. It reports to the House whether there is or is not reason for drawing the special attention of the House to the rules and orders, which it deals with in batches within the time limits for action. Members of the committee are not bound to follow the report of the committee: it is still open to them, as to any member, to challenge an order where the statute has so permitted.

There is no doubt, judging by the committee's reports and by the recent challenges of rules and orders, that some members of the House are much more zealous than ever before in watching the stream of rules and orders. Further, the committee makes special reports regarding the procedure on rules and orders: on their drafting, and again, on the need for a more rational determination of what kind should be the subject of an affirmative resolution of the House and what merely subject to nullifying prayer. As time goes on, the committee must assist the establishment of more rational procedures and create a corpus of knowledge enabling better control.

The House has not the time for an adequate consideration of the committee's reports, nor have members sufficient time available for their own challenges: for only a half-hour at the end of the day's business is provided. Not two days in a session have been spent on an affirmation or prayers against. Various proposals for improvement have been offered. The chief one is the addition to the committee's powers of considering the "efficiency" of the rules and orders as a means of carrying out the purposes named in the rele-

vant statute.<sup>31</sup> This proposal has been rebutted by those who are afraid of the committee's powers thus to "invade Whitehall"—that is, to intervene in the day-by-day administration of the departments.<sup>32</sup> Others have claimed that the committee should have power to raise matters of "policy." This proposal has been even more robustly gainsaid as trenching on the authority of Parliament, as a waste of time by going back over the ground already trodden by Parliament, and as challenging the authority of the government.<sup>33</sup> Some have even proposed that "particular" interests who feel aggrieved by any instrument should have the power to apply to the committee for redress: <sup>34</sup> this has been denied on the ground that it would leave the committee and thus the government open to hundreds—perhaps thousands—of challenges, and make laws unworkable. An instance given was a law relating to traffic offenses: other statutes would be as fruitful of complaints.<sup>35</sup>

So important is the subject that a thorough inquiry is promised. The most thoughtful expert's opinion is likely to be the shape of policy to come: <sup>36</sup>

With regard to the present proposal to extend those heads (the objects of the committee's supervision) to include policy and merits, it raises such important administrative considerations that the Government might feel obliged to prepare itself to resist challenge on party lines and the present impartial [*sic*] scrutiny would change its character. It would be necessary to hear witnesses competent to explain and defend decisions at the policy-determining level. . . .

There are indications that delegation of legislative power may have to be developed still further rather than to be fettered by a new type of supervision.

*The United States.* If the problem of subordinate or delegated legislation is also serious in the American constitutional system, its solution is so far very different from the British solution, for control by the courts, not the legislature, is relied on. From the beginning of the Republic, Congress found it necessary, when it had set down the principle or standard in the statute, to delegate to the executive, by statute, the power to frame rules and regulations. It is necessary to distinguish two species of such rules: (1) executive orders made by the President, emanating from his general constitutional responsibility to see that the laws are faithfully executed, whether the power has been explicitly conferred upon him by a statute or not; and (2) all others, emanating from the powers—given by statute to him and to the heads of departments and agencies—to make rules and regulations.

To the foreign observer it is at first sight astonishing that none of these rules comes before Congress for review and for annulment or positive acceptance. With the exception of an article of the Reorganization Act of 1938—which permits the President to make orders for better departmentalization of the administrative branch that become valid if not vetoed after a period by Congress—all other orders, rules, and regulations are challengeable only in the courts. The grounds for such challenge may be that they are outside the statute; or that they are made without due regard to the procedure provided in their mother statute; or that they are unconstitutional because the statute is unconstitutional or because they themselves infringe the constitutional guarantees. This kind of control, as we have already seen, is extremely penetrating. But it is not a control of policy, even so much as British practice has tried and been able to secure.

It is a matter for surprise that the report of the Attorney General's Committee on Administrative Procedure recommends against any submission of administrative

## LAWMAKING BY THE EXECUTIVE DEPARTMENTS

orders to Congress.<sup>87</sup> Its main reason is that the method has not been successful elsewhere. But this is hardly true and it would seem to be shortsighted: for the success of Commons' control does not lie only in the number of rules and orders challenged and reversed, but in the effect on the action of ministers and officials induced by the anticipation that they may be challenged. Perhaps, however, the reason for rejection of Congressional control is that Congress may easily be an opponent of the executive, even when both are of the same party, and that Congressional procedure is already hideously cluttered up and confused. In view of these circumstances and the power of the special interests in the lobby, and in view of the fact that sometimes the two branches of the government are of different political parties, legislation would *never* get administered if the rules had to be submitted for the approval of Congress. The litigious and partisan temper would frustrate the administrative fulfillment of laws. Nor can it be omitted that the making of rules and orders is "executive" or "administrative" power, and that by the constitution this is the preserve of the President. Submission to Congress would raise difficult constitutional questions, just as, in reverse, such difficulties arise when Congress delegates what the Supreme Court defines as "legislation." But it is possible constitutionally, surely, for Congress to give itself the power of review over statutory rules and orders?

The clearly distinctive answer given by United States government to the problem of administrative legislation is the institution of commissions like the Interstate Commerce Commission, the Federal Communications Commission, the Federal Power Commission, and the Securities and Exchange Commission. These have variously been called "quasi-legislative," or "quasi-administrative," or "quasi-judicial," to indicate the mixed character of their functions. For Congress has entrusted them with the administration of laws like those regulating the railroads, radio broadcast-

ing, unfair business practices, interstate power utilities, and stock-exchange transactions. Congress was unwilling to vest the enforcement of these laws in the ordinary administrative departments, which it could have done as in other countries. But it believed a special procedure ought to be established for such acts as making orders to cease and desist from certain business or corporation practices, for putting into force certain railway freight and passenger rates, for improving railroad service, for issuing licenses and certificates of public convenience and necessity to operators of radio stations, and so on. Moreover, Congress thought the commissions should be multimembered, and not have only a single top policy director like the secretary at the head of an ordinary administrative department, and that such commissions should not be the preserve of one political party.

*Weimar Germany.* The phenomenon of "skeleton" laws, carried out by "administrative" legislation is witnessed also in European government: indeed, it preceded development in England and the United States. A much wider power to make rules was always recognized there as inherent in the executive, a product of centuries of autocracy; but the power is becoming less and less recognized as existing apart from empowering statutes or constitutional clauses. In Weimar Germany the cabinet was obliged to pass so-called *Rahmengesetze* (framework laws), while obtaining the power therein to fill out the law by executive regulations. Most of the *Verordnung* or *Verfügung* (rules) had to be first placed before various officially appointed representative consultative bodies in each department before they were valid. In some cases the assent of a parliamentary commission was required for their validity; in others, submission to the *Reichstag* for approval or challenge. As in England and the United States, the rules were challengeable before the ordinary courts, and in addition before certain "administrative" courts, for inconsistency with the statute (they had to be *intra leges*, or as the phrase would run in English and American practice, not

<sup>87</sup> Report, U. S. Attorney General's Committee on Administrative Procedure (1944), p. 120 ff.

*ultra vires*), and for their obedience to the processes for their creation provided in the statute.<sup>38</sup>

*France.* In France two types of rules prevail: *règlements* (simple rules), and *règlements d'administration publique* (rules of public administration). Their number has grown for much the same reasons as in other modern states.<sup>39</sup> Both are subject to actions for annulment by direct action before the *Conseil d'État*, or indirectly before the ordinary courts, when their validity is incidental to some case in which they are involved. In the Third Republic the power to make simple rules was deemed to have been given to the President of the Republic in article 3 of the constitutional law of February 25, 1875: "The President assures and superintends the execution of the laws." The power is now, by article 47 of the constitution of 1946, attributed to the premier—the president of the Council of Ministers. It is a change with some significance. The rule-making power was, under the Third Republic, amply used when emergency laws, especially on financial matters, were passed to deal with the oft-recurring crises. They were unavoidable instruments of governments which were themselves unstable and faced with distracted and incoherent parliaments. Rules of public administration are made on the basis of specific statutes, by the cabinet. As already observed, the *Conseil d'État* must be consulted in their drafting.

#### LEGISLATIVE CONTROL OVER THE EXECUTIVE

We have observed that parliamentary bodies were not exclusively engaged in

legislation but that their functions were mixed. Historical evolution has deposited with them what we broadly call the "control of the executive." This control is often referred to in English political discussion as being quite as important as (and some assert more important than) legislation, and as making Parliament the "grand inquest of the nation." Broadly, this means that the legislature is to keep the executive and the civil service within lines of policy which it supports.

Considerable imagination must be exerted to realize how significant to the welfare of the nation the control of the executive is. All modern states have assumed an immense range of governmental control, regulation over the multifarious activities of their many millions of citizens. In some cases they have proceeded to the actual conduct of widespread, strategically placed, economic enterprise: as the government credit, financing, farm and housing activities in the United States; the same in England with the addition of nationalization of the coal, transport, electricity, gas industries, the medical profession, and the Bank of England; and the same in France, with the addition of nationalization of coal, transport, banking, and so on. In all these instances there must be added the conduct of the social services and the provision of social security. The governments have thus assumed the responsibility for vast monopolies. They have no competitors. Their operators are the civil servants, who now, at headquarters and in the field, number millions. These are the managers of over forty per cent of the nation's income in Britain and over twenty five per cent in the United States. They are organized in complex ways in complex departments to conduct complicated operations to secure lawful ends which are themselves necessarily complicated. Their activities are sometimes merely routine, as when a postal carrier collects his letters and delivers them on his appointed route. But they are also crucial, standing at points in the social process where a single order controls the rights and activities of millions of men and women.

<sup>38</sup> Cf. Schlegelberger, *Rationalisierung der Gesetzgebung* (Berlin, 1928); and K. Dessauer, *Recht, Richtertum und Ministerialbürokratie* (Berlin, 1928), p. 93 ff. E. Jacobi, in *Handbuch des deutschen Staatsrechts* (Tübingen, 1930), Vol. II, p. 236 ff.; F. Fleiner, *Institutionen des deutschen Verwaltungsrechts* (Tübingen, 1928), p. 70 ff.

## LEGISLATIVE CONTROL OVER THE EXECUTIVE

The problem of the control of the everyday activity of government is the cardinal problem of contemporary government.

Now, before we enter into a discussion of the extent to which legislatures do now control the executive, the meaning of the word "control" needs definition. We do not mean that legislatures have, or pretend to have, or ought to have, the power of continuous intervention in administration and positive participation in the execution of the law. They do not, in fact, do more than act as the judge and the corrector of the cabinet and its administrative assistants. We could show, further, that it is almost impossible to do more than this (take, as an example, their financial powers!), and that where they confine themselves to this alone, the result of joint work of legislature and the executive is better than where the legislature attempts to interfere more positively.<sup>40</sup> We must, therefore, observe in what countries legislatures attempt to do more than control, and consider the lessons of that experience. One other point. It is not always necessary for legislatures or any controlling body to intervene. Their mere presence is sufficient to establish a standard of behavior for ministers and all public career servants. Marx declared that a specter was haunting Europe: in administrative control it must be contrived that a specter, the legislature, shall incessantly haunt executive officials! We must give due credit to the influence of the simple presence of the legislature, to the "silent rhetoric of a look." However, this is not all; nor is it enough.

*Debates and Inquiries.* Control of the executive has the longest history in England and very great importance is attached to it, some holding that Parliament's chief duty is still what it was before the enthusiasm for statute making began after 1832. Upon examination of the opportunities and machinery for control, we find that the House of Commons is reasonably but not fully effective. Let us con-

sider the occasions when the House may inquire into the conduct of administration.

The first occasion is the debate on the king's speech to Parliament (the equivalent of the Continental "ministerial declaration"), which occupies something like 5 or 6 days. Then a little over 32 days altogether are devoted to the discussion of the estimates and other financial matters. Here, as we have pointed out, the discussion is not so much on the economy of the estimates but is rather a general examination of the administration of the department demanding supplies. And finally, we may count about 14 days a session (at the utmost) when the motion to adjourn the House upon a matter of public importance is accepted by the speaker<sup>41</sup> and a subject of administration debated, or when the government itself gives time for the discussion of substantive motions on important matters disturbing the public mind, sometimes called "votes of censure." Next, we may count 6 days debate on the Christmas, Easter, and Whitsun adjournments. Altogether, then, there are available nearly 60 days in each year when the House concentrates upon the subject of administration: this is 40 per cent of the time of the House.

It is impossible to state quantitatively how much time is devoted in such debates to general policy and how much to administrative detail. The two elements are blended, and the proportion of each varies from case to case. It can be fairly asserted that no item of administrative mismanagement can be regarded as immune from pursuit by the House of Commons. It is recognized that what may seem to be a detail—e.g., a veteran's pension not paid on time, or a late announcement of a rise in the price of cocoa—may involve a profound issue of public policy, general administrative weakness, or personal incompetence. No government can possibly resist the House of Commons' sense that something is rotten in the state, or fail, then, to offer the time for debate re-

<sup>40</sup> Cf. J. S. Mill, *Representative Government*, Chap. V.

<sup>41</sup> Cf. Sir Gilbert Campion, *Memorandum and Evidence in Third Report, Select Committee on Procedure*, 1946.

quested by the opposition (the leader of which is paid to conduct the opposition more efficiently). A special investigation may follow by a select committee of the House—as in the case of the disclosure of budget secrets, or the leakage of information from a government department—or a special tribunal of inquiry may be set up to make the attendant investigation. The power of the House of Commons may be regarded as peremptory over the administration: ministers bow to it, the opposition insists on it, the minority in the ranks of the government maneuver with it, and officials both dread and respond to its formidable strokes.

These controls over the administration occur in the full session of the House of Commons, not in the twilight of committees. All the members of the House participate in a chamber which is the single focus of the inquest. (The House of Lords has a parallel power of inquest.)

In addition to the regular order of inquest as embodied in the debate on the king's speech and on the financial legislation, and in addition to the special occasions of motions put by the opposition on more particular and critical occasions, there is another regular form of parliamentary control of the executive—continuous, everyday, always threatening and always occurring. This is Question Time.

*Questions: Rules and Numbers.*<sup>42</sup> All members of the House of Commons have the right to ask questions of ministers every day of the week except Friday. As the House sits Monday through Friday, this means that questions are in order on four days of the week. This is regular procedure all the year round when the House is in session. There are about one hundred and twenty days on which questions are asked each year. This is the field of operations.

It should be noticed that questions happen on consecutive days, and regularly,

with the week-end interval. The executive is under continual surveillance; the House is under continual obligation to think and interrogate. It is good for both. Question time lasts from shortly before 3 P.M. each day to 3:45 P.M. with a small margin—this is slightly less than an hour.

Each member has the right to ask as many as three questions for oral answer; he may ask as many questions as he wishes for written answer. The limitation on the oral questions is in the interests of fairness to all members, to thwart monopolists. Oral questions are "starred," written ones "unstarred"—an indication to the clerk of the House, which sort is intended. The answers to be "written" are published, like the oral ones, in the Parliamentary *Debates*.

A clear twenty-four hour notice must be given to the clerks of the House of oral or written questions to be asked. Since this means its appearance on the notice paper, questions may be answered from between twenty-four to forty-eight hours after handing in. The speaker or the minister may also be approached privately, by "private notice" by the member. This gives the opportunity of raising very important questions and skipping the time limit of notice. It is employed usually by a member of His Majesty's Opposition, or otherwise especially influential members of the House, with due sense of responsibility. It is an important safety valve for matters of urgency.

An average of seventy to a hundred oral questions are asked every day; as many more are written. The asking member, and any members of the House, may at once ask supplementary questions on matters arising out of the answer just given. It is a free-for-all, though the original questioner is considered by the House to have priority. It is clear that the more "supplementaries" are asked, the less time will be available for the original questions remaining on the list. Therefore the sense of the House keeps in check the supplementaries—readers of the Parliamentary *Debates* will notice that about three supplementaries are allowed. They are kept in a pretty terse form—for if they

<sup>42</sup> This account reproduces part of my paper for the Joint Committee on Reorganization of Congress, *Suggestions for Strengthening Congress* (June, 1946), p. 49 ff. Cf. also T. Erskine May, *Parliamentary Practices* (London, 1946), p. 381 ff.

## LEGISLATIVE CONTROL OVER THE EXECUTIVE

were longer, they would be ignored, and the questioner would become very unpopular.

The purpose of the supplementaries is simple. For the original question, the minister is prepared with an answer, which has been formulated for him in the first place by his department but in which he has probably taken some part. But it is the purpose of the supplementary either to get additional information which has not been given, or, what is usually more likely, to pierce underneath the minister's guard and get him to divulge any state of affairs which he would otherwise not confess.

It is an excellent short probe. An intense passage-at-arms may occur. Official shortcomings may be revealed, and inferred from matching the supplementaries with the original answer. Smart official advisers attempt to anticipate the supplementaries. They sometimes succeed. More often they cannot. The strain on the ministers' readiness of mind, and parliamentary improvisation, and the stimulus to the hunting instincts of the members of the House, tones them all up. The supplementary may be very revealing. In civil life the maxim "Least said, soonest mended" is advised; in supplementary questions the maxim is, "Most said, Minister ended!"

No formal debate follows the questions, but a short, sharp debate, lasting from seconds to one minute, may burst out on any matter of importance. It may lead later in the session to a debate if members smell a rat.

The pressure on oral questions is very great, and in fact it is difficult to get more than about seventy answered per day. Those which are not answered orally are answered in writing. It has been recently suggested that an additional quarter-hour be allowed for questions; there seems to be a sentiment favorable toward the proposal, but it has not yet come under formal consideration.

Supplementaries are informally curtailed by the sense of the House, the tactics of the answering minister, the desire to get on to the next question—and

formally, when the speaker decides that the business of the House is being retarded.

Though questions may be asked by anybody, in fact some fifty or sixty leading members of the House manage to get most in. This is natural selection, and nothing sinister. Also, the opposition puts more than half the questions, most of them by the leaders of the opposition, which may one day itself be in office and under questioning. But the rank and file of the government benches, that is, of the majority, are also busy questioners of the government, that is, of their own leaders.

The practice of the House, as interpreted by the speaker, requires that the questions be genuinely designed to elicit information. They always do; but that may not be their intention, and this is discussed in a moment.

There is another rule of greater importance. Questions can be addressed to ministers only where the subject matter is definitely a minister's responsibility. Thus, matters altogether outside the cognizance of government cannot arise. Also, the questioner must be very careful that he addresses the question to the right minister, otherwise the wrong one will address it finally to the right one, but the opportunity of oral answer may be lost owing to the delay. The officers of the House attempt to avert such misunderstandings. Where questions are on the more general responsibilities of the government—that is, on general past or future policy—the prime minister will answer.

Questions are sometimes "planted"—that is, are asked by a member in arrangement with the minister in order to give the latter the opportunity of making a statement on a subject which he deems ought to be imparted to the House. Again, there is nothing sinister about this. It is a part of useful relations between executive and House.

In order to avoid overpowering strain on ministers, who have their administrative and cabinet business to attend to, and in order to give members of the House the chance of directly interrogating ministers

and not their understudies, the House has accepted a rota of days: for example, questions on agriculture and fisheries and commerce will come principally on one day, and those on foreign affairs, health, education, and so forth, on another day. But the questions are not all specialized to these days. Each day has a mixed bag.

*Force of Questions.* Every conceivable aspect of British government, from a minute problem in social services administration to the whole policy of the government—from little Pedlington to the course of foreign and imperial policy—may be the subject of questions. Starting no bigger than a man's hand, any question may develop into a crackling, intense storm, with thunder and lightning, and may even lead beyond the question hour into a full debate on government policy on a later day. There is a contingent, tense relationship, a kind of menace underneath the purring, which is exciting for the lions, for the gladiators, and for the public. There is real mental strife.

Questions are asked in full assembly of the House, not in the recesses of committee rooms. The House, often not fully attended, is most fully attended every day at question hour. Here is something dramatic and something that gives communion. Here is a focus for the grand inquest of the nation.

The first ostensible purpose of question time is to obtain information. If it is oral or written, it is fresh and addressed to a specific point. Other government publicity in printed form is very full but may not answer the daily questions in a man's mind. But the peculiar function of getting information by questions is not to reveal the mere facts about government activity, but to throw light on the condition of government in daily action and in daily preparation for tomorrow's action. It therefore has a contemporary and anticipatory quality. Members are trying to see what is over on the other side of the hill—and to do so early enough to influence the government before its commitment is absolute.

The ulterior purpose of the questions is far more important. Question hour is

part of the apparatus of the House for controlling the executive, and for participating in the executive's course of action. It is the disciplinary quality of questions which is their characteristic and most significant mark. Members are trying to probe into the activities of the minister and the cabinet as a whole, and, behind these, the vast rabbit-warren of nearly a million administrators engaged in multifarious activities.

The minister is responsible for the administration of his department—the department is kept up to the mark by pressure brought to bear upon him by the House of Commons, and the pressure is continuously exerted through questions. Questions are formulated in a way as to suggest blame—that all is not well in this branch of public affairs, that there are weaknesses to answer for, not merely facts to give.

The minister is not simply giving information; he is answering an insinuated charge. He can answer this charge satisfactorily only by having his administrative department as perfect as man can make it. It is for him to vent his feelings on his departmental advisers if he is tripped up in the course of questions. His ministerial reputation with his party, with his cabinet colleagues, with his constituency, will depend on the showing he makes at question time. He is on incessant trial for the future of his own career—he is under cross-examination by any of six hundred members who believe that they could do the job better than he can. It is a serious ordeal. Moreover, it is a continuous one. He might get by with an evasion on Monday, but he is in the ring again on Tuesday. He may be witty and escape in a gust of laughter on Wednesday, but the questioner may trip him on Thursday. He cannot escape all his questions all the time. Often members will "gang up" on him with integrated questions, so that he cannot escape a barrage.

*Effect of Questions.* The effect on ministers, as all have admitted, is compelling. The effect is equally dynamic on the public employees who work behind the ministers, especially as the close official advisers

attend the House of Commons in an official "box" behind the speaker's chair outside the bar, but close enough to advise a flummoxed minister at his whispered entreaty. There is an almost instantaneous transmission of the galvanic feeling of the House, through the minister, through his on-the-spot advisers to the thousands of civil servants who execute his policy. Woe to those who have failed him!

Questions put day by day for daily answering prevent administrative trouble or inefficiency from piling up to a point where it assumes scandalous proportions. The many minor operations make major surgery unnecessary. The minister knows the mind of the Commons, and can sense what the Commons will or will not tolerate. If he does not, he will be a parliamentary failure. The fact that he knows how far he can go is a great assistance to him in the assurance with which he can run his department. It seems to be a very worrying process, and it is; but it has the consoling effect that responsibility is then shared by the House of Commons. Hence, it is not necessary to put off criticisms of administration until they reach proportions where only a smashing sensational and disturbing investigation is necessary to set things right.

Questions have an important bearing upon the coordination of the administration's total activity. Any evidence that the departments overlap or that they stultify each other by want of cooperation or organizational inefficiency is immediately taken up, and the attention of ministers called thereto. (This benefit was not appraised in the section on administrative coordination of the report of the President's Committee on Administrative Management.<sup>43</sup>)

Many questions are not even put in the form of asking for information, but in the form of "Is the Minister aware . . .?" followed by information given by the questioner. This is nothing but a deliberate drawing of the Minister's attention in public to some governmental matter which

should be put right. It may be an administrative grievance relating to a pension that has not been promptly enough settled at the member of parliament's direct request to the minister. Or perhaps it may be something which concerns civil rights, as in the Savidge case; or intervention in the Spanish war; or the badgering of Mr. Churchill about his policy in Greece; or the Secretary of War's threats to Mr. Duncan Sandys, M.P.; or unemployed-assistance regulations. Thus, in the first case, the use of strong-arm methods by Scotland Yard policy; in the second, a continual barrage of questions about Franco; in the third, questions which caused Mr. Churchill to change his policy; in the fourth, the allegation that the government was threatening prosecution of a member to prevent disclosures of their ineffectiveness in providing anti-aircraft guns; and in the fifth, discussion relating to riots because the unemployment-compensation regulations had taken no heed of the effect in various localities.

The temper of the House is made manifest to the government. The sentiment of the House becomes part and parcel of the government's policy.

Why then does the Government take notice? Why can it be jolted? That is the crucial issue, of supreme relevance to American circumstances. The answer is that there is a seamless web between government and the House of Commons. Members of the government are members of the House: elected in the same way, entitled to the same privileges, subject to the same obligations, living while it lives, losing office when it is dissolved. Without a fixed term like the President of the United States or of any cabinet member he likes to keep in office, the position of ministers is dependent on the credit they have with the Commons and the country, as demonstrated in office under cross-examination. They hold office because they are leading members of their party; they will lose it if they fall out of harmony with fellow party members to whom they have obligations. Their position is not fixed or absolute; it is contingent on their showing a daily level of quality. The opposition's

<sup>43</sup> Cf. Chap. 26 below.

only chance of ever getting into office is to overthrow the government at a future election, discrediting them to the country. Questions may contribute to this.

No bar separates members from ministers. All are members of one body. The House has authority over everything, not merely legislation; it is master of the executive also. The cabinet are men who owe all their credit and strength to acceptance by the House of Commons after long apprenticeship as members who themselves used to ask questions and thereby show their quality. This is the supreme postulate: the impossibility of making a dividing line between legislature and executive in the British constitution.

It will, therefore, be appreciated that questions derive especial value from the fact they are conducted in the full assembly of the House, in the full light of the national day. This is supplemented by the fact that many of the ministers, and often the prime minister, are in the House at question time, all together, one solid block, facing the House, infiltrated by the House.

Further, all acute questions get full reporting in the press (and not merely the major metropolitan press.) This opportunity to be noticed by the public is a stimulus to members to ask searching questions.

Ministers must answer questions, and in the end must answer them candidly. There are saving rules for the "public interest," and for the sake of not prejudicing pending negotiations, and for the internal administration of the nationalized industries and services. In wartime the Speaker is especially cautious to refuse questions which may help the enemy. The House allows latitude for withholding information, but the latitude is given in its judgment. A minister, or all ministers together, refusing to answer would find themselves voted out of office by a vote of no confidence. This is an essential factor in the situation—the House is master of the government; it cannot refuse frankly to answer proper questions, and what is proper is what the House says is proper.

A question's power over a minister in England is equally a power over the whole cabinet including the prime minister. Ministers take account of that collective responsibility in their answers; each commits all, and all, therefore, remember each. On the cardinal question of main direction, the prime minister himself will answer.

Proposals to limit the number of questions to two per member were rejected so as to leave freedom to members who had enough ideas to ask three. A suggestion to increase the time allowed for questions was not accepted, because it would trench on other business of the House, as well as impose further hardship on ministers and civil service. The time of notice has, on recommendation by officials of the Commons and the government, been extended from one to two days, on the ground that answers can often be soundly prepared only after extended fact-finding by cable, telegram, consultation, or research, and where policy is concerned, after much forethought. It was deemed better to lengthen the notice than to force the minister to give a superficial answer or ask for deferment. The disadvantage involved in the lengthening of notice, that often the question will not be answered in the same week, was regarded as less important than the advantage to the House of being able to get a well-founded answer, and then a fair deal from the administration. There is always the private-notice question to cope with matters of urgency.

What importance the Select Committee on Procedure attributed to questions may be gathered from its observation: "They regard the right to put Questions to Ministers as one of the most important possessed by Members. The exercise of this right is perhaps the readiest and most effective method of parliamentary control over the action of the executive."<sup>44</sup> So powerful is the influence of the questions on ministers and civil servants that ministers have sought to safeguard the daily

<sup>44</sup> Second Report, p. iii; the evidence in this report (January, 1946) constitutes a most valuable commentary on the practical operation of questions.

conduct of the nationalized services—the Bank of England, the coal industry, transport, electricity and gas, the public medical service, broadcasting, and so on—from close questioning in the House. It is feared that their employees would be so frightened of making mistakes that they would cease to be enterprising.<sup>45</sup> Here, is an issue with a history of controversy.<sup>46</sup> No government can commit the House to limit its questions, for the Speaker is master of the limits to questions, but there is no doubt that the Speaker would be guided by the sense of the House as led by the leaders of the majority.<sup>47</sup> It is my opinion that such important sectors of the national life will finally have to yield in very large measure to the questioning of the House.

*Interpellations.* The right of interpellation in France was not given by the 1946 constitution, but it was deemed to be an immediate and fundamental implication of the principle of ministerial responsibility. From the Revolution of 1789 the tradition and practice of a particularly strict accountability of ministers has developed and gives force to the principle. It is an important minority right, and a bludgeon wielded over the head of ministers. The interpellation is a kind of question, long and rather querulous, of the nature of an English vote of "no confidence," not like an English question. Its purpose is to put the government to the trouble of explaining its objects and methods in the particular branch of its policy and administration which is attacked.<sup>48</sup>

Any deputy could notify the president of the Assembly of his desire to make an interpellation, submitting a summary of

it. It could be of the greatest width. The president next day informed the government and the Assembly. On the Tuesday afterwards the conference of presidents which settled the order of business fixed the time for the interpellation by agreement with the government and the interpellator. The Assembly could itself fix the day if fifty members endorse the interpellator's request; this was done without debate on the motion, and after hearing the government. Additional interpellations could be added to the original one, but not after the lapse of three sittings from the fixing of the timetable, and never (as used to be possible) during the interpellation itself. The government had to be informed of these suggested additions and had the right to speak on them: the Assembly then decided whether they were to be admitted. This right of addition of interpellations was one of the most famous ways of embarrassing a government, for often, if it were seen that the government was in difficulties, additional troubles would be made for it in the mounting excitement of the chase. After the interpellator had started the discussion, it was open to any deputy to take part. On the *ordre du jour* of the day which wound up the discussion, one interpellator, the group presidents, the government, and the presidents of commissions could speak. Any deputy who wished could have five minutes in which to explain his vote. In the heyday of its power it was the government which settled whether it was to be interpellated and when; in the days of its weakening the government was obliged to accept interpellations which hastened its downfall.

Broadly, then, the ministers were subject to attack from many directions; in 1935 M. Laval was faced with some seventy interpellations of an exceedingly mixed character as the Chamber opened its autumn proceedings. It is to be expected, considering the nature of French deputies, that the government would be severely harassed by interpellations. The expectation was, indeed, overfulfilled in

<sup>45</sup> Cf. Debates, June 7, 1948, cols. 1649 ff.

<sup>48</sup> *Règlement*, Chap. XV, for the 4th Republic.

the Third Republic.<sup>49</sup> The regular day for interpellations was in 1900 fixed on the Friday of each week and led to the presentation and adoption of the *ordre du jour*; <sup>50</sup> that is, there were some forty debates a year on interpellations alone. It will be noticed from the last few sentences that the deputies tried to find another way of making themselves heard—by debating the date of the interpellation. This practice was limited by new rules: only minister and interpellator might speak; the latter had only five minutes, and could raise the matter only at the end of the sitting.

The interpellation was terminable in one of three ways—without any vote at all, when the incident is simply closed; or by a vote upon the *ordre du jour pur et simple* or by the *ordre du jour motivé* (motivated order of the day). The first-mentioned is hardly more than a question. The second is a resolution expressing no opinion on the merits or demerits of the government's case; it is a reservation of opinion, and the Assembly proceeds casually to the next business. But a ministry may have learned by the tone of debate, and from abstentions in the voting, that it is disliked, and many resigned because they were damned with praise too faint. The *ordre du jour motivé* is a definite vote of confidence in the government or a definite withdrawal of confidence. Thus: "The Chamber, considering the assurances of the Government, is of the opinion that the consequences to the mining industry have (or have not) been and will (or not) continue to be disastrous, passes to the Order of the Day." The negative is virtually an overthrow of the cabinet.

Now it was possible for interpellations to be joined, and frequently they were,

with the result that the diverse passions of the Chamber were joined and focused, culminating in a vote of censure on the government. This was a common way of defeating a government, and about three fifths of French ministries have thus fallen.

What, then, is the significance of the interpellation as a means of control of the executive? *First*, we must remember that it is not only the nature of the interpellation which destroys ministries, but the nature of the party system and the deputies' peculiar temperament and views of parliamentary rights. These are the root causes of the fall of ministries, and these have produced the most appropriate implement, namely, the interpellation.

*Second*, is the interpellation a good means of administrative control? It is certainly a frequent and sharp means, which causes ministers constant anxiety for the quality and direction of their policy and departments. Even where the interpellation is withdrawn and never debated, it is a threat, and we have seen that many are taken to an issue. But it cannot be good for ministers to be in hourly peril of fall, for this prevents them from attending with independent mind to the solid and long-period merits of policy, shakes their confidence, and puts a premium upon window dressing. There are some things which the deputy or the ordinary member of the parliament cannot appreciate until he himself is in command of the actual administration of a department. To question is often enough, with the ultimate reserve (not the immediate threat) of a right of destruction if the question is not properly answered. Interpellations, however, have been developed rather destructively. They too often united factions into a temporary and sudden opposition only for the purposes of killing a ministry, and the main intention was not firmly to direct a government which is to continue in office, but to mend its ways. The system is too harassing when we consider the vast amount which a minister must do if he wishes to control his department with any firmness and completeness. Usually, however (and the figures given bear this out), the deputies were content

<sup>49</sup> Summary (1924-28):

with a really tumultuous oratorical jubilee; they did not mean anything by it, and the minister was able to get his Order of the Day voted after a general political address which concerned itself not very much with the details supposedly under cross-examination.

[\* See *Addenda*, p. 959.]

*The Parliamentary Commissions.* It has been made clear that the commissions have so developed as to exert a steady and not entirely wholesome pressure on legislative work. The truth is that the commissions discovered, by accident, an outlet for the repressed ambition of the ordinary member of the legislature, and have proceeded and will proceed to the point where something forcibly stops them. Their members can hardly be blamed for desiring not to be merely voting cattle. Their practices, however, while they have the effect of controlling administration, go too far, for they are neither so continuously interested nor so closely concerned nor so responsible as the minister, yet he is liable to constant interference and criticism of a dangerous nature.

French ministers complained all through the interwar years of being subject to "twenty legislatures," that is, the parliamentary commissions, and they were indeed excessively put on the rack of questioning and cross-examination. The public benefit was small as the proceedings were private. The commissions considered themselves to be as important as (if not more important than) ministers and officials, whose time they wasted both at sessions of the commission and visits to the departments. It may be that the bureaucratization of the French civil service was due largely to the bludgeoning tactics of the commissions. Ministers could bring their officials along to answer the questions and criticism of the commissions. On the whole, French control of the executive is too interfering at some points, and non-existent at others. It is destructive rather than corrective. But a proper fusion of the methods of questions of the House of Commons and the committee hearings of the National Assembly offers a feasible way of improvement.

It is a question of proportion: how much to control or not to control? Therefore it is also a question of temper and good sense, as well as institutions. The French example of committees (commissions) of the Assembly endowed with a power to exercise administrative control has often been commended to English students.<sup>51</sup> It has hitherto been repudiated by leaders of Parliament, especially governments in office, on the ground of the excessive interference in day-by-day policy and the continuum of administration.<sup>52</sup> The objections are very weighty. But England, like the United States and France, may have reached a point where the size and importance of the administrative apparatus is so massive that such control by parliamentary committees, multiplying the scrutinizing power of the legislature and with expert staffs, may be unavoidable.

Weimar Germany followed the same general mode of parliamentary control of the executive as France. Questions, however, "small questions" as they were called, had to be endorsed by fifteen members and were answerable either in writing or orally during one hour of one sitting per week. Interpellations needed the endorsement of thirty members and had to be concisely and clearly drafted. Ministers set the date of discussion, and if they refused to answer altogether or for more than a fortnight then the *Reichstag* could put the interpellation on the Order of the Day. The interpellator was permitted an explanation of his question, and thereupon the minister replied. But only if fifty members requested a debate did one follow. Further, if a resolution was to follow upon the debate, at least thirty members were needed to support it, and as many members could demand that the resolution be examined by a committee before a vote was taken. If the interpellations were so many as to endanger the due completion of business, the *Reichstag* limited the interpellations to special days. It will be seen that the German system set

<sup>51</sup> Cf. Third Report, Select Committee on Procedure (1946).

<sup>52</sup> Cf. *ibid.*, *passim*.

certain limitations upon the minorities which could hold up ministers. The limitations did not appear to be too severe. Virtually the rules said that only in matters which were important enough to find thirty who object could the *Reichstag* be troubled with their discussion, and this seems to me to have been more reasonable than the French practice, which though ideally splendid and democratic down to the meanest of individual members of the Chambers, makes democracy a farce by stopping publicly beneficial government for the benefit of the ambitions and vanity of deputies.

*Committees for Recess and Foreign Affairs.* The *Reichstag* committees were also continuously in touch with administration, but by no means so fussily as the French commissions. There were two committees mentioned in the constitution whose theoretical interest was very great, and the experience of which is worth a little attention.<sup>53</sup> We observed that however efficient parliamentary control is, there is still a portion of every year when there is no control at all. For this all ministers thank God; and both for the freshness of mind of the legislators, and their visits to their districts, the break in their sessions is beneficial. The makers of the Weimar constitution provided that a standing supervisory committee ("to safeguard the rights of Parliament") should function during recesses. Its number was fixed at fifteen, and later (1925) at twenty-one, and later still, twenty-eight. It was composed of members of the various parties. It did not sit continuously, but occasionally, in the recess. It confined itself to the discussion of the most serious events of the day: e.g., state of emergency in Bavaria, increases of salaries in the civil service, execution of the law relating to the defense of the Republic, financial guarantees to certain business undertakings, application of the budget surplus to the aid of agriculture injured by storms, and various statutory orders of importance. This seems to me to be an important institution, especially as it did not

worry the government continuously. It is enough if the government is aware that a representative of the legislature is existent to raise questions where deficiency or critical innovation is concerned. It is notable that the French constitution of 1946, article 12, provides for such an inter-session supervisory committee "to exercise control over the actions of the Cabinet." It is the Assembly's secretariat, elected, as we have described, by the political parties according to their proportional group strength.

The second committee which found mention in the Weimar constitution was the permanent Foreign Affairs Committee. Its institution was the direct result of German democratic dissatisfaction with the secret conduct of foreign relations, and of a very common belief that if only the people were consulted, war would not lightly be undertaken or produced by unwise alliances and engagements. This view was extensively held, though it is very doubtful whether improvement is possible in the present stage of human greed and popular morality and wisdom. However, one thing is certain: that publicity of diplomatic negotiations is the first stage in preparing the mind to face the issues and so, perhaps, in the long run to change the present condition of international and domestic political morality. To this end the ratification of treaties by the legislature is a necessary step. America, as we have already shown, has both these institutions. France has both these institutions. In England, the making of treaties is still considered by the Conservative party to be a part of the royal prerogative, not needing ratification by Parliament, though this may be permitted, as of grace, to discuss treaties, while the Labour party submits treaties and presumably would abide by a vote of Parliament—yet no Foreign Affairs Committee exists although many people have demanded it.

In Weimar Germany there existed a standing Committee for Foreign Affairs, consisting of twenty-eight members. Its sessions were, like those in France and the United States, not open to anyone else except members of the committee. It

<sup>53</sup> Articles 34 and 35.

sat very often and heard ministers on current negotiations, or on events which affected or were likely to affect the *Reich*.<sup>84</sup> This meant that at least twenty-eight members and their substitutes and parliamentary friends were in touch with the march of events, and were able to raise an alarm when necessary. Further, ministers realized that there was a watchful committee, including members of the minority, which required a good reason for each stage in policy. The committee was often faced with an accomplished fact because the government negotiators had to make binding engagements. (Exactly this was complained of by the members of the French Assembly's Foreign Affairs Committee at various stages of the negotiations in May and June, 1947, of the six-power agreement regarding western Germany.) In spite of this, the mere presence of the committee and the need to answer its questions must have worked to influence the mind and activity of the ministers. The *Reich* Committee continued between parliaments, as well as between sessions.

*American Methods of Controlling the Executive.* In the United States the very basis of the constitution is that each branch of government shall go its separate way, and the executive finds no place on the floor of the House or the Senate. Attempts have been made to make the twain meet—in the committee stage of bills, and in the steady relationship between the Congressional leaders and the President and his cabinet. Yet these are not enough to satisfy Congressmen, or, indeed, the actual objective need for Congressional control. Congress has proceeded to control (1) by voting the estimates in very great detail, (2) by passing many acts regulating the departments and their functions in profound detail, (3) by discussing and voting detailed resolutions recommending certain lines of policy, and finally (4) by conducting investigations.

The methods here used have some merits and some deficiencies. They are overdetailed in matters of personnel, expenditures, and the structure of admin-

istration, and are not sufficiently broad and probing in the dynamic process of current activity. They are in annual stages: the controlling stipulations either occur before administration starts, if the statutes contain them—or else they come after the year for which the appropriations have been made has gone by. It is undoubtedly true (I have seen this from the inside) that the anticipation of being interrogated exercises a controlling and guiding effect on officials and their political chiefs. This could be improved in two ways. The first is by open, public sessions of the committees, for the temper of administrative criticism is in the long run more reasonable when conducted in public. Second, the narrowness of some of the committees in scope is to be corrected by the recent reductions in the number of the committees.

It will be observed that the United States Congress is still weak in something of the nature of the British system of public cross-examination of current policy. The need is met to a small extent by debate in the Senate, and if there is any justification at all for its want of curbs on debate, it lies in this, that the Senate can turn its attention at any time to some administrative scandal, and *a propos* of something else, relevant or irrelevant, make known its views. But the merits of the British question hour—inconstant and in open forum—are certainly lacking. It has often been proposed that they should be supplied. A joint session of the two Houses at some convenient time—perhaps twice a week—would be of value, and should be experimented with. Yet there are drawbacks. The British system is not one that merely calls for information. Questions are a means of exerting discipline over the ministers and officials, because an answer is a commitment, and to discredit the minister is a stage in the game whereby the opposition appeals to the coming verdict, at the next election, of the people against the government. But in the United States the chief executive could not be interrogated. He would not submit to it; he has even on occasion ordered his own heads of departments not

<sup>84</sup> Fr. Poetsch-Heffter, *Jahrbuch des öffentlichen Rechts*, (Berlin) XIII, 80.

to give Congress the information asked for, and here the law stands on his side.<sup>55</sup> None of his cabinet, when questioned, could commit the President, and if they did not commit the President, much of their value would be lost. Hence, the cardinal virtue of British questions—that they commit the executive—is not available in the United States system—the bogey again, the separation of powers.<sup>56</sup>

The characteristic inquisitorial method of supervising the executive in the United States is by Congressional investigations. Congressional investigations appear to have no constitutional basis excepting as an implication of the legislative power of Congress. Whatever the constitutional power of Congress, it has certainly cast its net of investigation very wide and deep, and in some cases (such as the Teapot Dome scandal, or the stock-exchange scandal, or the Garsson-May and Hughes-Myers war-contract scandals), has unmasked real villainy, or (as in TVA) has opened up the record and shown the baselessness of slander. Yet such a procedure is occasional, not continuous; it is cumbersome, and very slow. When it does come, the actual hearings develop almost into a prosecuting criminal inquiry, or, as Walter Lippmann has said, into a "wild and feverish man-hunt in which Congressmen do not stop at cannibalism." This is a grave infliction on officials. Yet investigations do, occasionally, force officials to make a valuable resurvey of their objectives and methods.

The basic governmental weakness of this way of attempting to control the executive is that after report, there is no guarantee of improvement at all. For legislature and executive, being separate, tend to become hostile, and refuse to take each other in good faith, and there is nothing to remedy this.

The report of the Joint Committee on Reorganization of Congress made the very

wise proposal (15) that the practice of creating special investigating committees be abandoned. Instead, it proposed that the regular standing committees be the continuing supervisors of the administration of the law, with the power of subpoena. The advantages of this proposal, carried into formal effect by the Act of 1946, are obvious and abundant. But the special investigating committees have not ceased to be appointed.

The different methods and spirit of parliamentary control of the executive prevalent in England are well expressed in some answers given by the Rt. Hon. Mr. Herbert Morrison, then Deputy Prime Minister, to questions asked by the Select Committee on Procedure in March, 1946. He said: <sup>57</sup>

... it is perfectly proper and, indeed, to the public advantage that Parliament should jump in; a short, sharp vigorous debate on the adjournment, even for only half-an-hour, in which the Government is thoroughly exposed and knocked about, would have a far more rapid, beneficial effect than a number of meetings of a select committee, the result of which may be that the Department may become demoralised waiting for the select committee's report, and it might, indeed, slow up the procedure of disposal . . .

But I do say, on the point of exposing a scandal, that a row on the floor in my judgment is quicker and the execution of the axe against the Minister is sharper than in the case of the necessarily more leisurely investigation of a select committee . . . sometimes party bias—a sharp vigorous attack—is in the public interest, and if a Minister is slipping up or something is badly going wrong, the quicker he is knocked about with all the bias, vigour and energy of which the critics are capable, the better. I want Ministers always in their lives to be apprehensive about these potential sharp and vigorous attacks. That is, indeed, under our Constitution the justification for the existence of the Opposition. It is a great blessing, and a great advantage always; and sometimes a great nuisance. But that is what it is for.

#### CONCLUSIONS

THIS chapter has thrown light on the immense amount of work society has thrust

## DICTATORIAL LEGISLATURES

upon modern legislatures. They desperately struggle with legislation and the control of the administrative departments. They are oppressed by the small amount of time at their disposal, especially if they are serious in a desire to mix with the people of their districts and to move about in the rest of the nation. The legislators need respite from the running of small administrative errands to which their constituents compel them, most pathologically in the government of the United States. However they may be chosen, or upon whatever qualifications, their duty indubitably requires them to specialize to a high degree in knowledge of the apparatus of government in order that they may master the methods of mastering it and may compel it to be the able instrument of a complex society with a passion for enduring freedom. It is an immense responsibility: so onerous, when one looks at the apparatus closely, that one wonders how even the small proportion of legislators who do rise to their obligations have been able to succeed. Above all, in an age of comprehensive government activity, involving the future as well as the present, the executive apparatus is stupendous in its extent and penetration. All the devices we have presented as constituting the machinery of control need repair and rational refinement. Their purpose, methods, and opportunities need also to be imparted to the people, whom they are to help and from which they in turn may get much decisive support.

Hence the vital importance of arranging for open public debate and for questioning the executive in a procedure which is accessible to people and press. Legislatures and executives, but the former more than the latter, have public teaching responsibilities. Their debates can be consciously made part of the regular education of the people. (They *are*, willy-nilly.) This does not call for broadcasting legislative proceedings—for the chance of an exciting debate on an important topic is hard to measure beforehand. It does call, however, for the decision on matters of principle in the full assembly,

or where relegated to committees (which should be as limited in use as possible), to open sessions there.

I am led to the conclusion that much larger parliaments are inevitable necessities of the modern state. They need more committees, or at any rate enough of them, and a representative, which means a larger, number of the legislators on the committees. If these, then, in the process of lawmaking and the control of administration, engage an excessive amount of the time of officials, the answer is that some small addition to the number of officials may be required in order that their number may be adequate to the task of answering for themselves and their colleagues to their controllers. This seems to me to be only rational.

## DICTATORIAL LEGISLATURES

THERE is little point in talking about dictatorial legislatures. There is much more point in talking about dictatorial parties, and some attention has been given to this (p. 302 above). The *Reichstag* under the Nazi government was a pure facade, and the assembly, whose members had been carefully chosen by Hitler's hierarchy before submission to the electorate, were a mere claque to rise and applaud as directed. The *Reichstag* could be called only by the *Führer* and the president of the *Reichstag*, Goering. The laws, by force of the Enabling Act of March, 1933, were made by the cabinet, without discussion or ratification by the *Reichstag*.

The Soviet Union has a quadrennial election of the Soviet of the Union and the Soviet of Nationalities. They possess the supreme power in everything—law and administration. But the effectiveness of the Soviet is limited by two factors of dominating potency:

The *first* is the control of the elections by the Communist party, the only legal party and the only one that operates practically.<sup>58</sup> *Second*, the Soviet elects from its midst a body called the Presidium. This consists of thirty-seven members; its chair-

<sup>58</sup> Cf. p. 255 above.

man is the President of the Soviet Union. The Presidium carries on the government of the Union in the time the Soviet is not in session. It is partly a legislative committee, and partly a cabinet which exercises decisive control over the Council of Ministers (formerly People's Commissars) in their everyday duties of administration. The Presidium is the continuous government of the Soviet Union in fact as well as law. And more so than in law, because (a) it has the right of making ordinances with the force of law (in fact, this is the regular process of lawmaking, leaving out such a law as the one that establishes the five-year plans); (b) it can dismiss and replace ministers, as they are incompetent or retire, in the intervals of Soviet sessions; (c) it can call an election if the two assemblies are in deadlock; and (d) while the assemblies are not yet elected, it exercises power.

The crucial point is: can the Supreme Soviet operate of its own will? The answer is "No." For it is convened by constitutional stipulation twice a year by the Presidium. But the constitution does not say when and for how long the Soviets are to be convened. In fact, the assemblies are called for sessions of something like seven to ten days, on two occasions in the year at a date that pleases the Presidium—on one of these occasions to accept the budget!<sup>52</sup> We know enough already about the difficulties of lawmaking in nations that are far from even approach-

ing the U.S.S.R. in the range of their state activity to know that this is utterly inadequate as parliamentary government, or democratic control.

The mark of independence of a legislature is whether it can convene itself, regardless of the will of the executive. The question hardly arises in the British constitution because of the close correspondence of legislature and cabinet: the House is master. In the Weimar constitution it was stipulated that a petition of one third of the membership could get the *Reichstag* convened—a valuable provision. In the constitution of the Third Republic, the chambers met annually in January; remained in session at least five months; could be and were convened by the President (equals cabinet) at other times; and above all, could convene themselves if an absolute majority of the members of both houses required it. In the constitution of 1946, there is again provision for annual meeting; the total duration of interruptions of each session cannot exceed four months; it is thus in continuous session. Moreover, when it is not sitting, its *bureau* may convoke the Assembly, and it must do so when requested by one third of the deputies or by the premier. The United States Congress is practically independent, within the constitution, of the executive in the periodicity and length of its sessions. In democratic systems the legislature dominates the executive: in the U.S.S.R. in practice, and without constitutional denial, the Presidium dominates the Soviets. Or, in other words, the land is governed by the party and the administration, while the Soviets say "Aye," with no dissentients and no absentees.

<sup>52</sup> A good illustration for those who do not read Russian is in the verbatim report of the second session of the Supreme Soviet of the U.S.S.R., August, 1938 (Foreign Languages Publishing House, Moscow, 1938).

## *Proposals and Devices for Improving Democratic Legislatures*

THE actual electoral and parliamentary process already described presents a picture vastly different from that drawn in the pages of Rousseau and elaborated by democratic writers in the nineteenth century. The voter is becoming more than formally sovereign and equal: if he is free, he is not isolated; if unaided, he is not always rational.

In order to express the changing pressure of shifting interests, diverse and competing even within each man and woman, legislative assemblies are guided by all sorts of advisers and deliberative bodies. Advisory committees, commissions of inquiry, economic councils, and the "lobby" exert influence on cabinet and civil service. To judge the efficacy of this concourse of representative institutions, we must consider it as a single operating complex. It is not as yet well systematized, but certainly year by year the parts, old and new, are fitted together more rationally.

Yet there are defects, the chief of which are brought to light by (a) the theory of guild socialism; (b) discussion of the nature of the electoral system; (c) the problem of direct legislation; and (d) the problem of the compulsory vote.

### GUILD SOCIALISM<sup>1</sup>

GUILD socialism is the product of two streams of thought: socialist and demo-

cratic. These together propose a state in which there shall be at once strict communal control of production and distribution and yet extensive self-determination. The theory of its political machinery revolves around the defects of representative government.

*The Theory and its Defects.* It is alleged that the central fallacy of representative government is the belief that the representation of one person's will by another is possible. The will is too comprehensive and too subtle in its multitude of components to permit of representation (Thus, originally Rousseau; thus, of recent years Cole and Webb.<sup>2</sup>) But if general representation is impossible, then a territorial system of representation of equal voters in their districts based upon it must be defective. How, in fact? The electoral issues submitted by the parties must be superficial, as empty as they are extensive. They must be dealt with centrally. They must be a confused multiplex, upon most elements of which the electors must necessarily be ignorant. Finally, the argument runs, the central legislature cannot help treating all citizens uniformly instead of diversely. Such a

<sup>1</sup> Cf. G. D. H. Cole, *Social Theory* (London, 1920) and *Guild Socialism Re-Stated* (London,

1920); G. C. Field, *Guild Socialism* (London, 1920); W. Y. Elliott, *The Pragmatic Revolt in Politics* (New York, 1923); and F. W. Coker, *Recent Political Thought* (New York, 1934).

<sup>2</sup> Sidney Webb, *A Constitution for the Socialist Commonwealth of Great Britain* (London, 1920), Introduction, p. xiii ff.

system is actually based on territorial constituencies in which, in fact, there is no real community of feeling or will since, though people live in the same neighborhood, they pursue very different interests. What, in fact, is there to bind the incongruous, and often hostile, residents of any little area you like to take into a constituency? What unity is there which can be said to be representable? These critics answer, "Nothing."

Now this criticism of representation is true enough for actual developments in representative government since Rousseau's time to make it, as a practical criticism, rather immaterial. To temper centralization there is local self-government; to avoid legal uniformity there is the flexible application of statutes by rules and orders made by the administration, whether in the central or local bureaucracy or through administrative tribunals, before which the interests concerned are represented. In most government departments there are councils composed of experts and representatives of relevant organizations with consultations, or conferences, or hearings, or "adversary" hearings. Agents are elected to the legislature, appear before legislative committees, negotiate with the cabinet and bill draftsmen. All these formal agencies of decision take no decision before previous discussion of their intentions with the producers, consumers, and cultural organizers. Political parties themselves are constituted by negotiation with certain groups.

If account of all this is omitted, the nature of modern representative institutions is gravely misrepresented. It may be rejoined that only exaggeration can produce desirable reforms. But this is only partly true, for in the exaggeration itself there necessarily exist the germs of serious mistakes. The fascist régime in Italy was based, so far as theory is concerned, upon criticism of representative democracy analogous to guild-socialist criticism, and naturally what was deemed to be its most powerful pillar was precisely its most faulty one, namely, the portrait of Rousseauite "free" and "equal" abstractions

unqualified by all the actual devices of modern guild socialism.<sup>8</sup> In *Mussolini's Italy* I have shown how the fascist system, by instituting twenty-two corporations as the "representative" elements, really divided the land into twenty-two occupational parties—or tended that way. Also I demonstrated that the corporations were not allowed to will the laws: the integrating will was Mussolini and any cronies he cared to consult. The corporative or guild socialist system is defective as an integrating scheme of society, and would break the minimum foundation of permanent interests, the creation of centuries. The corporative state worked under the threat of coercion by the integrating element, the Fascist party. Without dictator and dictatorial party the corporations could not march together.

If the principle of government by consent of the governed is accepted, and if that consent is admitted to be shown in free elections, then the integrating will of the nation so emerges from election. If an integrated will is desired, it is most likely to be achieved on a territorial basis in which each electoral district assembles the voters, who are on principle regarded as equal. This is, at any rate, the principle which divides citizens from each other least; and indeed, it can be argued that its appeal to equality and its frown on personal and social and economic differentiae of any kind encourage solidarity. Within the operation of this principle, it is then possible to make many subordinate concessions to the differences of corporate interests among men and women, and to allow for their representative influence. But once the territorial idea of representation is denounced, and once corporate occupational representation is put in its place, there arises the insoluble problem of proportionately representing the corporate bodies. The problem is insoluble by voluntary agreement of the corporate bodies, because they will not accept representation according to their mere numbers. Each industry or occupation or pro-

<sup>8</sup> Herman Finer, *Mussolini's Italy* (New York, 1936).

fession regards itself as socially and economically important beyond its simple numbers. It speaks of its production for the nation, its value as a component of national wealth, or (if they are doctors, let us say) of its basic importance as the foundation of all national well-being. They attempt to substitute a calculus of value for the simple arithmetic of men as men.

This so-called occupational or functional representation is socially and politically divisive if it is sovereign in the power to make law, because its animating spirit begins with the idea of differences, and not, as does the idea of territorial representation, with the idea of the equality of citizens. It confuses interests with will. Therefore occupational or functional representation can succeed only where it is subordinate; and it can be subordinate either to the democratically expressed will of a free electorate, guided by political parties, or to a dictator. In Mussolini's case it was to a dictator. His theorists asked me why England had not instituted the system of guild socialism (to them, the "corporate state") when England had been the originator of the theory. The answer was that Parliament was supreme, based on the freely expressed will of the people as equal citizens. Fascist Italy had abolished a free and equal electorate as the political will of the nation—hence the corporations could flourish, but still only as advisers, while the dictator alone willed their comparative ratios of representation.

Experience with economic councils (Weimar Germany and France) also demonstrates the truth of a corollary of this view, as we shall see presently. Serious difficulties had to be overcome in the apportionment of members for each group, and even when an arrangement was secured, hardly anyone was satisfied. Now, these fierce collisions occurred in bodies not with a power of final decision but simply with a power of consultation. Whether or not any of these bodies were in the majority in the economic council, their views were put before the public and ultimately modified by a *Reichstag*

or Chamber elected by territorial constituencies. Is it really conceivable that one could find even a temporary solution if the Guild Congress were a sovereign body?—if it handed down binding decisions and not mere expressions of opinion? The search for a numerical formula would surely end—as it threatened in actual experience—in a decision that since no ultimate test of the social value and conceit of each occupation could be objectively established, the only permanent peace-giving formula is: equal and universal suffrage to a common legislature: that is, the present system. Further, the assumption that men are so much more interested in the affairs of their occupation than in others is not borne out by analyses of voting in their occupational councils.<sup>4</sup> Recent studies have shown that a terrific amount of effort and attention to technique are required to get employers and employed to mind their own business.

The real difficulty, of course, is the management of a vast state which integrates thousands of different personal, local, and syndical interests. It is not soluble by disintegration and the consequent encouragement of guild conceit and selfishness (have we not all an interest in the prevention of corporate and personal abuse of possessions and cultural values as well as in a *post facto* correction of them?). But it is soluble by integration first, and then devolution—legislative and administrative—and always by consultation of the associations and localities. In the center of the integrative process are the communities we call political parties, and legislatures, and the conception of the numerical equality of citizens. Only those who are presumed to be equal will express themselves freely and accept the final decision; only those who are denied their claims to superiority will listen and obey. The present system, put into the

<sup>4</sup> Cole has handsomely thrown over the theory of representation he once held—cf. *The Next Ten Years* (London, 1929), p. 158 ff.—largely through a growing disbelief in his former theory that representation was the supreme good, and that representation must be ubiquitous.

## IMPROVING DEMOCRATIC LEGISLATURES

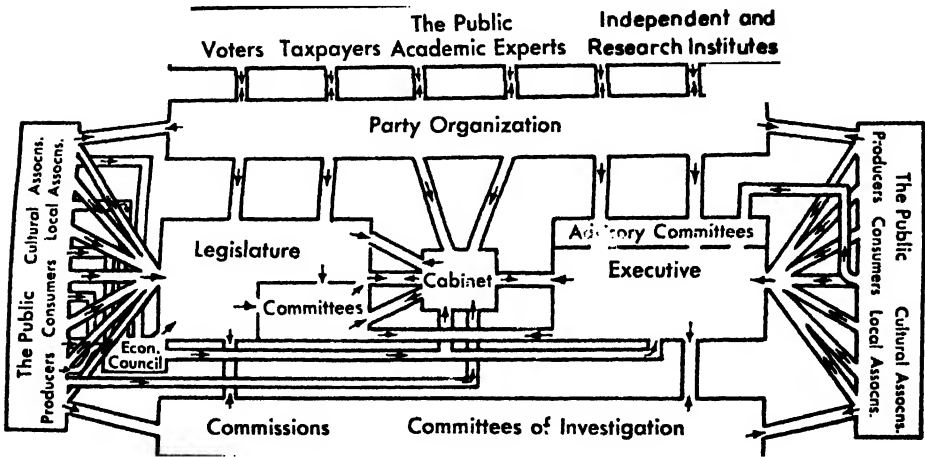

form of the accompanying diagram, gives a good idea of the integration of, and mutual influence in and outside, the classical conception of representative government, and shows graphically how institutions have been created to overcome the chief defects announced by critics. (Yet, as we have amply seen, there is much room for improvement in the present system.)

riot decree of 1925, but raised to 173 in the law of March 19, 1936—also was based on delegates from the various occupational groups. Without entering into any great detail, this must be said of these bodies:

First, the *Reichwirtschaftsrat*: Though the government and the *Reichstag* were required to consult it before the introduction of laws of fundamental social and

### THE VISCERA OF THE MODERN LEVIATHAN

*Showing the Continuous Working Relationship between the Various Electoral, Vocational, Legislative, and Executive Organs of the Modern State*

**Economic Councils: Germany and France.** Weimar Germany and Third Republic France attempted to steer a course beyond territorially based legislatures to include corporate assemblies: the former in the *Reich Economic Council* (*Reichwirtschaftsrat*) and the latter in the *Conseil Économique National*.

The former, based upon article 165 of the Weimar constitution, was an assembly of 300, later 200, formed by (1) delegations from employers and (2) employees of the occupational organizations, represented after a long process of cantankerous bargaining by numbers settled by the government, and (3) a group of government-named experts and consumers' representatives, to act as a balance. The latter—a body of 47 according to the Her-

economic importance, they very rarely did. Nor did the departments often ask for its advice. As soon as it came to speak as an assembly, it acquired parliamentary pretensions, and therefore was too much a rival of the *Reichstag*. Therefore it restricted itself to committee operations, in which its advice was technically good. But it split up into employers', workers', and consumers' groups for operation and voting, so that a blended policy was not obtainable from it. Hence it was cold-shouldered by everybody, particularly by the *Reichstag*, which was jealous, and therefore by the government, which was dependent on the *Reichstag*. It soon lost influence. A parliamentary assembly, elected by the people, believes it is unteachable as an expert on what the people want and

need. It is, Hitler abolished the *Reichswirtschaftsrat*.<sup>5</sup>

The scope of the *Conseil National Économique* was, according to article 1:

the study of problems affecting the national economy, giving opinions on government and private member bills when so requested, examining methods by which such bills may best be administered, and proposing measures for the control and organization of production and exchange.

The prime minister or his deputy was chairman.

In the thirteen years of its existence, the council was useful in making wide-ranging studies and in advising government departments. It, like the *Reichswirtschaftsrat*, worked through committees. The French government was obliged to submit to it bills of economic and social nature, and to report to it within a month what action had been taken on the council's recommendations. It prepared and adopted many reports on problems such as housing, the economic equipment of the nation, transport, foodstuffs, collective-bargaining contracts, and agricultural policy. It is possible to trace a causative influence of the council on the law on transport of 1934, on the collective-bargaining contracts and the forty-hour week of 1936, and, possibly, on the Monnet planning policy for capital equipment developed after World War II. Its recommendations to the government have, on request, included those on French port facilities, refrigerated storehouses, air routes to the East, public works, and the Commerce Exchange.

The Chamber of Deputies overcame an early jealousy of the council. It is noteworthy as a tribute to belief in its effectiveness as an adviser<sup>6</sup> that the constitutions of 1946 and 1958 included an Economic

Council, and this with little debate, as a matter of course.

The Economic Council was established by the constitution<sup>7</sup> of 1946 (it has been renamed Economic and Social Council in 1958) because the Third Republic's Economic Council, though finally well-founded on the law of 1936, did not thereby acquire a status of clear and significant influence in relationship to the Chamber of Deputies and the Senate. Title X, art. 69-71, of the constitution of 1958 prescribes:

The Economic and Social Council, consulted by the Government, gives its opinion on Government bills, draft ordinances and decrees, as well as on private members' bills which are submitted to it.

The Economic and Social Council may also be consulted by the Government on any problem of an economic or social character affecting the Republic or the Community. All Government plans and outline laws of a social or economic character are submitted to it for advice.

An ordinance of December 29, 1958, organizes the Council, along the same lines than the Council of the Fourth Republic.<sup>8</sup> According to this law, the Economic Council is competent to examine bills of an economic and social character, excluding the budget and international treaties of an economic and financial kind, which require the approval of the National Assembly.

It will be observed that the status of the council is clearly consultative in this chief sphere of its competence. It cannot force a government to decide to consult it. In 1946, there were some members of the Assembly who urged that the Council should have compulsory jurisdiction. But this idea was rejected on the ground that the Economic Council would then be "corporate" in character—that is to say, it would have a part in sovereign legislative power, or to put it in other words, would be a part of the will-organization of the nation rather than merely a thought- or

<sup>8</sup> Law of October 27, 1946.

interest-organization.<sup>9</sup> The *rapporteur*, a socialist, pointed out that to have accorded to the Economic Council an obligatory status would have meant the gravest submission of the agenda of the National Assembly to the Economic Council, since all laws have more or less an economic, social, and financial aspect.

The law goes on to say that the Economic Council *may* be asked for advice on drafts of simple decrees (rules and regulations) and of rules of public administration concerning the national economy. It *must* be consulted during the drafting of rules of public administration made in application of the laws which have been submitted for its advice. It *may* itself undertake the examination of economic, social and financial questions, and for this purpose conduct the necessary inquiries, and in conclusion put forward opinions and recommendations.

The Economic Council gives its counsel on the Plan,<sup>10</sup> and the bills and questions on which it is consulted by the government; on bills submitted to it by the National Assembly and its commissions; or on bills which it itself takes under advisement. It is limited in the time allowed it for such consideration to twenty days, or to the time set by the body requesting advice. Its opinion on rules of public administration arising out of law which it has considered must be given within thirty days.

We have already suggested that the procedure of the National Assembly has provided for the interweaving of the work of the Economic Council and the operations of the Assembly and its commissions, and the law on the council further provides that the opinions of its minority as well as its majority shall come to the ear of the Assembly. Its recommendations must be printed and disseminated among the deputies, and must be read out before the opening of a debate in the Assembly. Furthermore, if the competent minister or commission wish it, the *rapporteur* of the council can participate in

the Assembly's debates in order to put forward the views of the council.

Finally, at the request of the parties and of the interested ministers, the Economic Council can be seized with any question relative to economic and social disputes and may eventually play the part of arbiter.

of the interested ministers, the Economic council, there occurred hot disputes of the order already mentioned of the Weimar *Reichwirtschaftsrat*: that is to say, disputes about the nature of the constituents and the ratio of representation. It was desired not to set up a competitor to the National Assembly, which must be and remain the central sovereign body in the government. It was not desired to duplicate the many diverse consultative bodies which advise the departments, though whenever the Economic Council wished to bring them into its proceedings it would be able to do so. It was not desired to gather together a body of diverse notables who would be little more than honorific additions to it. Nor was it sensible to stuff the council with every possible representative of every possible interest in the country. In other words,

The commission preferred the conception of a council with inter-professional recruitment, less packed, but more synthetic in its structure, as well as strongly articulated, and above all not running the risk of appearing . . . as an economic hold-all welcoming in its precincts representatives not infrequently honorific.<sup>11</sup>

The Economic Council contains 205 members who are appointed thereto for five-year terms. They are thus distributed:

(1) 45 nominated by organizations most representative of workers, employees, officials, technicians, engineers, and managers;

(2) 22 representatives of industrial enterprises among whom: (a) 6 from nationalized enterprises, (b) 14 representatives of private enterprises, among which a distinct and proportional representa-

<sup>9</sup> *Débats parlementaires*, October 3, 1946, p. 4372 ff.

<sup>10</sup> Cf. below, Chap. 24.

<sup>11</sup> Pronteau, *rapporteur*, *Débats*, October 3, 1946, p. 4370.

tion is assured to big, small, and medium enterprises;

(3) 9 representatives of commercial enterprises, among which a distinct and proportional representation is assured to small commerce;

(4) 10 representatives of artisans.

(5) 40 representatives nominated by the most representative agricultural organizations, of whom 5 must be from the cooperatives.

(6) 15 persons qualified in the economic, social and cultural fields.

(7) 15 representatives of social activities, chosen, in particular, among representatives of cooperatives, health and family associations, etc.

(8) 7 representatives of miscellaneous activities, such as tourism, etc.

(9) 2 representatives of the middle classes.

(10) 10 persons qualified for their knowledge of overseas economic and social problems.

(11) 20 representatives of social and economic activities of Algeria and the Sahara.

(12) 10 representatives of economic and social activities of overseas territories and of Martinique, Guadeloupe, French Guiana and Réunion.

All the foregoing delegates are nominated, for each category, in part by professional organizations which are most representative, and in part by the territorial groupings of chambers of commerce and chambers of professions.

It should be observed that the only category which is not designated by a constituent group is that of the intellectual workers. It was proposed, but rejected, that these should be designated by associations, universities, or scientific academies. They are nominated by the government.

Ministers, undersecretaries of state, and commissioners named by the government have the entrée to the Economic Council and must be heard when they request it. Members of Parliament may attend the sessions of the Economic Council. The presidents and *rapporteurs* of the parliamentary commissions may attend the sessions of the council's commissions.

The Economic Council is mistress of its own procedure, and may conduct its discussions in open or closed session. The suggestion that it should regularly hold

public sessions was combated by the *rapporteur*, who disclaimed any intention to reduce the public impact of the council but drew attention to the observations of M. Cahen-Salvador, the secretary-general of the Economic Council of 1936.<sup>12</sup> Since these are so similar to those expressed in relationship to the privacy of the sessions of the *Reichswirtschaftsrat*, not *a priori* but after experience, they deserve quotation:<sup>13</sup>

How is it possible not to be anxious about the consequences of debates carried on in public?

The atmosphere of the Assembly may be changed thereby. The cordiality of relations encouraged by closed sessions risks attenuation or disappearance. Attitudes of command would replace frank explanation. Instead of precise discussion, oratorical tirades would reign. Members would seek less to convince than to parade, less to dissipate misunderstandings than to entertain them in order to draw advantage from them, less to discover motives for reconciliation than to display the reasons for disagreement.

Public deliberations followed with passion by interested listeners, spied on with a malicious vigilance by opposition newspapers, would soon assume, especially in a nation fond of eloquence, a spectacular turn. Words would take precedence over action.

The suggestion that the commissions of the Economic Council might take the place of the consultative bodies within the departments was rejected as mixing different functions. These were more specialized in composition and had a different and narrower purpose than the commissions of the Economic Council.

The composition of the Economic Council does not duplicate that of 1936, but is very similar to it.

We may conclude with the *rapporteur's* characterization of the Economic Council's function:<sup>14</sup>

The increasing complexity of economic problems, the extreme importance of their solution for the rebirth of the nation, and the technical knowledge this requires, establish a duty for government and Parliament alike of surrounding themselves with all the qualified advice necessary for the sound utilization of all the material resources of the country.

<sup>12</sup> From article cited, p. 307.

## IMPROVING DEMOCRATIC LEGISLATURES

Placed by the side of the National Assembly, the Economic Council is called to play a part of the first importance through its advice. It will enlighten it, orient it, and guide it in the discovery of the best solutions. And, concerning itself with very diverse problems, the Council will also express to the government the opinion of men who most usually taking a practical part in production, will bring along with the fruit of their special experience a desire to contribute to the co-ordination of the economic forces of the country.

One of the ideas leading to the creation of the *Conseil Économique* was, according to M. Cahen-Salvador, the desire—and certainly the need—to overcome the specialization of the government departments. His own words are very revealing, since he was not only the secretary-general of the prewar *Conseil*, but he was by profession president of a section of the *Conseil d'État*, that is, the supreme organ of administrative leadership. He said:<sup>15</sup>

Who does not see that each government department, having a defined sphere of power, is naturally inclined to make itself not only the interpreter but also the advocate of the demands of the professional groups which are within its province—and that the ministers, in their turn are—by inclination towards easy solutions, the fear of risks and conflicts, or the quest of popularity—very much readier to support the demands of their administrative clients than to discuss their rightfulness.

The potential value of such economic representative bodies is indubitable. Yet it is imperative that they should never be regarded as more than advisory, since no one would wish to confuse the line of the elected representative body's responsibility for policy. Nor must such an economic council trouble the pride of the popular assembly. It is necessary, though difficult, to arrange the timetable of legislation and debate in such a way as to take advantage of the timely advice of such councils. And, as the experience of the French Economic Council of 1936 suggested, much may be gained by deputing officials to sit with the councils and their committees.'

*Advisory Bodies in Britain and the United States.* In British practice, consul-

tation with economic and social groups occurs by direct contact between them and the executive and the legislature, and by the use of devices like the royal commissions of inquiry. In view of the success of these methods, it has proved unnecessary to provide an additional advisory body. The channels of consultation are so much more closely connected with the executive than the legislature that they are further examined in Chapter 23 on the British cabinet.

In the United States, the nearest approach—and a valuable one at that—to an extraneous, unelected advisory body was the National Resources Planning Board. Its composition and appointment were markedly different from the counseling agencies already discussed: it had a board of several departmental political chiefs, an advisory committee of three "experts" from outside, and a professional staff of full- and part-time researchers. It was an adviser to the executive, and, through its reports, a mentor of Congress and the public. But except for its postwar reconstruction reports (especially that on *Work, Relief, and Social Security*), its counsels were of very long-range outlook and of basic, scientific-research character (e.g., *Technological Trends*), rather than concerned with more immediate policies.<sup>16</sup> Nevertheless Congress regarded it with hostility: it might have outpaced the members of Congress in intellectual ability and public-spirited forethought. Congress abolished it. In so far as its functions survive—and certainly the need for its functions is still pressing—they have been assumed by the Bureau of the Budget and the research units of other executive departments. So long as Congress hears all interests in honestly conducted committee procedure, and so long as it is expertly staffed, this will suffice. But the executive branch still needs its own omni-departmental and especially omni-interest consultant body or bodies; for the executive has a vital legislative as well as politico-

<sup>15</sup> Cf. J. D. Millett, *The Process and Organization of Government Planning* (New York, 1947), especially pp. 137-52, for a thorough gifted analysis. Cf. also Chap. 26.

## ELECTORAL SYSTEMS

administrative contribution to make also. In part, the need is filled by the Council of Economic Advisers, a body of three appointed by the President, as required by the Employment Act of 1946. The act requires Congress to receive the council's regular sessional reports for study and to consider them in a special joint committee. This arrangement also is discussed further in Chapter 26 on the American presidency.

### ELECTORAL SYSTEMS

Now we have given reasons for doubting whether there is ever likely to be a representative system which does not depend, in the principal, decisive resort, upon decision by a majority of members representing the citizens as equal. Indeed, we are certain that in the long run there is no other alternative. Then the question immediately arises how best can one attain exact representation.

*Establishing the Constituency.* The ideal system—that is to say, a system having exactness of representation as its only object—would be that in which the whole nation was taken as a single constituency, where lists of candidates for the whole number of members of the legislature could be presented and advocated by anybody. Such an arrangement, if it could be organized, would provide an exact reflection of majority and minority groups. But its defects are not only serious, they are actually destructive of the values most people want from representative government. Because it presupposes a national campaign, it centralizes authority in the party machine to organize the issues and conduct the campaign. It permits the least degree of local and personal adaptation of the candidates. It abolishes by-elections. It makes the contact between voter and program immediate, when what is needed is the mediation of a candidate between the two, so that he may explain the program to the voter and modify it after observation of the voter's reaction.

In default of this arrangement, what is to be adopted?—the division of the country into constituencies sized according to

convenience and equity. Convenience implies that the constituency should be not too large for the maintenance of personal contact between candidate and voters, and, of perhaps more importance, between the local party associations and their clientele in the neighborhood. Equity implies that the constituencies shall be as nearly equal in population as possible. When this principle is applied, not once and for all, but continuously as the distribution of population changes in times of mobility—when it is applied simply and without “management”—then it can be taken by the law of averages, and in the long run, there will be no undue advantage to any party and no disadvantage to any, by reason of this cause alone.

Two practical questions then arise: (1) What is a reasonably sized area, and ought there to be only one or more seats per constituency? (2) In fact, are politicians so unfair as deliberately to produce or maintain inequitable election districts? A word or two on the second question first.

The United States more, perhaps, than any other country has familiarized us with the practice of “gerrymandering” (even as it has invented the word). To “gerrymander” is so to arrange the shape of constituencies that your own party's majorities, however small, are spread over the largest number of constituencies possible, and your opponent's majorities are made as large as they can be in each constituency certain to be won by him, but are restricted to as few constituencies as possible, especially where the contest is close. Now, men seek to cast out the devil from themselves by pledging themselves to a constitution. And in most state constitutions it is provided that electoral districts shall be compact in form, contiguous in territory, and contain the maximum possible equality of inhabitants. Yet even within those requirements the bosses and their henchmen act effectively. However, the system provokes retaliation and public contempt, and if the majorities are spread too well, a slight turnover in votes may cause a loss of the seat.

In England, redistribution has been decided on as an agreed all-party measure

# IMPROVING DEMOCRATIC LEGISLATURES

of both parties,<sup>17</sup> and has been carried out by an impartial body of commissioners.<sup>18</sup> On the whole, a laudable fairness rules the question. In Germany the principal unfairness until 1919 was in the obstinate refusal to redistribute seats which had been first distributed as far back as 1867; its particular system of proportional representation after 1919 was scrupulous in its equity. In France, what has been called *géographie de circonstance* was extensively practiced until the 1920's, more so before 1870 when the semi-autocratic executive had a vested interest in a pliable parliament. Under the rule of the parliamentary commission on universal suffrage and of the government, which introduced distribution bills, the amount of fraud was small. Like all the manipulators of redistribution, the government found the greatest difficulty in dividing well-knit neighborhoods, whether cities or urban districts, when their population was above the maximum number of inhabitants per constituency; and when the government had planned its redistribution, the parliamentary commission reviewed it in the light of evidence presented by the existing deputies. Yet until 1946 the constituencies varied all the degrees between 22,160 (Lozère) and 120,000 (Grenoble), though the aim was to put the regular minimum at 40,000 and the maximum at 100,000.<sup>19</sup>

*Single-member Constituencies.* The problems raised by single-member constituencies are different according as the majority required is absolute or relative. In the English and American systems, usually also in the British dominions, only a relative majority (known as a "plurality" in the United States) is required to win the available seat; in other words, whatever the number of candidates, the one at the top is elected. Now this may have results which may be considered to be highly inequitable, for it is

TABLE 14—BRITISH GENERAL ELECTION RESULTS, 1929 TO 1945, FOR SEATS ACTUALLY CONTESTED

Year	Party	Votes (in millions)	Seats
1929 <sup>a</sup>	Conservative	8.660	256
	Labour	8.385	288
	Liberal	5.309	59
	Others	2.94	5
	<i>Total</i>	23.647	608
1931 <sup>b</sup>	Government parties	14.532	493
	Labour	6.648	46
	Independent Liberal	.106	4
	Others	.371	5
	<i>Total</i>	21.657	548
1935 <sup>c</sup>	Government parties	11.790	405
	Labour	8.325	141
	Independent Labour Party	.140	4
	Independent Liberal	1.443	38
	Others	.300	8
	<i>Total</i>	21.998	596
1945 <sup>d</sup>	Labour (and L.L.P. and Common-wealth)	12.150	397
	Conservatives	8.665	189
	Liberals	2.240	12
	Communists	.103	2
	Independents	.157	14
	Miscellaneous anti-Labour (including Liberal National)	1.450	26
	<i>Total</i>	24.765	640

<sup>a</sup> Seven seats were not contested. Cf. R. W. G. Mackay, *Coupon or Free* (London, 1943), p. 33.

<sup>b</sup> Sixty-seven seats were uncontested. *Ibid.*, p. 34.

<sup>c</sup> Forty seats were uncontested. *Ibid.*, p. 36.

<sup>d</sup> Fifteen seats were uncontested, but they are included in the totals of the seats. Cf. Maccullum and Readman, *British General Election, 1945* (Oxford, 1947), pp. 248-52.

clear that as soon as more than two candidates compete, the topmost candidate may secure election by a minority of the votes cast in the constituency. This may produce injustices in some constituencies and general nation-wide misrepresentation.

<sup>17</sup> Cf. John Morley, *Life of Gladstone* (London, 1905), Vol. II.

<sup>18</sup> Cf. report of Electoral Boundary Commissioners, 1918, and Speaker's Conference on Electoral Reform and Redistribution of Seats, May, 1944.

<sup>19</sup> *Rapport Supplémentaire No. 4625* (Baréty), *Chambre des Députés*, 1927.

In Great Britain, for some years after the rise of the Labour party with the continuance of the other two parties, many three-cornered contests were fought, with perturbing results. The results are shown in Table 14.<sup>20</sup>

Now it may be argued that the luck of the ballot will be evenly spread among the various parties, as a whole. This may be so, and at one election luck was almost exactly evenly distributed. Yet it is only hazard. The progress of constitutional development shows a continuous desire of mankind to ascend from hazard to controllable principle.

What is to be done? Neither the French nor the Germans before the introduction of proportional representation nor many parts of the British dominions leave the matter to chance. They use either the second-ballot or the alternative-vote system.

*The Second Ballot and the Alternative Vote.* Both repose on the principle that no one should be returned to Parliament who only has the support of less than 50 per cent of the voters.<sup>21</sup> They make an attempt to secure an absolute majority for the ultimately elected candidate, but they proceed by different methods. The second-ballot system involves a general election which, in each constituency, gives either one of the candidates or none an absolute majority: if the former, he is duly elected; if the latter, then a second election occurs, when all the candidates below the top two drop out, and the second contest is between these two. This second ballot occurred in France up to 1914, a fortnight after the first; by the Electoral Law of 1927 it occurred one week after the first.<sup>22</sup>

Between 1946 and 1958, however, France introduced proportional representation, which is described presently; between 1951 and 1958, proportional representation was allied with a measure of majority system. In 1958, France returned to the two-ballot single-member majority system, after an extensive redistribution of prewar constituencies had been undertaken. The

German *Reichstag* up to 1918 is also presently described.<sup>23</sup>

The merit of the second ballot is that it gives people the opportunity of reconsidering their vote when they know by the first result that certain candidates are out of the running and that their choice is now restricted. Many cannot have the man or woman they most prefer; they are given the opportunity of deciding which of the remaining candidates is nearer their first preference. There is one other merit: the successful candidates will make law and control administration. It is, in the long run, essential that the general body of citizens shall be satisfied with the equity of the system of government, and they are most likely to be satisfied if it can be shown that government rests on a majority of popular votes as well as of parliamentary seats. Now, the majority produced by the system of the second ballot or the alternative vote is a kind of second-best, not a wholehearted first choice, and it cannot be called as sound a majority as if it were composed altogether of first preferences. Yet the people may think so, or at least be satisfied that this majority, however compounded, is better than pure minorities. The statesman cannot reject such a factor.

Yet decades of actual electoral experience have demonstrated serious demerits in the second-ballot system. They are concisely and authoritatively represented in a report of the French Chamber of Deputies:<sup>24</sup>

- (1) The respective situation of parties is falsified. It is impossible to gauge the importance of the various political groupings by reference to the results of the second ballot; the victories won on the second ballot are the product of a transaction most often obtained to the detriment of ideas and programs;
- (2) It often happens that these bargains are arranged under conditions which have nothing at all to do with political contests and which M. Dessoie, *rapporteur* of the Law of 12 July, 1919, called "obscure anxieties";
- (3) The possibility of a second election even falsifies the results of the first. A large number of electors, in fact, use the first ballot for manifestations of sympathy or personal rancour and wait until the second round to ex-

<sup>20</sup> In the election of 1945, 117 minority members were elected.

## IMPROVING DEMOCRATIC LEGISLATURES

press their political sentiments. Others, finally, give their votes to such and such a candidate, solely to produce another election; (4) The second ballot engenders a recrudescence of violence which is not calculated to heighten the morality of the election. Further, it is an extra source of expenses, and the prospect of a second round may suffice to keep out of the struggle candidates who are poor.

Now, some of these criticisms apply more particularly to France; not that they will not apply elsewhere, for every institution has its consequences, good and bad—but the intensity and quality vary in different human and organizational environments. Matters, for example, were particularly bad in France because of the weakness and multiplicity of parties and a tradition of electoral corruption—there is ample evidence of the unholy bargains produced, especially in the interval between the ballots. From France we have the phrase that the elected deputy is "the prisoner of the minority";<sup>25</sup> from Germany before 1919 the term *Kuhhandel*, cattle dealing, among the parties. Nor were, nor are, the arrangements made between the parties, before and during the elections, for mutual support at the first or second ballot, always kept. Who knows what emergency will arise in the space of four years to make it nationally impolitic as well as undesirable for the party that engagements should be kept? Nor is the location of responsibility clarified. The second ballot was indeed disturbing, since, in French conditions, it decides the complexion of the new chamber. These were the numbers of second balloting:

1899	.....	722	} in Assemblies of about 600 members. <sup>26</sup>
1896	.....	178	
1902	.....	174	
1906	.....	157	
1910	.....	227	
1914	.....	252	
1928	.....	425	
1932	.....	359	} in an Assembly of 465 members
1936	.....	424	
1958	.....	425	

<sup>25</sup> Cf. Bonnafous, *Le Scrutin d'Arrondissement et la Politique* (Paris, 1926).

<sup>26</sup> Cf. Georges La Chappelle, *Les Elections Legislatives* (Paris, 1924, 1928, 1932, and 1936).

To avoid the evils peculiar to a second ballot, the alternative vote was invented. In this system there is only one election, and the voter numbers his preferences at once, saying, in effect, "If my first-preference candidate does not succeed, then divide my second and third vote preferences among the top candidates." There are two ballots in one operation.<sup>27</sup> This, in fact, avoids the double expense and the double turmoil, but it does not get rid of interparty bargaining which occurs before the election. There is no doubt that the arrangement gives a peculiarly forceful position to the minorities, in the election as in the legislature: a direct product of the electoral method in combination with the existence of several independent parties determined to live in independence. Confusion in the executive begins with electoral confusion.

*Proportional Representation: Theory.* From the standpoint of exact representation alone, the systems already discussed may be improvements on the single-member constituency with relative majority, but they have still serious defects. (1) The actual majorities and minorities may still not be proportionately represented in the house; (2) certain small minorities may still not be represented at all. These criticisms have been urged by a long line of theorists and politicians without distinction of party, and their political import must not be underestimated. Nothing less than the authority of government is in question. At some junctures and in some legislatures a few votes may make all the difference, for years. It is of the greatest importance that no citizen should have sound reasons to believe that he is being commanded, perhaps coerced, it may be in most vital matters, by a minority. Hence the demand for mathematically exact representation of the electorate.

What does this involve? It involves always, whatever the diverse technicalities and whatever the size of the constituency, multiple-member constituencies. The number of seats available must be large enough to give to each coherent, well-

<sup>27</sup> Cf. Humphreys, *op. cit.*

knit group of voters with a faith sufficiently different from that of others the assurance of independent existence.<sup>28</sup> The number might be 5,000 or 10,000 or 30,000, or smaller or larger—how much it shall be must depend upon the total number of representatives which are considered to be sufficient, and not too many, to compose a technically convenient legislature. Only if there are constituencies with several seats can there be the independent representation of minorities and majorities—for it is obvious that one man cannot be all things to all men.

Now it is rare that a judgment of a system is formed by reference to a single merit or demerit, and so with the various arrangements for proportional representation. If there were no adverse consequences to count then we should say, "Representation means mathematically exact representation; the single-member constituency stands in the way; it must be abolished." Omelets cannot be had without the sacrifice of eggs. Is the omelet worth it? That is the question. It is urged by many students that the procedure involved in producing mathematically exact representation involves the loss of other very important qualities in government, and that this must be taken into account in a judgment of the system. The issues involved become most clear if we review two of the many varieties of proportional representation possible. I take first the system which actually operated for the German *Reichstag* from 1919 to 1933, and then the system instituted in Fourth Republic France.

*Proportional Representation in Weimar Germany.* The principle of proportional representation was laid down by the Weimar constitution, and special laws determined the details of the system.<sup>29</sup>

<sup>28</sup> For the case of proportional representation cf. Humphreys, *op. cit.* and *Practical Aspects of Electoral Reform* (London, 1922). Cf. also F. A. Hermens, *Democracy or Anarchy?* (Notre Dame, 1941); C. S. Hoag and S. H. Hallett, *Proportional Representation* (New York, 1937); and for theory and Irish practice, J. Hogan, *Election and Representation* (Dublin, 1945).

<sup>29</sup> Cf. article 22, and G. Kaisenberg, *Die Wahl zum Reichstag* (3rd edition), 1928.

The original arrangement was elaborated hurriedly in consequence of the sudden determination to hold elections for the Constituent Assembly of 1919. The impulse to proportional representation was immensely strong; it was compounded of devout worship of democracy by the revolutionary parties, belief that governmental justice was obtainable only by proportional representation, and the terrific reaction from the injustice of the old single-member, second-ballot system and the maldistribution of seats.

Broadly the characteristics were these:

The whole country with 65,000,000 inhabitants was divided into 35 constituencies (*Wahlbezirke*). (Great Britain, with 47,000,000 inhabitants, has about 610 constituencies.) The average size of a German constituency was 1,700,000 inhabitants, or about 1,150,000 registered voters. The largest was Württemberg, with a little over 2,500,000 inhabitants, and the smallest, East Hanover, with about 1,000,000. These constituencies were then further grouped into 16 conjoint constituencies (*Wahlverbände*); in some cases the original constituencies were left, in others two or three were combined. The average number of seats per constituency was eleven.

The parties established a list of candidates for each constituency. The characteristics of the list are important: parties were named on the list; this was not so originally, but by 1924 politicians had discovered that the names of the candidates were insufficient indication to the voters. In addition, on the ballot paper, each party was designated by a number, and this was determined by the strength of the party in the last *Reichstag*, e.g., the Social Democrats, List I.

(1) It was not compulsory to name more than four candidates; that is, after the first four candidates were named on each list, the voters might be confronted with and might vote a blank support to a party organization which had the power to fill the places to which it became entitled.

(2) The list in any one constituency could be joined with that of any other within the conjoint constituency upon

declaration, and this gave small parties the opportunity to combine their strengths by arrangement in different parts of the country. Thus there were large constituencies with your list of candidates, and the possibility of combining your list with that in a contiguous constituency.

(3) Each party established a list of candidates for the whole of the Reich (*Reichslist*).

(4) The electors had one vote each. They had to accept the whole list and nothing but the list, by marking across in a circle at the top of the list in the ballot paper, and the votes went to the list, not to separate candidates.

(5) For each 60,000 votes a party was entitled to one member: e.g., for 260,000 votes, there were four seats plus 20,000 surplus votes.

(6) Now, in a perfect system of proportional representation, such surplus votes, which might be as many as 59,999 in any constituency, must not be lost. Therefore all surplus votes were collected and aggregated within each of the sixteen conjoint constituencies, and, again, for each 60,000 of these the party got one more seat. But if the surplus in any constituency was not more than 30,000 or over, the surpluses were not counted. Finally, surpluses in the conjoint constituencies (and in single constituencies where the parties have declared for a direct transfer to the *Reichslist*) were swept together and ascribed to their *Reichslist* of candidates. Here, again, each block of 60,000 votes secured a candidate for the whole Reich. If after this division there were still surplus votes, then the fraction of 30,000 and over obtained one seat. There was one qualification: in order to avoid the fostering of small parties, no party could receive more members from its *Reichslist* than it obtained in the constituencies. For example, if a party had four members in the constituencies it could not have more than four from the Reich surplus. The system was almost perfect in its equity from the standpoint of a "snapshot," but not quite. For we must not forget that, though the intention

was to be absolutely equitable, small and scattered parties were deliberately put at a disadvantage to avoid the fragmentation of the party system and the consequent difficulties in forming stable coalition governments.

(7) There were no provisions for by-elections; therefore, when the ordinary lists were being drawn up by the party organizations, substitutes were added to provide for possible vacancies.

Thus the general characteristics of the system were: the largeness of the constituencies; the length of the lists; the combination and reward of the surpluses, particularly on the *Reichslist* (this, together with the ascription of seats to each 60,000 votes obtained, earned the system the title of "automatic system"); and the absence of by-elections.

Weimar Germany had eight elections under this system, on which important hypotheses may be based. Whereas there was a fervent belief in the system at the outset, within a decade there were serious doubts, and plans for reform before the *Reichstag*.

In judging an electoral system three main questions always arise: is it mathematically equitable? does it produce a wholesome contact between constituents and representatives? does it favor or jeopardize governmental stability? To the first the German answer is, "Yes"; to the second a decided, "No"; to the third, that it jeopardizes governmental stability. Upon what facts and reasoning are these answers returned?

The system tends to split up big parties and to encourage the formation and independence of separate groups. Before 1918 there were seven big parties in Weimar Germany; in 1932 over a score were electorally alive. The tendency was toward a further disintegration. How far was proportional representation, in fact, responsible? German social conditions, even apart from the electoral system, favored the creation of electoral parties, partly owing to the national genius for association, but largely owing to the full and sudden onset of democratic government with its fissiparous temptations, in

an age when the whole world was affected by a rather implacable division of economic and class interests. In England and in the United States, the party system preceded contemporary social and economic sectionalism, and still contains, though with enormous strain, the hostile elements.

Yet proportional representation itself positively contributes to the aggravation of successful sectionalism. In England a small party—for example, the United Empire party (1931)—would fail to secure a single seat and would either die out or make alliances. (So later with the Commonwealth party, a World War II mushroom.) With the German system, its surpluses over 30,000 in a constituency of, say 500,000 would be swept together, and the small party would receive seats. In Germany it was possible for the Christian and the atheistical peasantry to be separately organized; for the Catholic and the Protestant or atheistical artisan to be separately organized; for the large and small landowners to maintain separate groups; for the National Socialists to confront international socialists; for the Liberal party to lose, one by one, its constituent middle-class elements, which organized severally; for the Communist party to thrive under a rigid separation from democratic socialists.

The evil is grave, for two reasons: *First*, it makes more difficult the formation of governments, for by giving the groups independent strength in their own right, one more corporate conceit and resistance is fortified. *Second*, and perhaps of greater ultimate importance to society, is the driving of a number of nation-wide wedges deep into the body of the electorate, producing sections which it is important not to make hostile (as this does) but to integrate. A human tendency may be either promoted or counteracted by an institution. And the separatist mentality is promoted by the automatic-list system, and counteracted by the single-member majority system.

The list system causes vested interests to gain control of parties. Parties can calculate accurately, within a margin of

10 to 20 per cent, how many members will get in. In single-member constituencies they cannot: for that is a system of ever contingent electoral revulsion. Economic interests approach the party leaders and offer support of all kinds in return for the names on the list. This happens in all modern democracies, but it is easier to effectuate with the list system.

The central difficulty of the system is, of course, the large constituency and the long list, which inevitably throws into the hands of the parties, and more, the central council of the parties, the selection of candidates. It is even complained that the principle of direct election is infringed by the extent to which the parties intervene between the electors and the candidates. Further, if the party leaders settle the lists of names, they can demand unconditional allegiance from the successful candidates, and as a result the members' attention is turned always more to the party machine than to the constituency. Now, we have shown that in England also the parties are centralized and have a strong control over candidates, but there is always the chance that the candidate and the constituency may revolt. There is a rather subtle personal relationship between the member and the constituency which makes the dictatorship of party leaders effectively challengeable. A constituency may rather pride itself on the heterodoxy of a member above the average in ability; and at any rate the member has a definite circle of constituents to whom to appeal. In the German system, to whom could the heterodox appeal for support? He was one of a team, and was hand-picked.

Nor should we forget that whereas in England 640 local associations of each party participate in the choice of candidates, and in France 679 (1946), and in the United States 435 Congressional electoral districts, in Germany there were 35, or even less, centralized authorities for the choice and placing of candidates. Which system better promotes the real selection of a representative, or in other words, which is more representative? Further, a very large number of members

were not elected in the constituencies at all, but from the *Reichslist*, which was established by the central party organization. Thus about one sixth to one ninth of the total membership of the *Reichstag* came from the *Reichslist* in various elections.<sup>30</sup> In other words, in regard to a large number of candidates, those elected on the surpluses, the electors did not know at all for whom they were voting, nor in the end, who were elected.

In the place of a large number of personal contests, there are conflicts of national party programs; not that in the first case there is no reference to personal character and deviations from the program. However, there is a difference and its effects are variously valued. Some say that stable, unyielding party machines and programs fostered by the system are desirable. But the main, I believe the overwhelming, body of opinion considers the concentration of power in the party leaders and party officialdom a dangerous source of misrepresentation of the dynamic and inventive impulses of the party. After all, if local and sectional differences are made impossible within existing parties, an extra reason is supplied for the formation of new ones.

Further, the campaign becomes less intensive, and more extensive: that is, it does not occupy itself with the cultivation of the individual voter by personal appeals, but in the institution of monster demonstrations, like processions, in which the mechanical apparatus for making a noise or creating a diversion is predominant. It is argued that the system makes it impossible for new leaders to grow and take command of the party forces. (This is a direct corollary of the previous argument.) But this is already going too far; it did not prevent Hitler and Brüning from coming to the fore. Yet there is a better chance for technicians in Germany to enter Parliament, since it is possible to calculate pretty certainly on the capture of seats, especially on the *Reichslist*; but is that desirable?

Between 1924 and 1933 projects of reform were plentiful, for on the whole, Germany was profoundly dissatisfied with the consequences of the system. The Germans wanted the equity of the system but not a number of small parties, which endangered the stability of government. They wished to rid themselves of the machine character of the party and to establish a more living connection between the deputy and the constituency. The common suggestion is single-member constituencies. These constituencies would be grouped into about fifteen associated constituencies. Each member would fight alone in the single-member constituencies and if he got the quota (e.g., 60,000 votes) he would be elected. If more than the quota were obtained, the surplus would go to his party colleagues in other constituencies who would benefit in the order of the votes they themselves had earned. At this point the reformers parted company, some wishing to abolish the *Reichslist*, others to maintain it.

*Proportional Representation in Fourth Republic France.* The Fourth Republic has instituted proportional representation, not without much agony. None of the parties wished a return to the single-member constituency and the second ballot. All spoke of abstract electoral justice, but it is notable that each was spurred on by the advantages to it of proportional representation. The strongest advocates of it were the Communist party—to the point of establishing one single national list! They regarded the single-member constituency as an agency of unholy compromises, where the Right would vote for Communists and Communist votes might be used for Right-wing deputies. They were the most resolute opponents of the voters' exercise of a preferential choice among candidates—whether on national or departmental or more local lists—and above all, they resisted the proposal of the M.R.P. allowing the voter to write in candidates not in the list or split his ticket—called *panachage*. The big parties were prepared to be brutal at the expense of the weaker, like the Radical-Socialists and the Right-wing groups, by keeping them

<sup>30</sup> From *Hauptergebnisse der Wahlen zum Reichstag*, published by the *Deutsches Statistisches Amt* after each election.

off the slate unless they had lists in at least twenty departments, or by denying them the benefit of a share in the distribution of surplus votes above the quotas, when all gathered together, unless they had obtained over five per cent of the total votes cast at the election. These unjust proposals came to nothing.

The law of October 5, 1946, makes the departments the electoral constituencies, except that the six largest are each divided into a number of more conveniently-sized constituencies. Each party or other grouping puts up a list containing the number of candidates equalling the number of seats for the constituency. This number is settled in the law: the largest is ten candidates for Finistère with 483,000 registered voters, and the same for Gironde with 515,000 voters; the smallest the Basses Alpes, with two candidates and 56,000 voters—the others range between. No lists may be incomplete; no names may be written in by the electors; the candidates are put in the order of the party's preference and will be elected unless the voter states a preference, which he may do by writing in a preferential number on the ballot paper. The voter may vote only for one list. The seats are first distributed to each list of candidates according to the number of votes obtained by the list, divided by the average votes cast by the electorate per seat available. Then the seats in each list are divided in the order presented or according to the preference expressed. No provision is made for remainders to be nationally gathered and again divided, as was the case in the Weimar Republic.

It cannot be disputed that what led to this change in postwar France was a universal disgust with the single-member constituency, where electoral horse trading was promoted by the want of firm party organization and loyalty and was further aggravated by the second-ballot system in pursuit of an absolute majority for the winning candidate. However, a further extremely important motive was the feeling of each party that since it was not likely to win a majority by itself, which would have given it the single-handed control of the legislature and the executive (as is normally the case in England), it was just as well to compound for a system which would assure it of all the votes that it could muster as a minority.

For the certainty that it could not be ground down by the operation of the fortunes of nonproportional representation—even if by giving this up it lost some chance of being overrepresented—gave it a continuing strength in negotiation with other similarly placed parties in the formulation of the laws and the formation of cabinets. Proportional representation would enable them to harden their hearts. A cause of proportional representation, therefore, was the multiplicity of parties; and conversely, an effect of it is the further encouragement of such a multiplicity. No party was more coolly calculating in this debate than the Communist. If it were a majority, so much the better, power would follow numbers. If it were a minority, then polling all its strength and obtaining a proportionate number of deputies, it could not be left out of account in the process of government. And when the time came to establish the constitution, it used the common acceptance of proportional representation in the electoral process as an argument for carrying it through with relentless logic in the procedure of the Assembly, wherever power was located: for example, in the Assembly's presiding bureau.<sup>31</sup>

Straight P.R. did not last long, however. In 1951, the threat of the combined opposition of the gaullists (R.P.F.) and communists led center parties to adopt a mixed form of P.R., called *apparentement*. This included two different types of arrangements. *Firstly*, if in a constituency a party obtained more than 50 per cent of the votes, it got all the seats. *Secondly*, lists could declare, before polling day, that they were allied (*apparentées*): if they did so, they were counted as one list for the purpose of calculating an absolute majority and got all the seats at the expense of the other lists. Since center parties were politically in a position to ally themselves, while communists could not ally with the R.P.F., it was hoped that the center parties would be favoured; this hope was fulfilled, although much more in 1951 than in 1956. In the first of these two elections, the communists lost many seats. However, the system appeared unfair, and it came under attack from almost all parties—at least in principle—and it did not survive the fall of the Fourth Republic.

Of course, there is no such thing as

<sup>31</sup> Cf. p. 482 above.

## IMPROVING DEMOCRATIC LEGISLATURES

P.R. in the Soviet electoral system: winner takes all!

### DIRECT LEGISLATION

THE difficulties of representation have sometimes led to, among other things, the demand that parliamentary and party government shall be at least mitigated, if not displaced, by the direct action of the people.

*Its Varieties.* The maximum demand (as in the Bolshevik theory of government and that prevalent in some American states)<sup>32</sup> is for the right to elect and recall, at short intervals, all the elective officers of government, judicial and executive, except the legislative. In the French constitutional debates of 1946, the French Communist party expressed an inclination for recall of deputies, failing which the party claimed the right "on behalf of the people" to compel deputies in the party to resign from the Assembly. A more moderate demand is for direct legislation, that is, the initiative and the referendum. In both of these devices the people are formally called upon immediately, and not through the intervention of political parties, to record their votes on projects submitted to them. In the referendum, the legislature refers its work to the people for approval or disapproval. In other words, by the referendum, it is intended that the people shall have the opportunity of passing judgment upon a bill which has already been dealt with by the people they have elected; by the initiative, it is intended that they shall be able to introduce legislation which their elected representatives have not, for some reason, already handled.

*Its Advocates.* Now as soon as these institutions are examined, it will be seen that their merits are built upon real or presumed deficiencies in modern parliamentary systems.

(1) The arguments were most fully adumbrated, in relation to a practical con-

stitution, in the German Constitutional Assembly of 1919. Direct legislation was recommended to correct the internal difficulties of Parliament resulting from the fragmentation and uncompromising attitude of political parties. These difficulties of Parliament either produced unholy partisan arrangements, giving a majority to an accidental coalition, when the result ought to be referred to the people, or else prevented legislation from getting beyond the initial stages. In other words, the party system may be so lacking in suppleness that it splits up the general will, and the only way to retrieve the general will is to take the proposals directly to the people. The fear that a temporary majority will unfairly rush into legislation is very strong.

(2) Next, as in the example of the Australian constitution, direct legislation was recommended as a device for breaking a deadlock between the two chambers. This is an old, tarnished claim of the British House of Lords. It was, in fact, apart from the use of direct legislation in constitutional amendments, proposed by Preusz as the only occasion for the use of the referendum in the German constitution.

(3) Direct legislation was proposed as a corrective of the petrifying effects of proportional representation (a mistake and its corrective both together!), it being argued that the system used in Germany would promote the permanent reign of a number of party officials and the hierarchy of leaders. These might be stupid and ossified, and the means to make a fresh wind blow was a direct appeal to the people!

(4) Finally, conservative parties usually believe that direct legislation is, on the whole, conservative rather than progressive. What this means, and whether and why it is true or untrue, we explore presently (p. 564 ff.). Its converse is the Leninist-Stalinist argument that the people are not bold social reformers, and therefore a vanguard must pioneer for them and even over them!

It is already clear, however, that the discussion of direct legislation cannot take

<sup>32</sup> Cf. J. Q. Dealey, *The Growth of American State Constitutions* (Boston, 1915); and W. Brooke Graves, *American State Government* (New York, 1936).

place in a vacuum, but must be put into this context: whether, on the whole, the complex of representative institutions (the parties, the vocational and cultural groupings, etc.), which already produces a very close approximation of popular will and legislative result, can be improved by direct legislation.

*Existing Legal Arrangements For Direct Legislation.* Let us begin by observing the actual conditions prescribed for the exercise of direct legislation. Distinctions are made between constitutional, ordinary, and financial legislation. In most of the American states (but not in the federation),<sup>33</sup> in Switzerland,<sup>34</sup> and in Australia, a constitutional amendment must be compulsorily referred to the people for their direct vote. We have already explored the reasons for this: certain rights and obligations are considered to be so important that a change is made especially difficult. We also showed that the essential aimed at is care in the legislative process, and that this is produced by a compound of the actual electoral process, the quality of parties, the quality of the men and women in the parties, the nature of parlia-

mentary procedure, and the general probity of the civilization in which these function. There is no escape from the conclusion that whether or not a formal and compulsory referendum on constitutional amendments is desirable depends upon the combination and relative quality of these elements in different countries. In England as we have shown, the House of Lords, and the circles of whose minds it is a specimen, certainly believe in the desirability of such a referendum. Its formal introduction involves the duty of writing the constitution, and reforming the body which can demand such a referendum, as in Switzerland, where 50,000 votes may initiate amendments; so in many American states, and in Germany under the Weimar constitution.

On ordinary laws there is curiously no initiative in the federal authority of Switzerland, for most of the arguments which apply to the other forms of direct legislation would seem to apply to this: but the cantons have this form. However, the constitutional initiative is wide enough to include ordinary legislation when proposed as a constitutional amendment, and this, which is found in some states of the United States also, is a defect rather than a merit—to put ordinary laws into the constitution. Several states in the United States have the ordinary initiative, the practice having been begun in 1898. In the German constitution of 1919 the initiative on ordinary laws also appears. In America more states permit the initiated law to go to the people directly, than allow it to go indirectly through the legislature first, for the amendment or counterproposal. In America also, all the states having a constitutional initiative permit the direct placing of the amendment before the people. In the Swiss federation (and formerly in Weimar Germany) the proposal goes first to the legislature. The American practice of permitting direct proposition to the people has the serious potentiality of reducing the credit of the legislature and permitting badly drafted and unsound legislation.

In Switzerland, many American states, and Weimar Germany, laws already passed

<sup>33</sup> The account relating to the United States has been obtained from A. L. Lowell, *Public Opinion and Popular Government*, 2nd edition (New York, 1919); A. N. Holcombe, *State Government in the U.S.A.*, 3rd edition (New York, 1931); A. F. MacDonald, *American State Government* (New York, 1940); A. W. Bromage, *State Government and Administration* (New York, 1936). These books refer to the older treatises of Oberholtzer and others, which are, however, of small critical value. Cf. also V. O. Key and W. W. Crouch, *The Initiative and Referendum in California* (Berkeley, 1939); W. Schumacher, "Thirty Years of People's Rule in Oregon," *Political Science Quarterly*, June, 1932; J. K. Pollock, *The Initiative and Referendum in Michigan* (Ann Arbor, 1940); and particularly H. Gosnell and M. J. Schmidt, "Popular Law Making in the United States" (New York State Constitutional Convention Committee, 1938), Vol. 7.

<sup>34</sup> The account relating to Switzerland is from Lowell, *op. cit.*; Felix Bonjour, *Real Democracy in Operation* (London, 1922); L. C. Brooks, *Government and Politics in Switzerland* (New York, 1918), p. 134; W. E. Rappard, *The Government of Switzerland* (New York, 1936), p. 55 ff. and *La Constitution Fédérale de la Suisse* (Neuchâtel, 1948).

may be referred to the people upon petition of a certain number of voters. This is called the *optional referendum*. In all these cases, no distinction is made between one proposal or another according to their natural subject matter or according to the complexity or technical difficulty of the legislation. The ordinary conditions having been met, the people are sovereign, except in the cases where the result infringes a superior constitution, as in the United States, Switzerland, and Weimar Germany.<sup>35</sup>

However, in some cases direct legislation is subject to certain statutory or administrative limits. Thus, in the Swiss federation the referendum can be applied only to laws "and resolutions of general application and which are not of an urgent character." This clause has been interpreted as excluding treaties, the budget, and grants-in-aid for local improvements. A similar "urgency" clause is found in the American state constitutions:<sup>36</sup> in the German federal constitution and in the German state constitutions there are also similar exemptions.

Now, what is the inward significance of these limitations: urgency, general application, and finance? The makers and interpreters of constitutions have feared the ignorance or the selfishness of the voters. Have they had good reason for this fear? Experience shows that they have. The people have been irrational in regard to sanitary measures, on the grounds that their individual liberty will be limited; niggardly, and even spiteful, in relation to the salaries of public officers; inclined to get special advantages for their own locality without any account of the public cost; and steadily against the assumption of tax burdens although prepared to receive public benefits. Evidently the people needed assistance and leadership.

Let us consider the results of experience somewhat more closely, first in Switzerland and the American states and then in Weimar Germany.

*Direct Legislation in Switzerland and the American States.* Numerically, the opportunities of direct legislation have been amply used in Switzerland and the American states—in some American states too often for the peace of the electorate, its interest in the subject, and its capacity to discriminate and judge. In Switzerland the referenda from 1874 to 1939 showed the Swiss people to be anxious for liberal political rights, severe to murderers, unfriendly to the process of centralization, in favor of tariff duties, occasionally anti-Semitic, a drag on state activity in the control or management of industries, supporters of domestic virtue (in the marriage and liquor laws), steadily austere (especially in the cantons) in relation to the payment of public officials, and unenlightened regarding public-health measures. On the whole one may say the effect has been gradualist; or, in other words, the assemblies were ahead of the people. Moreover, the people have certainly not acted spontaneously, but have, in fact, been strongly incited and whipped up and informed by the same processes of electoral campaigning by political parties and ancillary organizations as we find in democracies without direct legislation. In the American states, direct legislation has fairly effectively coped with the organized spoliation of the public by industrial, commercial, and financial bandits, and has effected constitutional reorganizations. The technical subjects like administrative reforms or election procedure have called forth less response than moral issues like education, cruel sports, liquor. Apart from this, a generally conservative and parsimonious attitude was adopted both to proposals emanating from the legislature, and more so, naturally, to the groups of reformers who initiated proposals. Conservative treatment has been given appropriations for education, and proposals involving taxation, and the principles and machinery of taxation. The initiative has given a heaven-sent

<sup>35</sup> Equally in a state within the German *Reich*. Cf. F. Fleiner, *Schweizerisches Bundesstaatsrecht* (Tübingen, 1923), p. 274 ff; There is an edition of 1935.

<sup>36</sup> Cf. Lowell, *op. cit.*, p. 175: "Urgent for the public peace, health or safety." The power is freely used. Cf. also W. F. Dodd, *State Government* (New York, edition 1928), pp. 517-19.

opportunity to professional and manufacturing pressure groups to push proposals for their special advantage, while the citizens in general have not been impelled to initiate measures.

Now these very results might confirm the belief of some people in the virtue of the referendum at least. On what is this obvious conservatism based? It is due to the natural selfishness of the individual who can be made to bear a social burden only if he is thoroughly informed as to its meaning, its individual benefit to him as well as the social benefit—or, failing this, if he is either induced to trust certain leaders who can take a broader view than he (especially as the main burden will be not on the leader but on other people), or, again, if he is simply compelled by those who know better. Direct legislation places the weight upon the first of these factors.

But, as we have seen, the average elector is not highly educated or naturally apt to place confidence in education, so that unless there is a radical alteration of our present form of living and formal social education and culture, the making of law will be confided to people who cannot bear the burden. Forthwith they become the natural prey of political parties and pressure associations who, in most cases, think for them and force them into paths the character of which they cannot independently understand. We have already shown that some politicians succeed by window dressing and the offer of free pleasures and the pretense that there are no burdens to be borne. In most cases, that is, at the present stage of democratic development, unavoidable: otherwise the people would destroy themselves.

These considerations are borne out by observation of the actual voting in direct legislation both in Switzerland and the United States. Broadly these conclusions emerge: that the percentage of voters is small, the average being barely 50 per cent, this rising to as much as 70 per cent and 80 per cent in issues which stir the moral conventions or the property instinct, and falling, though rarely, to 20 per cent and lower where important but

technical issues relating to administration are involved; that the votes in direct legislation are most usually between 10 per cent and 20 per cent lower than those for candidates for legislative and administrative office; that the votes are often exceedingly close, and this, combined with the smallness of the total vote, often results in a change of the law by a minority of voters. It seems quite clear from the accumulated results in both countries that an extensive and real opinion prevails and can be expressed on the primary and elemental issues, such as are embodied in the Ten Commandments, but that they are clearly at sea as soon as they are asked to make judgments involving a careful process of going back to first principles. Not that the first class of subjects does not merit or require thought, but the prejudices about them are so widely shared and so intensely believed to be true that many people will vote, and decide.

The lessons taught by experience of the referendum and the initiative are reinforced by studies of those who habitually return an answer of "No opinion," or "Don't know," in public opinion polls.<sup>37</sup> It has been found that when specific information is called for—thus, knowledge of tax rules or labor statutes or the names of officials and ministers or the effects of a tariff—some thirty per cent declare ignorance. Where a definite attitude is asked—for example, toward Presidential or senatorial policy, or toward barring strikes in wartime—then about fifteen per cent betray ignorance. If men and women are questioned on broad policy—for example, whether lend-lease should be extended to allies, or whether a policy of neutrality is advisable or whether the United States should pursue a path of neutrality or enter into war—the ignorance or apathy drops to between six and nine per cent. Confronted, again, with a speculative question—such as whether the Soviet Union will fight against Japan when the European war is over, or

<sup>37</sup> See E. T. Britton, *The "No Opinion" Factor in Public Opinion Research* (unpublished thesis, University of Chicago, December, 1947).

whether the Senate will endorse the entrance of the United States into the United Nations—there is a marked increase of expressions of "Don't know": rising to thirty per cent in some cases, and hardly falling below fourteen per cent. Finally, where answers are solicited to general questions of morals, religion, and social intercourse—such as a belief in God or immortality, the faithfulness of husbands and wives, the propriety of antemarital sex relations, the regulation of liquor traffic, honesty of views between husband and wife—almost everybody has an opinion and expresses it: only about five per cent are silent.

Those who habitually have no opinion are Negroes, the lower economic groups, people with small education, women, persons over forty, the rural element, those dwelling in the South. It will be inferred that some of these groups have common characteristics; and again, they are at the same time nonvoters in primary and general elections.

When we ask then, what good has direct legislation done in the countries where it has been actually used, the answer must surely be that these countries, save for the combating of the dishonest "bosses" in the American states, are no better off and are probably worse off. This is certainly the opinion in America. The Swiss idealize their system more than the Americans, but when one examines their opinions they are seen to be of small substance. Consider the utterances of Bonjour: <sup>38</sup> "It is the surest method of discovering the wishes of the people—an excellent barometer of the political atmosphere." But we have seen that the people's wishes can be destructive, when the people have not met together to discuss the consequences of their activity and are not enlightened by those who are informed and wise. He proceeds: "It compels the legislator to conform with the aspirations of the people, if he does not wish the fruit of his labors to perish." But the legislator's fruits may be so good that they ought not to perish, and the aspirations of the peo-

ple many be uninformed, unintelligent and vindictive. "It puts an end to acute conflicts between people and governments, and provides one of the safest barriers there can be against revolutionary agitation." To this the answer is that the conflict is ended by brute force—that is a majority decision, which has in some cases been an exceedingly small majority, and sometimes a minority of the whole electorate. As for a barrier against revolutionary agitation, Bonjour himself says (though in regard to the initiative) that in the direct war-tax proposal "the Socialists made their appeal to the lowest instincts of human nature." Nowhere is there proof adduced that legislatures or parties are better or worse off since the introduction of direct legislation. It is highly probable when all is said and done that we will continue to emphasize the party system as a medium of government—especially for larger states with complex interests and greater difficulties for the propagandist. There may be an advantage in the initiative as a legal residuary instrument of correction against blocs and unrepresentative legislators—but how did they get there?

Let us now consider the special case of Weimar Germany.

*Direct Legislation in Weimar Germany.* Articles 72 to 76 <sup>39</sup> regulating the use of the initiative and the referendum, in some cases for ordinary laws and for constitutional amendments, were used several times, and were, in fact, a very mobile element in the constitution.

Let us first observe the German limitations on the initiative. (1) There were excluded certain subjects relating to finance. These limitations resulted from two motives: first, the conviction that the people could not know sufficient of law, administration, and public and private finance and economics to give a rational

<sup>39</sup> Cf. the commentaries on these articles in G. Anschütz, *Die Reichsverfassung* (Berlin, 1930); F. Poetzsch-Helfter, *Gesetz über den Volksentscheid*, June 27, 1921, etc. The best description and commentary is G. Kaisenberg, *Volksentscheid und Volksbegehren*, 2nd edition (Berlin, 1926).

<sup>38</sup> *Op. cit.*, p. 114.

decision on the subject; and second, the fear that the organized groups, either favorable or hostile to central and local civil servants, would too often attempt to upset the existing situation. The financial limitations were quite broadly interpreted in practice, as we shall see, and the broad interpretation finds a majority of defenders among lawyers.<sup>40</sup> In this interpretation it is interesting to find adduced the experience of various countries, and of England in particular, where the initiative in finance is either located in the government entirely, or where Parliament is subjected to severe limitations, and the considerations which there hold good certainly hold good of direct legislation *a fortiori*.

(2) The second class of limitations on the initiative comprehended the special majorities required. Thus: where a referendum was in challenge to a resolution of the *Reichstag*, a majority of the registered voters must have participated in the referendum (article 75); that is, the referendum has no force at all unless at least half the voters polled valid votes. The reason for this provision was obvious, when we remember American and Swiss experience. It gives rise, however, to the tactics during a referendum of telling those who are against a project simply to stay at home and not register their votes. Further, where, according to article 76, a referendum with the force of a constitutional amendment occurs, its acceptance by the majority of the registered voters was required. Thus those in its favor need over one half of all the registered voters positively for them. Again the tactics of the opposition is to tell voters to stay at home, and to argue that the initiated project is a constitutional amendment. What is a constitutional amendment has also been rather widely interpreted.

Until the advent of Hitler, there were

<sup>40</sup> Cf. the discussion by Carl Schmitt, *Volksentscheid und Volksbegehren* (Berlin, 1927). Naturally, they are not convinced of the legislative capacity of the people. This attitude is of a piece with their vindication of the right of the judiciary to review the acts of Parliament and the executive for their constitutionality. Cf. Chap. 9, p. 153 ff.

seven "popular" initiatives. Upon two only was the full procedure<sup>41</sup> carried out; the rest were abortive. The first, an abortive popular initiative, was that of the *Reich* Federation for Housing and Leaseholds "to amend the law on Housing." It was accepted by the government, but its promoters themselves dropped it.<sup>42</sup> The same association proceeded with a new proposal, and this was rejected by the government as a finance law. In April, 1926, the Association of Small Savers initiated an amendment of the Devaluation Laws. It was rejected by the government as a law affecting the budget. The government argued that "a law which materially amends the whole financial situation is inherently and without a doubt a law affecting the budget . . ." Schmitt<sup>43</sup> held that the term "law on the budget" properly refers to any law "the substance of which is by monetary measures to provide new income for the state's finances or to put new burdens upon it." In 1927 the *Reich* association of those injured by the devaluation of money<sup>44</sup> initiated a measure to return to the monetary valuations of debts, contracts, etc., before January, 1924. This was rejected by the government on the grounds that a finance law was involved.

The government's interpretation of the financial and constitutional nature of an initiative is final, the constitution having provided no other authority to decide this or to act as a court of appeal.

Two initiatives went through all prescribed stages: the referendum on the

<sup>41</sup> The procedure was provided in the Law Relating to the Referendum, for which see G. Kaisenberg, *op. cit.*, and the law relating to voting procedure at general elections; also, cf. F. Poetzsch-Heffter, *Jahrbuch des Öffentlichen Rechts* (Berlin, 1925).

<sup>42</sup> This led to the rule that after six months an abortive initiative lapses.

<sup>43</sup> *Op. cit.*

<sup>44</sup> Cf. F. Poetzsch-Heffter, *Jahrbuch des Öffentlichen Rechts*, 1929, p. 156. In the text I have omitted mention of the Communist party's initiative of October, 1928, demanding the cessation of work on the armored cruiser. It failed for lack of support in the preliminary stage.

expropriation of the princes, 1926.<sup>45</sup> and the referendum on the Young Plan of 1929, or, as it was cunningly termed by its promoters, the Freedom Law, or the Law to Prevent the Enslavement of the German People.

On the basis of Weimar German experience, we may answer several important questions:

(1) Is the vote on the referendum materially different from the distribution of votes as given to the political parties at the immediately preceding general election? It is not. In the election of December 1924, the Majority Socialists and Communists alone had together polled 10.5 million votes; these parties managed the referendum campaign, and the votes in its favor amounted to 14.5 million. In the second instance the general electoral vote and the referendum vote were even closer.

(2) Do the political parties keep out of the campaign? On the contrary. They enter with all their apparatus of propaganda, their appeals to party loyalty, and arguments which relate the proposition to the general policy of the party. In both cases where the referendum was carried through—the referendum on the expropriation of princes and the referendum on the Young Plan—two parties, the extremes on each wing, actually initiated the proposal. From the first moment each party declared its attitude and to the last advised and marshalled its rank and file. In the second instance the German National party was split by the action of the extremist Hugenberg: the Left wing of the party seceding on the ground that such extreme action tended to make impossible any governmental coalition between the party and other nonsocialist conservative groups.

(3) In what sense, then, is the initiative "popular"? In no sense different from the issues which are treated by the parties through the medium of the legislature and general elections.

(4) Was the issue "clear-cut" from all others? If so, the referendum is a useful

remedy against the alleged defect of representative government that it is based upon elections where the multiplicity of issues confuses the electorate and destroys the sense of the mandate. The issues here were certainly not clear-cut. They were made part and parcel of a general system of constitutionalism, the theory of private property and Socialist reconstruction, of international affairs and public finance as a whole. They were related to the programs and policies of the parties. The most significant example of this was the questionnaire put in the *Reichstag* speech by Dr. Curtius in defence of his government's refusal to accept the referendum project:<sup>46</sup> "If the proposal is accepted, what will be the next step? If such an alternative is accepted, what is the answer to the derivative questions which will arise as a consequence? At such a stage, what steps will be taken by the proposers?" He thereby showed that any government can take the responsibility for the proposal of a referendum only when its *sequelae* have been envisaged and sound answers provided to meet all the unavoidable and closely integrated consequences.

(5) How does the referendum affect the position of a government based on parliamentary responsibility? The government is seriously embarrassed and confused. Its program of legislative work is suddenly interrupted by the necessity of aiding or opposing an enormous agitation toward which, by the constitution, it is bound to state its attitude. Further, in a system based on coalitions of more than two parties, often precariously balanced, the result is, at the least, to heighten the instability of the government, and to cause confusion and personal and group collisions, which cost energy to try to overcome, often without success. The referendum has no pacifying effect: on the contrary it inflames antagonisms by reminding men of their existence.

(6) Did the referenda threaten the prestige of Parliament? The answer is,

<sup>46</sup> Speech, *Reichstag, Stenographische Bericht*, November 26, 1929.

<sup>45</sup> F. Poetzsch-Heffter, *loc. cit.*

decidedly! For one of the most effective weapons of the parties and committees is denunciation of the parliamentary system and that particular *Reichstag*. It is a body of talkers; it can come to no decision because of the fragmentation of parties; it is congested with legislative and administrative duties; it is unjust; it has no courage. The weapon was used without mercy.

(7) Were the referenda educational? Insofar as they meant extra campaigns of public speaking and a special overflow of printed discussion in newspaper and pamphlets, the answer is affirmative. But can we be so sure when we take into account the character of the propaganda? You either appeal to prejudice or you teach: if the former then there is no education, and in the instances confronting us there was an almost absolutely unbridled appeal to certain simple but powerful prejudices: property or not, a violent assertion of patriotism or not. Here are some of the titles of pamphlets in the princes' expropriation referendum of 1926: "Property is Theft!" "Five Hundred Years of Robbery by Princes!" "Not a penny to the Princes!" "Rich Princes, Poor People!" "Law or Robbery in the Republic?" In the second instance, the very name of the proposal, the "Freedom Law," and the "Law against the Enslavement of the German People" were irrational incitements. The proposers have every inducement to be virulent and unmeasured and nothing to restrain them like subsequently continuing legislative or executive responsibility. Ministers were subjected to the cruelest abuse, and being in office, were handicapped in their replies.

It must be admitted that the people learn something from every additional dose of propaganda, but the dose is at least as bad as it is good. Who will dare to say that in time they help the good and eject the bad? If we contrasted what actually occurred with real education, we should contrast two or three months' inflammatory and irresponsible demagoguery with a process which should last years—a process in which the proposal

would have been explained in all its parts to small groups of people of no more than twenty, and its connections with other parts of the existing body of laws and regulations carefully traced, its furthest ramifications and proximate and distant consequences weighed in terms of finance and subjective burdens placed upon various groups in the country and in foreign states, and the meaning of them all sedulously made clear. If education were the purpose, and a rational, considered, and sincere popular decision were required, these things would need to be fulfilled. In fact, they were not fulfilled. For the time was not available, and instead of the teachers who would have been needed, let us say about one in twenty of the voting population (that is, two million teachers), there were simply a few thousand party speakers, special associations like the "League for the Defence of the Seventh Commandment," and a handful of journalists. How many were made to realize that if they expropriated without compensation on this occasion rightly (let us say), they would have established a moral rule in the community not subject to careful discrimination when other groups were to be expropriated? How many were ever taught the results of attempting to force the hand of foreign governments by peremptory commands to one's own?

(8) Finally, the referendum gave to the discontented parties the chances of agitation, not only for something just, but out of malice, spite, and revenge for having suffered losses at the preceding elections and for their exclusion from the cabinet. If it is said that the referendum is proper in the third or fourth year of a legislature's life (and against that there is a great deal to be said), it must be observed that in Germany the referendum of 1926 was instituted by parties which failed at the elections of December, 1924 (in other words, the *Reichstag* had existed for only fourteen months when the referendum was proposed), while in the referendum of 1929 the *Reichstag* had sat for sixteen months and was again dis-

turbed by the extreme Right which had done badly in the election of 1928.<sup>47</sup>

The constitution of the U.S.S.R. empowers the Presidium on its own initiative or on demand of one of the Union Republics to conduct a referendum on proposed legislation (that is proposed by itself). The power has never been used; but Mr. Vyshinsky promises that *when* it is, it will not be in the corrupt bourgeois conditions of the lands beyond the pure pale (*op. cit.*, p. 335 ff.).

Such experience would, perhaps, warn us not to accept direct legislation as a remedy for the defects of parliamentary government. It improves nothing: neither the laws nor the people. It disturbs without providing solutions. It is an appeal from a court which has the makings and some of the equipment of a wise legislature, to all the crudities of a majority vote. Its operation leaves stark naked the physical power of numbers, surely not a desirable thing. The public cannot but be ignorant of the facts of the situation; the referendum campaign makes it no better, and it may make it worse, for many people are prepared to vote for what they immediately want without considering whether it is good for them or others in the long run. If, in spite of the teachings of experience, there are people who still say the will of the people ought to prevail, so it should. But let it not be pretended that this is the best medium through which it may do so. If what we have said about the process of govern-

ment in previous chapters is true, we should all be better served if our concern were fixed upon the reform of the party system; we should strive, then, to make the parties more responsible-minded, more sensitive, more masters of the social sciences. They would become conscious teachers, leaders, and trustees chosen for the qualities proper to such functions and for that of legislator. At any rate, the question of the referendum is the question of the quality of a country's political parties.

#### COMPULSORY VOTING

MANY people do not use their right to vote. Surveys show that in England the percentage of voters is about 75 per cent, sometimes a little more; in France recently about 80; in Germany about 75. In the United States about 70 per cent (in 1920 and 1924 there were low points of 60 per cent) vote in Presidential elections, while Congressional and state elections show, on the average, a worse record. (For the United States we must make allowance for Negro nonvoters in the South, who are excluded by fraud or force.)

*Causes of Nonvoting.* Why do not all the people vote? The reasons for nonvoting are inferable in two ways: first, one can examine into who are the nonvoters, and secondly, one can inquire of nonvoters why they do not vote. (It is also possible to interrogate them on their general character and interests, and make inferences.)

The first question has been answered in a variety of studies for the United States, and by the method of asking which groups of the population show the higher proportions of voting. Thus one study,<sup>48</sup> the results of which are corroborated closely

<sup>47</sup> On July 14, 1933, the Nazi government established its own referendum—without the popular initiative. It was used three times. The first was in November, 1933, to ratify the government's withdrawal from the League of Nations. The second was after the German-Austrian *Anschluss* in April, 1938 had been consummated. The third time was in August, 1934, when Hitler fused the posts of chancellor and president (on the death of Hindenberg) and the form of the question was "Do you German man or woman agree that . . . ?" There were overwhelming votes of "Yes," to Europe's ultimate damnation. This form of referendum cannot hoodwink anyone: its intention was not to derive authority from the people, but to boast that benevolent dictatorial authority was being used for their own good.

Anderson, *Ballots and the Democratic Class Structure* (Stanford, 1943), *passim*; Charles E. Merriam and Harold Gosnell, *American Party System* (New York, 1949); and McGraw-Hill (publishers) *Recent Social Trends*, Vol. II, p. 1507.

## COMPULSORY VOTING

enough by the rest, shows that the top quarter in the economic scale votes most, even when they have not had the highest education. Leaving economic welfare out of the question, the college people vote most, next the former high-school attendants, least of all those who do not attend beyond grade school. The older voters, those over 40, vote more than those between the ages of 21 and 39, in the ratio of 76 to 59. Among the workers, the voters in order of voting are white-collar workers, with farmers, manual laborers, and "service" occupations least of all. Recent arrivals in America vote more than do the persons of two and three generations settlement. Votes are highest in the great metropolitan areas and then trail down in the smaller ones, with the voting smallest in the rural areas. Of course, in general the Negro votes least of any group in the country: the reasons are obvious. Jews

and Catholics vote more than Protestant religious groups.

To the second type of question—asking the nonvoters why they do not vote—the best-formulated answer is that provided by Gosnell's study of nonvoting in Chicago.<sup>49</sup> The results are shown in Table 15. To make this study applicable to other countries would require considerable adjustment in the details and proportions, but its framework is representative of nonvoters everywhere.

There is no doubt that many of the answers Gosnell obtained were evasions designed to make the answerer less culpable than he or she was. For example, I should hazard the guess that 12.1 per cent is too high for illness. As Vauvenargues said: "Illness suspends all virtues and all

vices." Inertia provides for 44.3 per cent of the total, and perhaps this should be increased.

*The Compulsory Vote.* At any rate, is it worth while forcing all but the decrepit to vote? This is done in Belgium, Switzerland, and Australia.<sup>50</sup> In the first-named country the compulsory vote was introduced in 1893 when the suffrage was very widely extended. Until that time the results of voting under a limited franchise were on a par with those in England and France, but in the local government areas the results were disturbing. But it was argued that the comparatively heavier voting for the central legislature was obtained only at the cost of propaganda and discipline extremely expensive in energy and money.<sup>51</sup> The opposing theories were (a) that the vote was a civic "right" which the citizen might use or not, as he wished; and (b) that the vote was a "social right"—that is, a right to be exercised in the interests of society—and that therefore society might regulate its employment. The latter argument is analogous to the contention that the parliamentary privilege which protects a member of a legislature in the free expression of his opinions is not his alone but an attribute of the whole legislature, for its benefit and instrumental to its effectiveness. (We shall meet such arguments again: arguments which lead back to their proponents' ultimate metaphysics of society and which are not seldom at least a partial product of their material interests.) The strong practical reasons for the compulsory vote were the expense and difficulty suffered by the political parties in bringing the people to the poll. Moreover, the moderates were more afraid of electoral inertia than of the extremes: for the extreme voter would go to the poll voluntarily, not so the moderates. Thus, the Belgian voter is forced to vote, under penalty enforced by the justices of the peace. The fines are small, but they seem

to have been effective.<sup>52</sup> It is not surprising that the proportion of the electorate voting was always over 93 per cent (except in 1919, for which adequate extraneous reasons can be given). Excuses accepted are illness, absence abroad, absence for business; and not many are prosecuted compared with the total of nonvoters. In Switzerland some cantons have the compulsory vote, some not: in 1925 the cantons with it showed a poll of 86 per cent of the electorate, those without it only 72 per cent.<sup>53</sup>

In Australia, the Commonwealth Electoral Act of 1924<sup>54</sup> made it the duty of every elector to record his vote. Excuses may be made to the returning officers on a proper form which must be filled in by the nonvoter. The penalty for inexcusable nonvoting or nonjustification is between ten shillings and two pounds. The effect of the compulsion may be inferred from Table 16,<sup>55</sup> which shows very clearly the increase in voting after the passage of the Act of 1924.

And in every election for the House of Representatives and Senate, as well as

TABLE 16—AUSTRALIA: EFFECT ON NON-VOTING OF THE COMPULSORY VOTE ACT OF 1924

Election	Percentage of the Electorate Voting for	
	Senate	Representatives
1901	53.04	55.69
1917	77.69	78.3
1922	57.95	59.36
1925	91.31	91.39

<sup>52</sup> Cf. Harold Gosnell, *Why Europe Votes*, (Chicago, 1930), p. 103: The first nonexcused abstention was punished by a reprimand or a fine of from one to three francs. The second offense within six years was punishable by a fine of from three to twenty-five francs; the third offense within ten years by the same fine and public posting; and the fourth offense within fifteen years by disfranchisement for ten years in addition to a fine and public posting."

<sup>51</sup> J. Barthélemy, *L'Organisation du Suffrage* (Paris, 1920), p. 477 ff.

every referendum, since that time, something like 95 per cent of the electorate has voted.<sup>56</sup>

What motivated enactment of compulsory voting in Australia? Members of Parliament were disgusted by the abstentions. "Ever since the federation was established, of all those who have been returned to the Senate during the last twenty-four years, on only four occasions has an individual senator been returned by more than 50 per cent of the votes enrolled."<sup>57</sup> How, under such circumstances, could members speak in the name of democracy and the majority? It was believed that if voters were compelled to vote they could the more easily be made to acquire an informed interest in politics. It was urged that the State already spent large sums of money to enroll electors. Further: "If the people exhibit no interest in the selection of their representatives, it must necessarily follow, that in the course of time there must be a serious deterioration in the nature of the laws governing the social and economic development of this country . . ." <sup>58</sup> It was pointed out that Queensland, which established compulsory voting in 1915, managed to poll over 82 per cent of the electorate, while the rest of Australia polled about 55 per cent.

What does all this show? That it is possible to make people come to the polling booths and write a figure or make a cross on a piece of paper if they are threatened with the fine of a few shillings unless they do so. It enables the politician to say with conviction and demonstration that he represents a majority of the people. It makes it easier to get people to the poll. In some a political consciousness will be awakened. Notice, however, the substantial dangers: to vote under duress is no proof of the will to vote, capacity to vote, or right judgment. The politician may say he represents a majority of the people: but in fact, 30 per cent or more have

voted who do not care enough about politics to vote, let alone to inform themselves, except under duress. It is easier to get people to the poll. Is that for the good in politics? Is that not bound to make the task and therefore the efforts of political parties easier rather than harder? And there is a great deal to be said for imposing the greatest rather than the least strain on political parties. Finally, is it worth while to force a few into political paths at the cost of forcing the congenitally apathetic into giving an unavoidably ignorant and perhaps contemptibly cynical vote?

Gosnell <sup>59</sup> shows quite clearly that a high percentage of voters is, apart from compulsion, brought out by momentous issues, keenly contested and closely contested individual constituencies, and well-organized and active parties: thence comes the fullness of the sovereignty which is the prize of the victor.<sup>60</sup> He establishes some correlation between proportional representation and the size of the vote.<sup>61</sup> He shows also that there is more voting in urban than in rural communities; among skilled than unskilled workers.

Hence, when scholars like Barthélemy advocate the compulsory vote one is astounded at the argument:<sup>62</sup>

Abstentionism falsifies the sincerity of universal suffrage and prevents the normal operation of government by the majority; what becomes of representative government in a country where one third of the electors do not vote? The deputies—for we must take into account the votes obtained by the candidates who failed—do not represent the half of the electorate, and it is the half plus one of this

<sup>59</sup> *Why Europe Votes* (Chicago, 1930).

<sup>60</sup> Where there are constitutional limitations, as in the United States, interest and therefore voting tends to diminish. The same holds good, of course, of local government, which is severely limited government.

<sup>61</sup> Yet, says Gosnell (*op. cit.*, p. 183) regarding Germany: "It is true that the novelty of the system has now worn off and that its very stability has tended to lessen interest in voting, but the drop in the poll has been very slight."

<sup>62</sup> J. Barthélemy, *Rapport, Chambre des Députés, Le Vote Obligatoire* (1922), No. 4738, and *Droit Constitutionnel* (1926), p. 296 ff.

representation which governs the country. Forty million Frenchmen are subject to laws voted by the elected of two millions of citizens.<sup>63</sup> Under those conditions, the supposed national representation gravely risks being only a singularly unfaithful expression of the essential features of the nation. There is, further, a powerful interest in obtaining the votes of the mass of citizens who do not use the pointer of political passion. The obligatory vote brings to the polls the moderate voter, and favors the moderate parties which are often less well organized for the electoral struggle than the extreme parties.

Is this not a complete abdication of political science? The professor proceeds:

Once again, the obligation to vote is part and parcel of customs in Belgium; it produces no discontent there; it is an excellent means of civic education.

It is of outstanding interest in a theory of politics that the French Communist party was ferociously hostile to the proposal to institute the compulsory vote for elections in France. They wanted the votes

<sup>63</sup> Does he mean that if 70 per cent vote, then one half of this—or 35 per cent—of four million of the electorate (before women voted)—may rule, and that of this, only two million may represent the majority in the constituencies?

to go to the most eager and zealous organizers.

There is no help for representative government in devices like direct legislation or the compulsory vote. They either ascribe to the elector capacities which he does not and cannot possess, or else seek to overcome the alleged defects of political parties by obliging the citizen to undertake functions for which he has no interest or no aptitude. They ignore the unuttered lesson of the polls of public opinion in the United States, Great Britain, and France, that on every subject there are some 10, 15, even 20 per cent of those interrogated who "Don't know," which not infrequently means "Don't want to know." They forget the advantages of division of labor, and undervalue the numerous agencies of public opinion other than elections. They suffer, moreover, from the grave disadvantage of not concentrating the voters' attention on the conditions of improving the personnel, methods, and purposes of political parties. Hope lies not on these devices, but in the more adequate selection and education of candidates for office, and in the marked improvement of schools and adult education.

The heart of a statesman should be in his head.—N A P O L E O N

Those who are in the Ministry of State must imitate the stars, which, though the dogs bark, do not refrain from giving light or pursuing their course: such abuse should not be allowed to shake the Minister's probity, nor make him swerve from the resolute march towards the ends which he has proposed for the good of the State.—R I C H E L I E U

## *The British Cabinet and Its Auxiliaries*

IN pondering on the nature of executives, the student will do well to bear constantly in mind the characteristics of governmental leadership suggested earlier.<sup>1</sup> We have already indicated the principal parts of modern political machinery, namely: the electorate, the parties, Parliament, the cabinet, the chief of state, the civil service, and the judiciary. The middle terms—the cabinet and the chief of state together—comprise that which is usually called the executive. No deliberate philosophy on a single occasion distributed the work of government among its organs; these were made and endowed with power, each according to separate contingencies. Hence the executive comprises an assortment of functions which cannot be accurately inferred from the name, but can be known only by historic explanation and enumerative description. Indeed, all the executives have some legislative functions, even the American. And while in Continental parliamentary systems the executive is also the legislative leader, in the British system both the executive and the legislative functions are fully and inseparably blended in the cabinet.

The evolution of the executive need not occupy us long, for it has in many ways remained the residuary legatee in government after other claimants like Parliament and the law courts have taken their share, and we have indicated the history of the aggrandizement of these

authorities in other places. It is most useful to look upon the executive as the residuary legatee, for that explains the mixed nature of its functions and parts. In early times all power, of every kind, lay with the prince and his narrow circle of advisers or intimidators. It not only executed policy but planned it and sat in judgment.<sup>2</sup> The movement for responsible government caused portions of the power to be taken over by other institutions, the remainder itself being subjected to certain norms of constitutional morality and controlled by the new organs. The legislature, the courts, the people, the

Caldwell, *The Administrative Theories of Hamilton and Jefferson* (Chicago, 1944).

<sup>1</sup> Cf. p. 22 above.

parties grew to marvelous dimensions, yet they never denuded the executive (as the monarch and his ministers were called) clean of all but executive work. Even the fullest new modeling of government, that in the American states and federation at the end of the eighteenth century, established an executive which was more than a mere executive. And it is still anxiously debated whether the United States President is an executive compact only of the several definite powers assigned to him, or a more general executive with undefined residuary authority as well (like the European or British as Hamilton purposed). Even Montesquieu, as we saw, counseled no complete separation. Law-making was abstracted, but some law-making yet remained; justice was removed to a securer residence, yet large powers were reserved; control over the permanent officials was vested in the legislatures and courts too, yet not entirely; while the field of foreign relations has only in recent years shown signs of being relinquished by its ancient holder.

Now, the same tendencies which molded the executive in its modern form also caused the growth of a distinction between the chief of state (the King or the President or the Governor General) and the body of ministers or the cabinet, giving the former a principally decorative and symbolic position, which is combined with independence and permanence of tenure, while the cabinet has been made (and is) politically operative, reproachable, and removable, acting in fairly strict dependence on the elected legislature.<sup>3</sup> This is the council of ministers or the cabinet—sometimes also called the government or the administration, though these terms are a little wider than the former. Both these parts of the executive have important functions, and, though what holds good of one country does not exactly

hold good of others, of all save the United States this is clearly true: the most important political powers are exercised not by the chief of state but by the cabinet. Since this is so, and since it has a closer and more vital relationship to the electoral, deliberative, and controlling institutions which we have recently discussed, we treat of the cabinet first.

#### THE GENERAL CHARACTERISTICS OF THE CABINET SYSTEM

It need not be argued that the political characteristics we have described may be and are combined variously in different countries, even where the same terms are used to name a system which is believed to operate like the British model. In fact, as the course of the analysis will amply show, there are very significant differences of aspect and purpose. Broadly, however, there are certain common qualities and purposes which show themselves in the composition of cabinets and in their functions.

Cabinets are small bodies of men selected from among the leaders of the majority party or parties of the legislature, usually from members of that body, and holding office and exercising governmental power as long as, and in the measure which, the legislature permits. The people do not directly come into contact with the civil service nor does the legislature. The parties impel, but do not formally lead, the legislature. They employ a special agency, a trustee, a delegation from among themselves, to mediate for them. If we had not already in mind that etymologically a committee is an expressly selected and delegated body, we might call the British cabinet a committee of the legislature: it is that, except that the process of selection is not express choice by the legislature, and is indirect and complex, while the articles of delegation are rather vague and elastic.<sup>4</sup>

The members of such executive com-

<sup>3</sup> For the development of the system in the British Dominions see A. R. Keith, *Responsible Government in the Dominions* (Oxford, 1929), *The Government of the British Empire* (New York, 1935), and *The Constitutional Law of the Dominions* (London, 1933); and R. M. Dawson, *The Government of Canada* (Toronto, 1947).

<sup>4</sup> The French constitution of 1946 (article 45) is very strongly impregnated with the spirit of express legislative mastery over the Council of Ministers.

mittees man the departments of government each directing and controlling the everyday administration of one great branch of government activity. Collectively, they decide the execution of policy and the making of laws, the order in time of their items, how earnestly the tasks shall be undertaken, how much money shall be spent, and in what way the money shall be raised. This includes both foreign and domestic affairs. They explain to the legislature their motives, intentions, and reasons; they pilot their projects toward legislative acceptance; and they answer for the march of administration, which, by their acceptance of office is deemed theirs and only theirs. They are responsible; that is, it is acknowledged that blame and praise will attach to them according as—in the opinion of the legislature and the interested members of the electorate—they work woe or weal. The whole apparatus of government, every factor in the creation and execution of political decisions, revolves around them, concentrates upon them, radiates from them, though often not with frictionless celerity or to the universal satisfaction, and, normally, with much grinding and clanking. So powerful is this body, so busy, so ubiquitous, that the charge of tyranny is leveled at it, and gloomy prophecies are made about the decline of legislatures. We have yet to see how much there is in such charges and prophecies. But this is true, that the energizing, responsible center of government and ultimate decision is in the cabinet. Let us consider these matters more closely in regard to each country. When we do, we shall find that for various reasons, very potent in the past, but which may not persist always, the British cabinet system, the mother of all, is by far the most efficient.

#### THE CABINET IN BRITAIN

THE British cabinet consists not of all but only of the principal ministers of the Crown.<sup>5</sup> All the ministers, together with

the undersecretaries and parliamentary secretaries, form the "government" or the "administration." Which ministers are included in the term "principal" depends partly upon precedent and partly upon the convenience of each government. Also, the numbers vary within small limits, it being necessary to comprehend all the important branches, and to allow for committees of the cabinet to be formed without too much duplication of membership. An excess of numbers, however, causes the loss of the best psychological and physical conditions of effective deliberation. The number (about 20) is, of course, larger now than it was in the beginning or middle of the nineteenth century (9 or 11), because the state has a much wider sphere of activities.<sup>6</sup> The ministers of the Crown Act of 1937 defines "cabinet" ministers as those notified as being such in the *London Gazette*, the publicity daily of the state. Further, it seems to me that the variation regarding inclusion of the Postmaster General shows that importance is

---

by A. B. Keith), Vol. II ("The Crown," Part I), Chap. III; S. Low, *The Governance of England*, revised edition (London, 1915), p. 167; John Morley, *Notes on Politics and History* (London, 1914); Ivor Jennings, *Cabinet Government* (Cambridge, 1936).

<sup>6</sup> Cf. Sir Robert Peel, *Mirror of Parliament* (1835), p. 1797; cited in A. E. Todd, *Parliamentary Government* (Spencer Walpole edition, London), Vol. I, p. 283.

In 1948, following certain changes made at the end of 1947, the Labour cabinet consisted of only sixteen members. They were: Prime Minister and First Lord of the Treasury; the Lord President of the Council and Leader of the House of Commons; Secretary of State for Foreign Affairs; Chancellor of the Exchequer; Minister of Defence; Lord Privy Seal and Leader of the House of Lords; Lord Chancellor; Secretary of State for the Home Department; Secretary of State for the Colonies; Secretary of State for Commonwealth Relations; Secretary of State for Scotland; Minister of Labour and National Service; Minister of Health; Minister of Agriculture and Fisheries; Minister of Education; President of the Board of Trade. There were seventeen other ministers not in the cabinet. The student will notice that India no longer appears in the cabinet; and that owing to the establishment in 1947 of a Ministry of Defence, the Secretaries for War and Air and the First Lord of the Admiralty ceased to be cabinet posts—not necessarily forever.

<sup>5</sup> Cf. W. R. Anson, *Law and Custom of the Constitution*, 4th edition (Oxford, 1935, edited

partly defined with reference to the possible range and fluidity of policy. An office which like the Post Office has a rather limited range of controversial business and a vast scope of mere routine does not need the special attention of the cabinet. The same is now rather obvious of the Secretaries of War and Air, of Food, and Fuel and Power by contrast with the Minister of Defence, or the Ministers of Agriculture or Labour.

Ministers are ministers of the Crown, that is, they are formally appointed and dismissable by the Crown. But this action is hardly more than formal and symbolic, as we shall see more clearly later. The Crown appoints but does not choose; it dismisses but does not control; it acts on but does not determine the occasion of dismissal. For the power behind the throne is the authority of the people, to which government has been made responsible. The people almost exhaust their authority in the choice of Parliament and this body, to which a large sphere of sovereignty is ascribed by constitutional lawyers, applies the test of responsibility to ministers. But we have seen that people and Parliament are themselves organized and directed by political parties, and that it is difficult, indeed, to discover the distinct identity of these three bodies.<sup>7</sup> In the British system of government the trinity is an almost seamless unity.

This trinity cooperates by continuous interaction in the selection of the leaders of the party, and among them the prime leader. The Crown may, formally, choose anybody as chief minister, but government will cease if the choice made by the factors of popular control is flouted, because Parliament will not vote the laws or financial provision such a government requests and citizens might not obey or pay their taxes. Hence the Crown cannot avoid entrusting the formation of a government to their indubitable choice. I say indubitable, for if there is room for doubt, if there is an alternative, no rule exists,

either in statute or convention, to bind the Crown to choose one way rather than another, and a government must be formed by reference to the democratic practicability of the choice as viewed by the personal predilections of the king or queen.<sup>8</sup> Conditions have, since 1820, left little, though some occasional room for doubt as to who are the leaders of the parties, and therefore hardly any room for the personal choice of the sovereign. Before that time, there were hardly such agencies as political parties, but only fluctuating "connections" among leading families and the groups of interests attached to them. This situation, lending aid to special rivalries, together with the imperfectly acknowledged sovereignty of the people or even of Parliament, gave the Crown considerable latitude.<sup>9</sup> When factions and "connections" were transformed into parties, the division turned more upon the principles of government. Then, when government became actively lawmaking and socially ministrant, principles more and more settled party allegiance and singled out the man who best represented them.<sup>10</sup> When, finally, parties were consciously organized on a basis of dependence upon the people, they became the selective agents of leadership, and, providing they were not in doubt about who did and ought to lead them, the Crown could not be in doubt. In recent

<sup>8</sup> Cf. W. F. Buckle and G. E. Money Penny, *Life of Disraeli*, revised edition (London, 1929) 2 vols. (Note: Subsequent references to this work will be to the volume and chapter of the six-volume edition, page references will be from the new two-volume edition. All biographies frequently referred to will be indicated by their short title, omitting the author's name.)

<sup>9</sup> Cf. W. R. Anson, *op. cit.*, Vol. II, Part I.

<sup>10</sup> Yet the biographies of *Canning* (Stapleton), *Lyndhurst* (Martin), *Peel* (Parker) and *Disraeli* (Buckle and Money Penny, to 1860), among others, now reveal quite clearly how unsettled principles were, and more, how slight was the connection between particular leaders and those principles. Could that be otherwise when England so suddenly took the plunge into a steam-driven civilization? Peel's perplexity and the drama of his career seem to show that the new world came far too abruptly for men to realize its meaning until they had grappled with its problems for years.

<sup>7</sup> Cf. W. E. Gladstone, *Gleanings* (London, 1879), Vol. I, p. 224.

years the "machine" and the parliamentary members and their prominent men have determined these questions without the shadow of a doubt at special conferences.<sup>11</sup> Thus in 1922 the Conservative Carlton Club chose Stanley Baldwin to succeed Bonar Law; in 1937, Neville Chamberlain to succeed him; and in 1944, Winston Churchill became leader of the Conservatives at the invitation of Conservative party headquarters. In the Labour party, the body of Labour M.P.'s choose their leader; but his arrival among the few possibles is by election to high office in the party by the Annual Labour Conference. The development of the party caucus and conference has relieved the Crown of an onerous task of selection.

*The Prime Minister Makes His Cabinet.* Until recent years also the appointment of a prime minister was not a difficult problem, since not only was each party definite about which of its leaders should be called upon, but there were only two parties, one of which was necessarily in a majority. However, since three parties have arisen, owing to the growth of the Labour party and nondecease of the Liberal, the former simplicity was lost between 1923 and 1945. We shall also see later that Continental systems do not operate so simply, and their experience, which is now used as a warning in Great Britain, may one day be scanned as a necessary lesson. The prime minister thus indicated, is entrusted with the formation of a government. Under contemporary cir-

cumstances he does not refuse, because he need not. He is well aware of his strength, whether it is in numbers, as in majority parties, or in tactical situation, as in the minority Labour government of 1929. Until 1931 it had not been necessary for a British prime minister, in contemplating the possibility of office, to make a formal pact of coalition with other parties by way of an agreement either on policy or sharing offices, both a notable consequence of Continental conditions.<sup>12</sup> This, however, happened in 1931,<sup>13</sup> in the following circumstances.

In 1929, the elections returned 287 Labour members, 256 Conservative, and 59 Liberals. The Labour government being in a plurality, the King called in Mr. MacDonald, the Labour leader, to form a government. In the absence of an official union between the Conservatives and the Liberals the most likely viable government was Labour, and it must govern until it should find it impossible—when it might be replaced by a coalition of some kind, or might appeal for a dissolution in the hope of a clear majority. It was harassed by the double opposition and harrowed by the unemployment brought on by the Great Depression. Finally, the cabinet itself split on the problem of balancing the budget—whether to overcome the deficit by reducing unemployment benefits, or by raising taxation, or by acquiring more revenue by establishing a general tariff system for the first time in history. Mr. MacDonald deserted his Labour colleagues, and joined with Con-

<sup>11</sup> Cf. *Disraeli*, Vol. III, pp. 951-57: William Beresford (Conservative whip) to Lord Stanley, January 22, 1849: "I have discovered that the plan that they at present intend to adopt is not to propose D. as Leader in a general meeting of the Party, but being themselves organized to go down to the House, and for him thus backed to virtually undertake to be Leader, not by election, but *de facto*. . ."

Disraeli's leadership was treated as an accomplished fact in an official letter of the prime minister to the Queen (*Queen Victoria's Letters*, March 16, 1849), and further confirmed by the recognition of the whip and members of the government. "Thus, without any regular nomination or election, but by a natural evolutionary process, the lead of the Opposition passed to the fittest."

<sup>12</sup> This situation, however, pertained during the Crimean War, when Aberdeen's coalition cabinet was in office—from December, 1852, to February, 1855. Upon the resignation of the Aberdeen ministry, Palmerston attempted to reconstruct the coalition cabinet, but the Peelites (Graham, Gladstone and Sidney Herbert) resigned within less than a fortnight. Nevertheless, the period of political compromise ended only with the death of Palmerston in 1865.

<sup>13</sup> Cf. Herman Finer, *Future of Government* (London, 1946), p. 84 ff.; and see MacNeill L. Weir, *The Tragedy of Ramsay MacDonald* (London, 1938); Sidney Webb, *What Happened in 1931* (Fabian Tract, London, 1932); Philip Snowden, *Autobiography* (London, 1934), Vol. II, pp. 929-61.

servative and Liberal leaders to form a coalition government.

Critics of the Crown allege that the King had personally appealed to Mr. MacDonald to take this course. The truth is not known. Such critics think the King should have accepted the resignation of the Prime Minister and with it that of his cabinet, and then called for a dissolution. But suppose the outgoing Prime Minister had, after a conversation with the King not asked for dissolution? Was it for the King to decide that for himself? Or should he have then gone to the leader of the next largest party, the Conservative, and then, if they found government impossible (as they would because the Labour party alone could have outvoted it), called for a dissolution? Should this be done during such a crisis?

At any rate, the coalition government was formed. The government then took some urgent remedial measures, abandoned the gold standard (which the leaders had promised they would not do) and then dissolved. They went to the polls as a coalition. But their principles differed. They made an "agreement to differ," defended in the House of Commons by Mr. Baldwin as proper in the circumstances, and supported by his argument that the British constitution was very flexible and even vague, and that the people were not averse to trying a cabinet so heterogeneous.<sup>14</sup> Within a few months the system broke down, precisely because it ran counter to the spirit of the constitution, which above all requires clarity of principle and indubitability of responsibility. The followers of the parties in partnership became restive, and when the tariff issue was raised acutely, some of the Liberals and some of the Labour members seceded. The others who remained may well be regarded as having joined the Conservatives, the dominant party in the coalition.

The prime minister's choice of colleagues is not controlled by the Crown, though on rare occasions the personal aversion of the monarch has been the

means of keeping men out of office.<sup>15</sup> Fortunate is it, that the prime minister is unembarrassed by the personal wishes of the Crown, for his task is already formidable. The experience of a hundred and fifty years teaches us what an extraordinary combination of considerations dictates the composition of a cabinet. The prime minister seeks for ability in general counsel, for capacity to manage a department, for ideas and governmental initiative. These are not guaranteed by mere cleverness. For many other qualities distinguish men: industry, rapidity of intelligence, courage, a peaceful character which compels others to quiet consideration by its mere presence, sincerity—and the list is not exhausted. All these are required and the ideal cabinet is the one in which there happens to be the proper amalgamation of talent and character to serve the contemporary needs of the departments and the wants of the country.<sup>16</sup>

Today, the demands are far more exacting than at any previous time, for the amount and importance of governmental business is immense; the relationship of government to the economic and social pursuits of the country has become a blood relationship. The positive responsibility of the cabinet is passionately urged by almost every group and individual in the country, while criticism is continual and searching. Considerations of ability are important for the Chancellorship of the Exchequer only second to that of the prime minister. Is it not a remarkable illustration of the underlying impor-

<sup>15</sup> E. g., Queen Victoria "was a little shocked at Sir Charles Wood . . . designating the future *Government*, and selecting Lord George Bentinck, Mr. Disraeli (I) and Mr. Herries as the persons destined to hold *high offices* in the next Government" (*The Queen to Russell*, December 19, 1847). Cf. *Disraeli*, Vol. III, pp. 1165-66, and A. G. Gardiner, *Sir William Harcourt* (London, 1923), Vol. I, p. 464, on the Queen's dislike for Dilke; and S. Gwynn and G. M. Tuckwell, *Life of Sir Charles Dilke* (London, 1917), 2 vols., Vol. I, p. 303.

<sup>16</sup> Derby had to refuse because he could not rely on sufficient men of capacity. Cf. *Disraeli*, Vol. III, p. 1375 ff., and Queen Victoria's Letters (1st series), Vol. III, pp. 79, 80, Memorandum of January 31, 1855.

<sup>14</sup> Cf. Debates, February 8, 1932.

tance of economics and finance? (Perhaps another age may deem the Minister of Education or Religion, if there were one, second in importance only to the prime minister.) But the confidence of the City is necessary, even if, as since 1946, the cabinet's intentions are radically to reform the economic institutions of the country when City popularity, of course, could hardly be expected. But active hostility must be averted. Men with the quality of gifted organizers are needed, like Herbert Morrison, the "planner" in the cabinet of 1945.

Yet it is not upon capacity for the actual work of government alone that the prime minister may base his choice. Ministers must be good debaters in order to satisfy the House of Commons and the House of Lords that their admiration deserves the continuance of confidence. They must be able to deal with opposition criticism and, of quite as much importance, be good platform speakers and popular with the electorate. They must be on good terms with their own party. A party leader is entitled, in a democratic system, to believe that, be his cabinet never so bad, the curtailment of its life through lack of the arts of popularity will ultimately cause the country to suffer if the opposition is, as a sequel, called to form a government. There is the logic of the party system.

Then the question arises: shall all wings of the party be represented in the cabinet? Shall any attempt be made to include representatives of the various powerful industrial groups? This especially arises in Labour cabinets in England, since the trade-union groups are so large a part of the party; nor is it possible not to pay respect to those who have risen from social humbleness. In the Victorian age the problem was to include the castle and Vere de Vere,<sup>17</sup> later the great capitalistic interests; the problem now is to include and digest the factory and cottage as well as the politician by career, to the possible loss of aggregate efficiency. Another con-

sideration gives pause: how far shall heretical groups be included? Shall they be conciliated by inclusion or braved by exclusion for they have their following among the voters?<sup>18</sup> It depends upon the prime minister's temperament, the extent of the cleavage, the size of the dissentient minority, and the personalities of the prime minister's counselors and the leaders of the minority.<sup>19</sup>

The personal likes and dislikes of the prime minister have much weight. Former membership of a cabinet provides difficulties: an enemy will be made by exclusion; weakness may be the result of inclusion. But the prime minister is not a free agent. He has grown to leadership with others who are almost as good as he: in twenty or thirty years of common service in the same party and in the Commons, in opposition or in ministerial posts of varying rank. They have tested each other's strength and weakness, and all together have been tested by their opponents in years of debates, party conflict, and perhaps office.

Some of the men he is choosing are themselves possible substitutes, should something occur to prevent his own accession to office. He is no Caesar; he is not an unchallengeable oracle; his views are not dooms. He is always on sufferance and its terms are whether he can render indubitably useful service. At any time a rival may supplant him. The little group of leaders when in opposition are held together only loosely, and the conditions of their loyalty are not permanently fixed. Friendship, confidence, and policy suffer transformations. One or two or three who are needed by a potential prime minister

<sup>18</sup> "In 1846 the attempt to include the Peelites in Lord John Russell's Cabinet (formed 5 July) was frustrated by Peel himself" (Disraeli in a memorandum); the result was a purely Whig cabinet (*Disraeli*, Vol. III, Chap. I, p. 817). Cf. Spencer Walpole, *Lord John Russell* (London, 1889), Vol. I. So with the difficulties on the formation of the second Labour government in 1929—the Left-wingers were excluded by Mr. Ramsay MacDonald.

<sup>19</sup> In October, 1946 the Labour cabinet of 18 was composed of 3 teachers, 6 trade-union officials, 3 lawyers, 1 physician, 4 professional politicians, and 1 cooperative-society expert.

<sup>17</sup> Cf. *Disraeli*, p. 1160, on the formation of the Derby-Disraeli cabinet, 1852.

may make terms about themselves and others, in regard to office and to policy. There may even be stipulations regarding the nature of leadership. The interactions and the negotiations settle the terms of collegueship, the respective offices, and the nature, sometimes even the holder, of the prime ministership. But the indubitable prime minister—he who towers over his colleagues by reason of definite party selection, electoral popularity, character, and talent—has indeed a mighty power over the rest, for he has office to give. And only those who have seen the flushed faces, the anxious shuffling and nervous twitchings of the aspirants can know what a sovereign influence over men is thus exerted. When office is their life breath, we cannot be surprised that men pant for it: no spectacle of men in stress is pleasant. Thus, in the rather heated vagueness of an excited consciousness, do the prime minister and his colleagues associate in the formation of a cabinet, not without the frenetic advice and persuasion of unofficial tadpoles and tapers. The African jungle is not the only place where men do war dances and beat themselves into a frenzy in preparation for a kill. Salisbury was heard to say (from personal experience in forming a cabinet): "The Carlton Club resembles nothing so much at this moment as the Zoological Gardens at feeding time."

*The Implications of Responsible Government.* The principle of responsible government has certain institutional implications. The conventions of the cabinet system are: (1) that members of the cabinet are, as a rule, members of Parliament; (2) that they are necessarily members of the majority, whether of one party or of a coalition; (3) that they hold office only while Parliament and the country do not obviously withdraw their confidence from a minister or the entire cabinet; (4) that the cabinet acts as a unit in face of other governmental bodies, and this implies a certain predominance of the prime minister over his colleagues. We more closely investigate these implications *seriatim*.

Ministers are members of Parliament, that is, they are already elected or are

found a seat upon taking office. There have been no exceptions to this, except the apparent exceptions of abnormal times. Such was the case of General Smuts, who was made a member of the Imperial Cabinet in 1917; but the exceptional position is obvious—the normal peacetime cabinet system had been suspended, and the special substitute body adapted to the supreme political direction of World War I was called "cabinet" from habit. But when Ernest Bevin became Minister of Labour and National Service in 1940, he was not a member of Parliament: a constituency was soon found to elect him.

It is clear that the principle is not unintentional, and that it has certain valuable consequences. It was deliberately maintained despite the numerous Place Bills which were designed to exclude from the House those holding place under the Crown. Although it seemed obviously dangerous to an eighteenth-century assembly to risk the sapping tactics of the king's friends by their formally proper appearance on the floor and in the precincts of the House, there was something to be said in favor of the efficiency of a government that is the product of legislative and executive cooperation. Moreover, it often happens that to exclude your enemies is simply to create a rival in an unassailable place. To command them into your continual presence is to have them under a surveillance, which does more than surprise their intrigues, for it irresistibly insinuates itself into their habits of thought, and attends, spectre-like, even in their private councils. This is simply the institutional application of the psychological truth: "Out of sight, out of mind." Hence the principle of ministerial membership of Parliament in England was deliberately excepted from the eighteenth-century acts to exclude from Parliament those holding a place of profit under the Crown.<sup>20</sup>

<sup>20</sup> The Act of Settlement (1701), the chief instrument, provided the basis for admitting ministers to the House—though in itself it was a statute which limited the number to be admitted, it did not exclude all. So insistent

Where the principle has not remained, as in the United States, specially devised arrangements have had to be established to secure its manifest benefits. For those benefits are that the mind of the legislature may be made known directly to ministers, not only in set terms and in explicit detail, but also by the activity of that compelling emanation, the "sense of the House," which men like Peel, Disraeli, and Gladstone treated with such respect; and, reciprocally, the minister may answer in direct debate for his administration. Much may validly be learned of the intrinsic worth of a man from the direct and continual observation of his personal demeanor, his features, form, and gestures, and the prodigal indiscretions of his facial expression. The fact that he has been a member of Parliament for some years (sometimes as many as twenty) has already acquainted him with its manners and modes, and taught him a parliamentary tact and a respect for his former colleagues which makes for the smooth and honest working of the system. The courtesies which he as a private member desired and obtained from ministers he now gives. This is not to pretend that office does not create a gulf between ministers and others: there is a saying in France that there is a greater difference between a minister and a deputy than between deputies of opposed parties—but it is a bridged gulf, with easy and frequent communication.

The mutual accessibility of ministers and members is the essence of the system. It is only a minor disadvantage that it excludes from consideration for office any but members (or potential members) of Parliament, talented outsiders, and ex-

---

was Parliament on the responsibility of ministers that until 1919, when members became ministers their seat was automatically vacated, and they then had to seek re-election after new cabinets came into existence, except for the posts immune by old statutes. By the Re-election of Ministers Act, 1919, ministers appointed within nine months after a general election needed no re-election. In 1926 the provision regarding re-election was abolished.

On the general theme see Edmund Burke's *Thoughts on the Present Discontents*, 1770 (World's Classic edition, Oxford), Vol. II.

perts. A final judgment of the system obviously depends upon how far the Houses are a reservoir of talent, and how far the civil service comes to the aid of the cabinet with its technical assistance. Nor is the cabinet, or any minister, precluded from seeking advice wherever it may be found: they have their week ends and their Beveridges! (The Parliamentary Debates of 1943 contain the very instructive episode of the government's forbidding its civil servants from advising Sir William Beveridge in the preparation of his work, *Full Employment in a Free Society*.) A kind of sporadic and unofficial cooptation is always going on. In the election campaign of 1945 Mr. Churchill sought to scare the electorate with the bogey that some Labour ministers and a potential prime minister might have to answer for or take advice on policy from the executive committee of their party. He ignored the fact that the Conservative ministers and prime ministers regularly took counsel with their party and their friends outside Parliament.

*The Large Number of Ministerialists in Parliament.* The number of ministerialists in Parliament is necessarily high, for altogether they number about 35, and their undersecretaries and whips add another 40, while one cannot leave out of account the parliamentary private secretaries, another 35. The number is about 16 per cent of Parliament's membership, and 35 per cent of a party of, say 300 (but somewhat less when the number in the Lords is subtracted). It is a direct product of the large scope of state activity and the need each department has for a distribution of departmental and parliamentary work. But it causes the immobilization of an appreciable proportion of the House for the task of criticism, and the creation of a fairly solid block which is as anxious to maintain itself in office as to make a good use of its power. This is one among other reasons why the special function of criticism is concentrated in the official opposition. There is always quite a large and interested weight favorable to the suppression of opposition in one's own

party, for office may be too easily exalted above conscience, though, to the officeholder, it appears that office actually serves conscience. The only way out of this situation is to double the number of members of Parliament, a reform which we have already shown (p. 541) to be desirable on other accounts. Some attempt is made by law to restrict the number of ministerialists sitting in the House of Commons, and the intention of the act was to reduce executive influence upon it. But its method is antiquated, for it does not allow for the expansion of state activity and the increase of departments. The proper method is to reduce the proportion by increasing the total membership of the House.

The Report from the Select Committee on Offices or Places of Profit under the Crown, 1941 (no. 120), recommended that to maintain the independence of mind of the House of Commons, a conscious attempt should be made to limit the numbers of ministerialists in the House: the number of ministers would be limited to sixty (including undersecretaries), and the number of parliamentary private secretaries by a "convention" announced in a governmental statement of intention. This report was the result of an inquiry stimulated by an action of Mr. Churchill's. In 1941, Mr. Churchill insisted that Mr. Malcolm MacDonald should not be deprived of his seat in the House on being appointed High Commissioner of Canada. He even introduced a special bill to grant him immunity. The House was anxious for its independence. Therefore it undertook an inquiry into the history and present situation of membership of the House as affected by the holding of office. It recommended limitation of ministerialists to some 10 per cent of the membership of the House.

*The House of Lords as a Reservoir of Ministers.* The peculiar bicameral system of the British constitution has always dictated that some of the ministry shall be members of the House of Lords. Until 1867, when the constitution was a real if not a formal oligarchy, the cabinet included peers as of social, if not legal, right.

The question was, rather, how many commoners should be included. Since 1867, rapid evolution toward universal franchise, the rise of the party system, and the development of democratic sentiment have reversed this policy. The larger number of ministers are commoners, a very small number, peers; and though we may say that Conservative governments contain more peers, owing to the party's social predilections and the nobility's predilection for that party, other parties have come to regard this element from the strictly utilitarian standpoint of their talent, their money, their influence, and to arrange regular representation in a House which still has constitutional powers. This is specially true of the Labour party's connection with the House of Lords.

The number of peers in the Labour cabinet in 1948 was two, both of whom had been commoners and were created peers by the Labour government for its own representative purposes in the House of Lords. One was the Lord Chancellor.

*Political Unanimity of the Cabinet.* The cabinet is, of course, composed of members of the party or parties commanding a majority in the House of Commons. The magnificent qualities of the British cabinet system are the clear and immediate corollaries of the special qualities of the British political parties. In so far as the parties are unique, so is the cabinet system. And if the characteristics of the parties lead back to the material and spiritual history of the nation, and the tight smallness of the island and its geographic setting, then the cabinet's distinctive qualities lead back to these also. Other lands work under other conditions, as we have already to a large extent appreciated.

We have generalized the usually proclaimed principle that ministers must belong to the same party, by saying that they must belong to the party or parties commanding a majority in the House of Commons. The principle was proclaimed in the halcyon days when two parties seemed to rule the country, and when everything seemed to suggest that there

could never be more than two, even where strife and wild Irishmen abounded. Then, obviously, the principle of responsibility to the legislature meant the selection of the cabinet from the majority party. There was much less internal cohesion in nineteenth-century parties than later generations supposed, and often so much positive dissension that it was not seldom an impossibility to keep together as a government; and not infrequently some sort of coalition between wings and body supported a cabinet. But while the simple and happy external reign of two parties persisted—as it once again does, more clearly than ever—certain obvious governmental advantages resulted.<sup>21</sup>

These advantages were, for the electorate, a choice between two opponents and no more, and this, again, resulted in a fairly simple task of choice, and, for the cabinet, the possibility of unembarrassed leadership. A closer examination of each of these characteristics is important. We have already treated of parties in a democracy, and especially emphasized their organizing and educating functions: and a first judgment might be, the more parties the better. It is clear, however, that given the present quality of the average elector's education and native sagacity, the elector is hardly likely to be able to distinguish between more than two points of view on the same question, particularly

as this is sure to be exceedingly complicated and explained with evidence which, to a specialist, may seem crude and simple, but which to the common man seems exasperatingly subtle. Consider the criticisms of the jury system, where only one issue is before the court! Where there are many parties, they are obliged either to cease to explain in detail, because detail cannot be understood (and this is not good for the elector or for themselves) and rely upon exaggerations of principle uttered catchword-wise, or else to proceed with detail and confuse the voters' minds. Despite the doses of detail, it cannot be said that the electors have arrived closer to an independent and considered judgment than when only two alternatives faced them. Indeed, the reverse is truer. Issues may have been put in faulty generalization. But the competition between two parties brings out their implications. And finally, the House of Commons becomes the workshop of their application to the infinite varieties of the truth.

The party composition or the cabinet is even more important to sound governmental judgment and decision than it is to popular control. It is, indeed, an extraordinary proposition, at first sight, that ten or twelve or twenty men can sufficiently agree on every political problem to accept the principle of collective responsibility. Bagehot has said: "No two people agree in fifteen things; fifteen clever men never agreed in anything; yet they all defend them, argue for them, are responsible for them." The answer, however, is Gladstone's answer:

Rational cooperation in politics would be at an end, if no two men might act together, until they had satisfied themselves that in no possible circumstances could they be divided. [And again:] What are divisions in a cabinet? In my opinion, differences of views stated, and if need be argued, and then advisedly surrendered with a view to a common conclusion are not "divisions in a cabinet." There are, of course, many differences of view; but the question is, can the differences be accommodated? Obviously, the best condition of such accommodation is common allegiance to the same party.

<sup>21</sup> Because the government so clearly emanates from election and from the party organization which has organized for and fought the election, there has always been a close and intimate relationship between, on the one hand, Parliament and the cabinet, and on the other hand, the party leaders and the machines outside them. The former participate in the formulation of policy with the latter, and sometimes the personnel of each are identical; this can be seen from Keith Feiling's *Life of Neville Chamberlain* (London, 1946). It is surprising (except for the never-failing queeriness of electoral tactics) that Mr. Churchill should have tried to scare the electorate during the campaign of July, 1945, with the charge that the Labour leaders were responsible to an "unknown body"—the National Executive of the Labour party—to whom they could be required to divulge confidential information. Apart from errors of fact, this charge was an error of reasoning. Cf. *Report, Annual Conference, Labour party, 1946*, p. 5.

Though men and women often prefer the satisfaction of desires and ideas which directly benefit themselves more than others, there are loyalties and objectives which cause men to subordinate personal pride, acquisitiveness, jealousy, to the policy of a party. But only of their party, for it is by their voluntary choice that they are members, and, if it meant nothing to them, they would not follow it. Men and women flock to a party out of general instinctive bent towards it, together with strong social habit. It can be expected, therefore, that where a cabinet is simply the acknowledged group of leaders of a common party, the best psychological conditions for successful operation exist. The members are not without personal motives, but these are mitigated by deference to their fellowship in a party, and, if not to the merits of its immediate policy, at least to the danger of the conquest of power by the opposition. On the whole, the best interpretation—full faith and credit—not the worst—self-seeking—is placed upon the action of any member of the cabinet. Where, however, as on the Continent, several parties enter a coalition, the parties cannot avoid entertaining some suspicion of their colleagues. And since, further, their coalition is certain to come to an end one day, when, instead of being brothers-in-arms, they will be parliamentary and electoral opponents, they cannot avoid being continually on their guard against ruses, and ready with a challenge, nor ready to snatch some advantage for themselves, to the detriment of the national well-being as interpreted by the whole cabinet.

This brings us to the vital good in a cabinet system based upon a single party.<sup>22</sup> Somewhere in the state it is of sovereign necessity that there should be a forum where men may not only be absolutely frank with each other, but may be obliged to be frank with themselves. Its

members may be as frank as they like in discussion, and they will be heard and met with like frankness, for there is a principle of unity between them reliable, in the last resort, to hold the cabinet together, and its followers satisfied, even if there are some resignations. At least the trial of strength, and the contest of minds, take place in a broad-minded and sympathetic forum. Everything encourages creativeness, for the creator knows that he will not be killed without good cause. If there is an advantage, the party reaps its credit. Where parties enter a coalition, such complete frankness is impossible, for frankness often involves ridicule, the break-up of the cabinet, or the surrender of hostages to electoral opponents. Hence timidity, equivocation, and crises, and, where strong men meet, continual friction and public recriminations. Even where two hostile wings of an English party have met in a cabinet, these results occurred, with the addition that the balance of forces was every day shifted, and there was considerable secret diplomacy between meetings of the cabinet. In the interest of creativeness the most desirable basis for a cabinet is one party, and this is to be weighed heavily against other considerations which would produce government by coalitions—such as, perhaps P.R. and such as extremism of personal and sectional views.

Nor is this all. It is obvious that in all ordinary circumstances the British cabinet, which is based upon a single party, is necessarily sure of a majority for its proposals in Parliament. Once an electoral majority is obtained and the leaders have been almost automatically installed, the rank and file follow them. The severest difficulties and anxieties of the leaders are pre-electoral, not postelectoral, and once in office they may proceed with all dispatch and vigor, with, on the whole, very little to fear from defection. For the nature of the party system, and of the electorate, may condone and even applaud those who murmur against the leaders, and, generally, this is wholesome; but it will hardly countenance revolt more than once. The terms of a pact in a

<sup>22</sup> The "agreement to differ" of 1931, referred to above, p. 580, left a bad taste in everybody's mouth, and Mr. Snowden, on resignation from its restraints and subterfuges, publicly and venomously spewed it out! Cf. his *Autobiography* (London, 1934), Vol. II.

## THE CABINET IN BRITAIN

coalition government, however, can never be stated so precisely as to avoid quarrels about their meaning, nor can all men in each group be forever sworn to their leaders' bargain. Nor, finally, can a coalition government avoid surprises, and when they come there is immediate strain between the leaders and between these and their respective followers. The majority-party system encourages energy and decision, whether the policy is doing or not doing; the coalition system promotes timidity and vacillation, as we shall show in the section on France and Germany, and proved the death of democratic government in Italy, Spain, Poland, and Austria.

The experience of Great Britain in 1929-31 shows clearly the great advantage of the majority-party cabinet system by revealing the weakness of a cabinet founded upon a minority and dependent upon votes uncertain from day to day. The cabinet stumbled from one embarrassment and humiliation to another, and was unable to carry through legislation without mutilations and postponements. Recasting was disagreeable on account of the defeat of policy. To the electorate, the government appeared weak in intention, though, in fact, it was weak only in numbers and unable to control the time table of the House. With all the native energy and creativeness in the world, such a government is obliged to fall back on the defensive, and to eat the humble pie it had previously prepared for the opposition parties.<sup>23</sup> When a cabinet is split, or composed of a coalition, neither the electorate, nor even the skilled historian possessed of all the archives and memoirs, can discover who was really responsible for a

policy. Nor can the electorate ever know truly the proportion of responsibility for resultant policy borne by the government and a two-party opposition which marches into different lobbies at each division, not infrequently bifurcating.

The judgment of the body of electors on this situation is sound. It is adverse to the existence of more than two parties. We need not inquire how far this judgment is self-made, or how far it is uncritically tradition and the diffusion of the views of political leaders and publicists.

*The Confidence of the House of Commons.* The tenure of office by the cabinet depends upon its control over a majority of the House in matters which it holds to be vital. These must naturally be specific aspects of policy, legislative and administrative, and the cabinet's general repute and authority. When either of these is successfully challenged by an adverse majority, then it is obvious that ministers cannot go on—that is, if the adverse majority is really intent upon its course. For the machinery of government can be brought to a standstill by refusals to grant supplies and to renew annual legislation like the Army Act. But these sanctions are only the ultimate weapons of an outraged House, not the machinery and conventions which daily move the cabinet. The undue emphasis which Dicey has placed upon these sanctions ought to be modified, for the convention of dependence upon a majority is so well established and so permanent an ingredient of political mentality, that nothing else is likely to be needed save in revolutionary circumstances. To that point the convention has always operated quite successfully.

If cabinets were in office more for its sweets than for the fulfilment of policy, there might be a danger that they would flout the wishes of the Commons. But, in fact, policy has been a vital concern of governments, and any serious attack upon this or their general position has caused the resignation of one, or several, or all ministers. The methods of withdrawing confidence are by outvoting a governmental proposal or attacking a department, or accepting a vote of censure or no confi-

<sup>23</sup> Some Labour politicians vowed, as the result of this experience, never to form a government again, as a minority. Circumstances, apart from appetite for power, can be easily imagined where they would have disavowed the vow. This is, of course, entirely different from their entering the coalition under Mr. Churchill in May, 1940, and remaining until the end of World War II. Even then, many members of the party were restive under the political truce, which nevertheless was maintained, very honorably, by all parties to the bargain.

dence. The latter is, for the whole cabinet, more deliberate and deadly than the former. For, on the attack upon a special policy, minister or cabinet may concede a point which is not vital, or may quibble about the small margin by which it was defeated, or else—where the opposition is composed of two wings (whether parties or groups of a party, whose cooperation in a majority is casual and not likely to form the basis of an alternative government)—there may be occasion for doubt about the sense of the House. But a vote of censure is inescapable.

Is there, on the whole, and truly, much reality in the power of the House of Commons over a ministry? The power of the House itself existed only before the organization of the electorate by modern political parties, when the House was not so completely dependent upon the electorate. When parties were evenly balanced or split, and loyalty to a program and a leader were not so strictly the qualifications for candidature and election to the House, there were surprises and upsets in the division lobby supported by the fairly free groupment of malcontents with the regular opposition.

Since the rise of strong party organizations, the uncertainty of confidence and power has been removed from the House to the inner councils of the party. Differences cannot be settled by open secession, for the electoral penalty is apt to be very severe, or the threat of it is. At the most, the dissentients among the followers of the cabinet can ventilate their grievances in the House in order to frighten the government off its original and challenged course, as in the revolt of forty members against the Labour government's foreign policy in November, 1946, carried as far as debate, but concluded by their abstaining from a vote! Only in abnormal times are the parties likely to be really troubled by parliamentary secessions, when a sharp crisis afflicts the country and new paths have to be sought. Such was the vote of some forty Conservative members against Mr. Chamberlain on May 10, 1940, in passionate protest against his totally blind

war leadership.<sup>24</sup> He still had a majority, but his best followers had repudiated his conduct. He gave way to Mr. Churchill's war coalition.

For the rest, the settlement of such disputes (for example, within the Labour government in the fall of 1947 on whether the iron and steel industry should be nationalized and on whether the House of Lords should be reformed) is rather a domestic matter of the party, with the very remote possibility of an appeal to the House of Commons. This means that there is little or nothing to be feared by a cabinet which rests upon a single-party majority for its policy—that ministers individually, and the ministry as a unit, are safe. The cabinet may make concessions to their own party heretics, as of grace, but the House of Commons cannot compel the cabinet to an involuntary course. Further, votes of censure are no more than demonstrations to the public that some part, or the whole, of the opposition is carefully watching the government on behalf of the people. The term has the ring of doom in it, for "vote" sounds as though censure were already resolved and proven. It offers the opportunity on both sides for a full-dress debate: for the government certainly put all their goods into the window, and both sides attempt the highest number of votes that can be mustered. Every member of the House knows very well that the resolution is simply a feeling pretext for a debate and nothing more. Where a government is founded upon a minority of the House, the vote of censure necessarily takes on a more dangerous character. The niceties of a vote of censure mattered very much when the House of Commons was remote from the constituencies in publicity and there was no permanent organization linking it to its constituents, but since the almost definite settlement of policy and government at the polls, responsibility and confidence have become electoral, not parliamentary. Cabinet responsibility is plebiscitary, not representative, responsibility; the House

<sup>24</sup> Cf. Winston Churchill, *The Gathering Storm*, Vol. I, chapter 17 (New York, 1918).

has become the agent and mentor of the public, and rarely takes independent decisions. But it is a fierce watchdog that always glowers and growls, worries at the ministers' heels, and barks the alarm of "Strangers!" Once more we see how responsibility has been taken over by the political parties.

Lest any foreign observer mistake the nature of cabinet responsibility, and erroneously subscribe to the creed that the cabinet is not responsible, a few more words are necessary on this score.<sup>25</sup>

The cabinet cannot be turned out as a result of a Commons' vote of no confidence so long as it retains the support of its own rank and file. Does this mean that it has ceased to be "responsible" strictly to the House of Commons? Now, if responsibility means that the cabinet feels obliged to answer to the criticism and admonitions of the House, of the opposition, as well as its own party dissentients, then rigorous responsibility persists. For, as we have seen, the standing rules of the Commons, and certain strong conventions, guarantee to the critics the time and opportunity to challenge the cabinet's activity. Never a day goes by without this barrage flinging flame and lead at the cabinet. A vital factor in this process of discipline is that the nation is socially cohesive and territorially small enough for a fierce public light to beat continuously upon the central forum. The next election is always in the making; it is never out of sight, it is never out of mind. Both cabinet and opposition will have to appeal to the people for power; enough of the people and their mentors are on the doorstep watching the process inside the House. We have seen that the number of votes that separate the winner from the loser in the general election is small enough for future victory to be uncertain, for effort to reverse it to be encouraged,

and for struggles by the cabinet to avert a change in fortune to be compelling. Both sides therefore conduct constant maneuvers to raise themselves in the estimation of the public, and to discredit the other side. The voting figures in the House are secondary to the total cumulative effect of the record of both sides in action and argument. Even if present defeat is not turned into future victory and office, more votes and more seats have their influence upon the will of the government. A constant warning heard in the House is that the cabinet must not forget that nearly one half of the voters did not vote for it. This is an insistent menace. No government can ignore this fact; nor does it.

This process of argument, continued day by day and face to face, keeps the government responsible in policy and administration. Any mistake, any lack of feeling for legitimate and reasonable argument, may cost it public credit and seats.

Finally, the cabinet is not a thing apart from the rank and file of the House. Ministers are themselves rank and file. They are simply the leading members of Parliament of the party which is in the majority. They were nurtured in the House; their apprenticeship in that assembly was their testing and their selection ground. They think and speak and feel as members of the House. They are simply an extension—sometimes outside the House, with special responsibilities—of the membership of the House itself. Their responsibilities are not different in kind, whether legislative or executive, from those of their fellow members of the House. Both they and the rest of the membership of the House feel the same responsibilities, though in a different degree. Every member of the House feels that he is responsible for making statutes, and for executive policy, and for the good conduct of administration, in the same general character as does the member of the cabinet. No hiatus yawns black between them: they are members of one and the same body. Where the one ends and the other begins is not to be determined by any incision mark, still less by a cleft.

<sup>25</sup> I may say, in passing, that I have observed that a quite emotional nationalism still excites some political scientists, who seek to rebut criticisms of their own form of government by drawing wrong conclusions from their usually casual and surface observation of the operation of other systems.

Embracing them there is a seamless web. If these facts are ignored, then the British constitution cannot be understood, nor, *a fortiori*, can any system with which it is compared. The ignoring of these elementary phenomena has led to lamentable errors of emphasis in comparisons between American and British systems.<sup>26</sup>

If a decisive illustration were needed of the power of the House over the will of the cabinet, the reversal of the Labour government's current of emergency and planning policy in August of 1947, might be given.<sup>27</sup> The opposition had no chance at all by mere votes to deflect the cabinet from its path. But its continued, steady onslaught on the government's policies in finance, export, capital investment, labor, and wages, and its emphasis on the short-term rehabilitation problems as compared with Labour's long term planning policy, shook the government's own confidence and beliefs, and mobilized national opinion and focused its burning power on ministers. As a result, the cabinet was compelled to bring in a number of drastic immediate measures, to drop some ministers and appoint new ones, to reconstitute its own planning machinery, and to introduce a reign of enhanced austerity. The formidable impulse thus imparted by the opposition—not unwelcome by some members of the cabinet since it gave them a power by which to discipline the attitude of others in the cabinet—was of lasting effect. The promotion of Sir Stafford Cripps and the relative relegation of Hugh Dalton in November, 1947, flowed from the pressure of the Commons.

Apart from this, the student may very

well be amazed—if he accepts the view of those who disparage the controlling power of the House of Commons over the cabinet—at the fact that on the Coal Nationalization Act, the Transport Act, the Electricity Act, the Town and Country Planning Act, and the Agricultural Act, (that is, the main nationalization acts of 1946 and 1947), scores and even hundreds of amendments moved by the opposition were accepted by the government, though its votes, if it had insisted upon them, could have voted down any proffered amendments.

*The Prime Minister and His Colleagues.* It is an accepted generalization that the prime minister is *primus inter pares*, that is, first among equals. This rests upon the observed facts in most of the cabinets since Walpole's time, that one man is called upon by the Crown to form a cabinet, that he makes the ministry and distributes offices, presides over cabinet meetings, and that if he decides to resign for any reason of policy, as distinct from personal incapacity, the cabinet breaks up. No statute settles the status of the prime minister; his salary is still drawn in part as First Lord of the Treasury, an office bound up with the premiership since 1721. Only in 1906 was a formal position in the table of state precedence accorded to the office. And only in 1937, in the Ministers of the Crown Act, does the office appear in a statute, for there (clause 4) it is laid down simply that "there shall be paid to the person who is Prime Minister and First Lord of the Treasury an annual salary of ten thousand pounds." Indeed, the notion of a prime minister was not to the taste of the eighteenth-century Venetian aristocracy, who preferred to divide power locally into counties and centrally into cabinets of impotent mediocrities. The story of the challenge to Walpole's position, the first to be called "prime minister," is well known. The protest was one founded on personal and factional jealousy, and not on any impartial consideration of the relationship between the prime minister and his colleagues as it concerned the efficiency of government.

<sup>26</sup> Thus in the controversy between Don K. Price and Professor H. J. Laski in *Public Administration Review*, Autumn, 1943, p. 317 ff., and Autumn, 1944, p. 347 ff. and 360 ff. They have lunged past each other, fiercely stabbing what does not exist. See also the article on administrative responsibility by C. J. Friedrich in *Public Policy* (Harvard, 1941).

<sup>27</sup> See Herman Finer, "British Planning and Nationalisation," *International Labour Review*, March and April, 1948, and "British Central Planning Machinery," *Public Administration Review*, Autumn, 1948.

It is obvious that one man may stand out in importance above his colleagues in open competition with them in the political arena. It is just as obvious that unless one is given a formally prior status there must be an incessant competition for it *de facto*. But this is not a condition of efficient government once there is a fairly well-marked difference between rival parties and once responsibility to the people is in any degree acknowledged. For such competition is bound to split a cabinet into real, if veiled, factions, and to put a premium upon the separative forces whenever a difference of opinion arises. A symbol of unity and a practical guarantee of unity are necessary. Some one person must be given a formal predominance which, in itself, will overcome the acerbity or intolerance of private opinions in the cabinet. To rely upon the personal popularity and talent of the man would make the office an object of ambition and a source of contention. No form of government has been able to avoid this conclusion. Not all politicians are willing to admit its necessity. But however it is hidden or counteracted or denied, it exists. A symbol and instrument of unity in the cabinet is necessary: something which shall prevent waste of effort and competitive friction, secure regularity in leadership, and avoid indecision. To achieve this in practice, one minister has been given the prime ministership. In Britain this has come about empirically, and the results are embodied in not very definite conventions. In other countries, British experience has furnished the basis for an attempt at written definition. In Britain the pre-eminence of the prime minister is shown and is secured by (1) the chairmanship of the cabinet, (2) the leadership of Parliament, (3) his position as chief channel of communication with the Crown on general policy, and (4) his acknowledged position in the country as leader of the party and the embodiment of the highest political power.

It is, of course, obvious that an incapable prime minister may ruin his conventional position. Sometimes (like Peel,

Disraeli, Gladstone, Lloyd George, or Churchill) he so far towers above his colleagues that he could dispense with the artificial support of convention without disadvantage to government; sometimes (like Addington, Portland, Goderich, Melbourne, and perhaps Baldwin) he is so weak that without this authority he would be impotent. How can the latter contingency possibly arise? It may arise when death or a sudden political crisis results in the rather abrupt realignment of parties and colleagues, so that the prime minister from a previous dispensation is surrounded by ministers whose cooperation with him, and among themselves, is untried and incalculable. Nor is political judgment finite; it may always be modified by some new event revealing more clearly, and comparing, the character and strength of men. Sometimes, then, the prime minister is a weak plaything of the rest of the cabinet; sometimes he is a superior, cooperating, colleague; sometimes, when danger and character combine, he is close to being a dictator—on sufferance and with a limited term.

Even as the prime minister makes his cabinet, so he has the power to unmake it, by resignation or forcing individual resignations. He may even counsel dissolutions to achieve this. According to Lord Oxford and Asquith, the prime minister always submitted the question of dissolution to the cabinet for ultimate decision.<sup>28</sup> But this was not followed by Mr. Baldwin in 1923 or 1935, nor by Mr. Churchill in May of 1945. Ramsay MacDonald's use of this power in 1931 caused the Labour party executive to frame rules to control the action of the leader in regard to his cabinet. He would be required to consult a committee of three persons appointed by the parliamentary Labour party (the members in Parliament) in the formation of a cabinet; he would be subject to majority decisions in the cabinet; and he would recommend dissolution only after decision of the cabinet confirmed at a

<sup>28</sup> Lord Oxford and Asquith *Fifty Years of Parliament* (London, 1926), Vol. I, p. 194.

meeting of the parliamentary Labour party.<sup>29</sup>

Against the governmental advantages which issue from the existence of the prime ministership, certain disadvantages must be noticed. The prestige attaching to the office may on occasion result in an undue demand for deference to the opinion of the man, and too narrow a view of the extent of loyalty to be expected from ministers, so that independent views and ideas are forbidden. This has occasioned much distress to some cabinets, and it has occasionally deprived the country of the benefits of collective wisdom. The Baldwin cabinet of 1924 to 1929, the MacDonald cabinet of 1929 to 1931, the Chamberlain cabinet of 1937 to 1940 are cases in point. The ideal prime minister would put into the common stock his own real individual inventiveness and feeling, without forcing the situation by appeal to his formal superiority, and would use his position in the last resort, no more than to avert an actual split, so that the diverse views on the public good should be fully and maturely weighed against each other and the contingency which they are to meet.

Let us consider the significance of the facts about the prime minister's positions of power. (1) The prime minister is chairman of the cabinet, unless prevented by illness or by other engagements. There was a time when the king presided. But this appears to have stopped when ministers in the reign of George I made their resolutions privately before the cabinet meeting, no doubt because at certain points they were collectively hostile to the political pretensions of the Crown, and perhaps because a spiritual gulf developed between Englishmen and the alien king still connected with the state of Hanover. The king enjoyed his mistresses; his ministers enjoyed becoming masters. It is well known that in England and the Anglo-Saxon countries generally, the chairman of any committee attracts a special kind of loyalty, engendered by the

vague feeling that business is expedited and improved by order and that one must be prepared to suffer the chairman's ruling for the sake of the collective enterprise. A casting vote is usually inherent in the chairman: that in itself gives authority, though it should be noted that the cabinet does not take decisions by vote. The popular phrase, the "chair," indicates quite clearly, however, that loyalty is extended not to the incumbent but to an impersonal thing which embodies functional rules. It is clear that the prime minister is at an advantage.

(2) The prime minister is leader of Parliament, nowadays, invariably, leader of the House of Commons. This means that the principal announcements of policy and business are made by the prime minister, that questions on nondepartmental affairs, and upon critical issues, are addressed to the prime minister. (He may be closely assisted—as, in the Labour government of 1945, Mr. Attlee was assisted by Herbert Morrison as "Leader of the House of Commons.") The prime minister is recognized in the Commons to have an immediate authority to correct what he considers to be errors inferrable from any of his colleagues' statements, whether in or out of the House. No cabinet minister would consider he had such a right of correction or reprimand concerning any of his colleagues or the prime minister, but the prime minister exercises such a power, and no one says him nay; on the contrary, the power is considered a right. Generally, the House looks to the prime minister as the ultimate oracle in the matters of doubt where ministers do not give it satisfaction, and as the fountain of policy.

(3) The prime minister is the chief channel of communication with the Crown on matters of public concern; but he is not always only a channel, for we have seen too many examples of the Crown's connection with individual ministers behind the back of the prime minister. What is meant is that the reports of the cabinet councils are made by the prime minister, and that this account is not revised by his colleagues, and that, in emergencies,

<sup>29</sup> Cf. *Annual Conference, Report, 1932* and 1933.

## CABINET RESPONSIBILITY

the Crown will first consult the prime minister.

(4) Most important of all, however, is the position of supremacy which the prime minister possesses from being chief of his party. Since William Pitt's time, the interval between a man's entry in Parliament and his accession to prime ministership has only on one occasion been less than thirteen years, and it has more often than not been over twenty-five. No colleague can dispute the significance of this, nor alter the terms of that leadership without either an appeal to the party or such conspicuous merit that the party itself initiates a reform movement in his favor. But this would take years of effort against all the latent sentiment of loyalty which has been created and stored to support the prime minister, a complex of feelings and ideas resulting in such inertia that a leader cannot be dislodged: he goes only when he removes himself by sickness or age (Baldwin, 1937), or flagrant incompetence (Chamberlain, 1940). The tendency is to support the leader against his colleagues, unless there is such scandalous ineptitude that it cannot be hidden even from the stupidest of voters, or unless, as in 1931, a contingency occurs upon which the minister remains in office while a large number of his cabinet secede owing to radical differences of policy. But this point is rarely reached in the modern state. No one knows, and no one cares, where other ministers dwell, but the innocent of innocents knows the meaning of 10 Downing Street. Consequently the prime minister has tremendous authority over his colleagues. They are, in detail, severally answerable to him, the embodiment of cabinet unity and supremacy. This it is which makes a cabinet to be the prime minister's cabinet, and gives him authority which may, if he wishes, undo a majority vote of the cabinet against him; for, finding himself in a minority, he may threaten resignation which will extinguish the adverse majority by extinguishing the cabinet. Moreover, the prime minister was *ex officio* chairman of the Committee of Imperial Defense and at Imperial Conferences. It is of interest to note that in

the account of the cabinet given in Gladstone's *Gleanings*, published in September, 1878, the prime minister's position as head of the party is ignored; the gulf between that time and this is as wide as the great party organizations and the franchise which have grown so extensive since 1880. The cabinet, thus composed, is admirably appropriate to its functions, simply because its functional development has by gradual stages governed the nature of its composition.

Once again, it is here necessary to utter a warning, that the status of prime minister must not be thought of as involving his superiority to and independence of his cabinet. The desire on the part of some students to glorify the office of the President of the United States, to give its leadership justification, has caused them, unwarrantably, to point to the prime minister and urge that he stands high above and aloof from his colleagues, giving them orders and deciding "top policy" while they become subordinated into something like the political heads of departments in the United States government. The thought is ridiculous: it is wishful thinking: it is misleading for Britain and for the United States. The prime minister is solid with his colleagues; the party has cemented them together as a multiple but a corporate executive.

## CABINET RESPONSIBILITY

IMPORTANT above all is the concentration of responsibility in the cabinet—responsibility for the continuous management of affairs. This responsibility was once toward the Crown; then it became divided between the Crown and Parliament; after 1832 it inclined much more toward Parliament than toward the Crown; since 1867, it is to Parliament tempered by daily regard to electoral and party opinion. Indeed, the electorate and the parties are organized to exact this regard, so that although the formal public arena of answerability is the House of Commons, the questions and the answers are always molded with conscious and necessary reference to the constituent bodies outside it.

Now, the existing treatises on the British constitution insist that the cabinet is responsible in two senses: that every minister is responsible individually for the work of his department, and that ministers are responsible as a body for each department and for general policy. This convention involves the need of explaining its practical daily operation, and what we are to understand by "responsibility." The convention means, in the first place, that certain work is definitely devolved to a known body of men and women, and that thereby each minister is made responsible for a single department of state, while being a member of a body which collectively acknowledges that it is answerable for all administration and policy. Each minister becomes the supreme ruler of a department. He may, if he wishes and if he can, do all the work of that department. But he finds that he cannot do more than generally direct the chief permanent officials in the few critically important matters of high administration, and elaborate, with their constant cooperation and counsel, policies for his branch of the national life. This is, in our own day, a tremendous task, and can be accomplished only by the aid of the civil service, which serves ministers of any party impartially. The minister's task is, on the departmental side, one of stimulus and direction; on the parliamentary and electoral side, advocacy and defense of what he and his colleagues are doing, and, as long as they are in office, they and they alone are assumed to be doing all that which is, in fact, being done. From the standpoint of Parliament and the people, the minister is the department; behind him stands an office, with an address, enclosing a vast reverberating vacuum, and this vacuum is created by the principle of civil service anonymity. The fiction is consciously preserved so that the keen searchlight of criticism shall travel swift and straight, and not be refracted by passage through the medium of the bureaucracy about which Parliament and the public cannot learn very much. The minister is liable for an almost instant answer regarding any of the millions of incidents which

may occur in his relations with foreign states, or in all his own counties, towns, districts, parishes, regarding the claims and accidents of the most insignificant individuals, regarding even, let us say, the improper official execution of a diseased cow—he is answerable for all men, animals, things, and natural phenomena, within the purview of his office. He must satisfy the House: and should he not do so, he may be compelled to resign, if the matter is sufficiently grave, having regard to the whole political situation.

What does this last proviso mean? It means that a minister who is regarded as incompetent by the House may be forced to amend his ways by the fear that his colleagues will consider him individually culpable and too incompetent to warrant their intercession. Thus Mr. Shinwell in 1948 was demoted from the cabinet as Minister of Fuel and Power to Secretary of War, because he was too powerful an irritant to the opposition. This decision in any case depends upon the situation of the country and the cabinet's view of the gravity of the offense, and the importance of the man and the deed in the context of their general policy and reputation. On the whole, the Chancellor of the Exchequer and the Foreign Secretary may be said to be exempt from the fear of individual fall, though not of responsibility, because their offices are such important parts of the general policy of the government that its joint fall would almost certainly follow upon their defeat. And yet in December, 1935, the Foreign Secretary, then Sir Samuel Hoare, was dropped—made a scapegoat—in response to a storm in the Commons and the country. Also in 1935, the House made a minister recede on his unemployment regulations, and in 1940 on the wartime restriction of civil liberties. During World War II many individual ministers were dropped after Commons' criticism. And in November, 1947, for the simple and innocent indiscretion of informing a parliamentary journalist of the contents of his budget speech in the lobby of the House and immediately prior to the speech, which details were published in the newspaper

before they were told to the House of Commons, one of the ablest Chancellors of this generation, Mr. Dalton, was compelled forthwith to resign from the government. As his prime minister said, "The Chancellor of the Exchequer must be above suspicion in the matter of his discretion."

*The Consolidation of Cabinet Business.*

As a matter of fact, it is rather difficult to fasten any but the blame for quite small and routine departmental matters upon a single minister without involving the whole of the cabinet. Just as local government has become integrated with the work of the central authority, so that to-day there is hardly any real localization of an important subject of government. And just as there is an enormous and ever-growing integration between individual and governmental enterprise, so have all the individual departments of government become articulated. Fiscal policy unites them all: the economic and social planning activities of the state are impossible without a consciously and densely interwoven regard by each minister for the field of his colleagues. Begin with transport problems and you come to coal, to roads, to the iron and steel industries, to facilities for agricultural freight; begin with mass unemployment and there is no end to the domestic interests or foreign territories involved. The Minister of Labour sets the ball rolling, and involves the Foreign Office; but this involves the Colonial Office, which has jurisdiction over many Mohammedans. Or there is a question of cattle imports raised by the Ministry of Agriculture, whereupon the Board of Trade and the Treasury become unavoidably implicated for maintaining the balance of payments. And so on. Only in the minor matters are the departments entirely self-regarding; and these, as a matter of fact, can hardly ever occupy the personal attention of the minister.

*The Location of Responsibility.* Hence, even apart from the political value of the principle of collective responsibility, the actual condition of state activities compels solidarity. The history of English government since 1689, shows, however, a steady

development of the principle of collective responsibility, not as a means to the efficient coordination of services, but as a means to locate and intensify the sense of responsibility. The purpose is not merely to secure one body because it is one and therefore unmistakable, although that is important in the highest degree. It is also to secure that each member of the cabinet shall be his brother's keeper, especially if he is a particularly weak or a particularly headstrong brother. Even if ministers do not actively play the proctor over their colleagues' policy, the theory is that they ought to. The knowledge that an individual's error may entail collective damnation is supposed to intensify each minister's interest in all branches of administration.

This principle is effective in British government, but like all principles it is as effective as circumstances will allow: the more the pressure of departmental routine, the less can ministers be interested in the activities and speeches of their colleagues; individual interests are so very various that it is only on the very highest and critical matters that the principle operates. The presumption, however, exists, and it is advantageous. Every minister has the duty and the right to discuss and in all ways to offer to improve his colleagues' policy and administration. The disadvantage of the system was pointed out by Morley: "The Chancellor of the Exchequer may be driven from office by a bad dispatch from the Foreign Office, and an excellent Home Secretary may suffer for the blunders of a stupid Minister of War." This cannot be avoided if the good in the cabinet system is to be retained: for to enact individual responsibility would be to encourage each minister to defend himself by pleading his colleagues' culpability, and to be always on his guard rather than open and frank when in council. Nor, as we have shown, is it possible to sever distinctly one branch of public business from another—and the defense would then be, "Had he not done that, and insisted on the other, I should never have been obliged to do this." That way lies the downfall of unity

of the cabinet, of frankness in council, and indubitable location of responsibility. We shall see that other manners prevail in other nations.

Would it be possible for the government of the country to be conducted by a changing assortment of ministers regardless of party ties? Yes—if the foreign policy never involved the Exchequer in unwelcome expenditure; if it never raised issues affecting domestic industry, agriculture, and commerce; if it never caused a disturbance in imperial relationships; and similarly between the various other departments. Yes—if men were content to manage their own department only and to have no other interest either in policy or sympathy with groups of their fellow citizens. These conditions are normally quite impossible, though they are nearly realized in the United States presidential executive. Hence a certain pre-established harmony of policy is necessary; hence, an agency, party association, and collective responsibility is indispensable.

*Collective Responsibility versus Collective Decisions.* However, the principle of collective responsibility means only that ministers answer as one, and in the same sense, for any action in the lifetime of the government. It does not mean—at least, it has not meant—that there is always or often collective counsel or decisions upon everything, even of importance. So much was admitted by Gladstone. We know, for example, that three or four men of outstanding talents and public importance have ever formed, with the prime minister, an informal but definite association called the "inner" cabinet. This is not, and never has been, an institution with recognized public status; it is the spontaneous creation of resourceful kindred souls, as may be proved from anyone's experience of committee work. In English history we see this varying body of cognate leaders fashioning the most important policies, deciding on important offices, settling parliamentary or electoral tactics, with a very energetic day-by-day interchange of thought among them constantly proceeding. They shape their policy and get the cabinet to agree; or see

ministers individually and persuade them to agree when the cabinet meets; or act without at all consulting the rest of the cabinet. Yet the whole cabinet is responsible. Collective responsibility has been interpreted to extend to ministers' speeches in the country, since these might seem to commit the whole cabinet.

Then the immense expansion of departmental work and the increase in the number of departments makes full discussion impossible. The minister is too overburdened by his own concerns to be so fully informed or interested in other matters that his judgment is in any sense considered and real. From weighing up the loss of revenue if rebates for local rates are given on playing fields, the Minister of Health must suddenly turn to constitutional reform in Kenya; from speculating upon Soviet propaganda in the British Empire, the Foreign Secretary may be asked to vote on the inclusion of the formula "genuinely seeking work" in an unemployment-insurance bill; while a Chancellor of the Exchequer, overwhelmed with preparations for the Budget, is worried into violently prompt considerations of trade policy with the Dominions or a sharp rise in world prices. He is apt to continue to think of his own work while his colleagues are discussing matters of joint concern. Further, the size of the cabinet has increased in proportion as the principal governmental departments have grown in number. Discussions are either conducted with a loss of concentration, or, if some take up more than their arithmetical share of time, the rest contribute nothing but a vote.

However, it is an exaggeration of serious proportions to hold with one former Conservative cabinet minister that:<sup>30</sup>

The one thing that is hardly ever discussed is general policy . . . The whole system is one

<sup>30</sup> Cf. L. S. Amery, *The Forward View* (Oxford, 1944), pp. 443-45, and *Thoughts on the Constitution* (Oxford, 1947), pp. 86-89. Both these works are seriously marred by an antiquated view of the constitution, in which the initiating governing power of the Crown (the cabinet) is over-stressed and the power of parties, Parliament, and the electorate undervalued and even disparaged.

of mutual friction and delay with, at best, some partial measure of mutual adjustment between unrelated policies. It is quite incompatible with any coherent planning of policy as a whole, or with the effective execution of such a policy. It breaks down hopelessly in a serious crisis where clear thinking over difficult and complex situations, definite decisions (not formulae of agreement) and swift and resolute action are required.

This judgment is wildly exaggerated and a little irrelevant. It omits altogether from the account the fact that "general policy" is made by the political parties, if the word "general" has a meaning. It isolates the cabinet from the other policy-forming institutions of the nation. It depreciates beyond what is real the interchange between the core of the cabinet ministers who form the "inner cabinet."

These facts, and the need to secure mature consideration of policy, have caused the development of the practice of submitting particular branches of policy to committees of the cabinet, of which a more detailed consideration is undertaken presently.<sup>81</sup> This practice is almost as old as the system itself, but in recent years it has become more urgent than before, owing to the enormous growth in the amount and complexity of business. As matters arise upon which preliminary study is essential—that is, where a policy has to be elaborated from the first careless inspiration, and where it must be measured by the standards of the scientifically possible—*ad hoc* committees of three or four members are appointed from the cabinet, members especially interested or capable being selected, or indeed, almost selecting themselves by their acknowledged interest or capacity. These prepare the subject, with the aid of departmental experts and friendly nonofficial advisers, and report to the cabinet, which may do whatever it wishes with the recommendation, but which is likely to accept with little amendment, owing to the casual nature of their knowledge of the subject and the burden of their preoccupations. This development is necessary and beneficial and is bound to go further. Collective council is

not absolutely necessary to collective responsibility where members of the cabinet are all of one party, and linked, as they are, to the electorate by the bonds of a party program. Furthermore, as we shall see presently, various ministers have come to be grouped in permanent cabinet committees for large interdepartmental planning, to save the cabinet's time and to free it for the highest policy of all.

It will be appreciated that a cabinet will resign as a body only if its over-all, essential policy is rejected by a frontal assault in the Commons, or by the firm repudiation of some branch of its policy on which it places exceptional significance (for example, housing or food-subsidy policy, in a Labour government) and which is usually closely bound up with its general character and policy; or if it is overtaken by internal differences and loss of self-confidence and needs the fresh breath of a popular re-election to redefine its policy and restore its authority and courage. If, in what may be the long interval before such pressures come upon it, there are individual examples of ministerial incompetence or sustained and irreconcilable opposition within the cabinet, what is to be done?

More and more, as the cabinet as a whole becomes impregnable because it possesses a party-prefabricated solid following in the Commons and the country, it is both a necessity and the practice for the prime minister (and the inner cabinet group) to obtain the resignation of the errant minister and periodically to reform the cabinet—and thus to satisfy the needs of efficiency, the self-respect and prestige of the cabinet and the party, and to cease to present a weak flank to the Commons and the press and the nation. The Labour government began in 1945 with a cabinet of elders of the party, and events and experience caused it to carry out successive reconstruction to substitute the younger men now tested in minor office and in Parliament. There is a noticeably increased tendency since World War I to maintain the integrity of the cabinet by discarding the incompetents and such incubuses as may be technically

<sup>81</sup> Cf. p. 604.

capable but whose personality is so prickly as to draw upon the government, which must get its business done, uglier opposition than necessary. But some ministers may be dissatisfied with the cabinet, and they may not be able to persuade their colleagues to change their policy. They may then resign—like Mr. Eden, Mr. Duff Cooper, and Lord Salisbury, in 1938 and 1939 after Munich—to signal their disagreement, and may explain their position by letter and then in a special time available for them in the House of Commons, after which they will take their chance that their own persuasion and political events may vindicate them in the future and some day restore them to office.

*Unanimity and Secrecy.* This brings us back at once to that which we were concerned to labor in a previous page: namely, that the vital principle of collective responsibility is the homogeneity of the party upon which the cabinet is based. The spiritual condition of vigorous, frank, and independent creativeness, which is productive of so much good, is that there should be only a small risk of disruption and self-seeking; and this is provided by the political unanimity of the cabinet. Another condition, which is made really practicable only by the existence of political unanimity, is the secrecy of the cabinet proceedings.

Cabinet meetings are very private. This characteristic appears to me not to have commenced on any grounds of modern utility. I should think it was rather that, at first, royal councils were private because, in the days of conquest and challenge to the throne, the success of many royal policies depended upon surprise, and because strong government was secured by the authority which attaches to mystery rather than by open public consideration, and, later, because the Crown and Parliament were in conflict. Since 1832 the government of the day has had to secure its inner deliberations from the premature attention of an organized opposition in Parliament and the country, too well aided by the press whose eyes and ears are everywhere. Further, since

government is so pervasively occupied with the economic and social order, any policy may affect thousands of powerful and wealthy citizens, whether they be "economic royalists" or trade unions, so that if a secret is divulged before action is taken, it may happen—indeed, it has happened—that such citizens have evaded the government's intentions. Another thing must be remembered: to disclose what happens at the cabinet is inevitably to disclose differences among its members: to do that is to give the opposition the opportunity of playing upon those differences, and inevitably to cause a breakdown of united responsibility and to encourage mutual recrimination and individual reticence and distrust among ministers. Finally, publicity must reduce the independence of mind of ministers in relation to each other, and, by exposing them to the intervention of public opinion, reduce their mature, rational, and independent contribution to the process of policy making. A prime minister put his finger on the heart of the matter when he declared<sup>32</sup> that privacy of discussion "could only be made completely effective if the flow of suggestions which accompanied it attained the freedom and fulness which belonged to private conversations—members must feel themselves untrammelled by any consideration of consistency with the past or self-justification in the future." He wanted "irresponsible license in discussion." Inkings of these truths are to be found in the memoirs or speeches of cabinet ministers, though none expresses the whole philosophy.

The secrecy of cabinet proceedings is safeguarded by law and convention. The Official Secrets Act of 1920 forbids the communication to unauthorized persons of official documents and information, with heavy penalties. (The law was enforced in 1934 by a fine against Edgar Lansbury, son of a former cabinet minister, George Lansbury, in the biography he wrote of his father in which a memo-

<sup>32</sup> Lord Salisbury, in Gwendolen Cecil, *Life of Salisbury* (London, 1921), Vol. II, p. 223.

randum submitted to the cabinet was published.) The rest is convention. If a minister wishes to speak or write in his defense on leaving the cabinet, convention requires that he obtain permission of the Crown, whose servant he formally is, but this means getting permission from the prime minister—sometimes not impartial in the matter. Sooner or later, in biographies or defense in the Commons or Lords, the facts seep out—but rather later than sooner: that is to say, when publicity can do no harm to contemporary mutual trust and faithfulness of ministers. The guesses of the journalists may be inspired, but they are only guesses and can be brushed off as only guesses.

It is of special urgency in days of high nationalism and warlike friction between impassioned nations that the cabinet's state of mind not be made the subject of distracted and inflammatory debate until it has arrived at a considered policy. We may remark also that if secrecy helps to produce unanimity by preventing the obtrusion of public and disturbing elements into discussion, political unanimity is a very important condition of secrecy. Both help to concentrate responsibility upon a single unit, the cabinet, and since, also, responsibility is shared by all, and since no exact discrimination appears between the real and the supposed authors of a policy until long after the event, the more care has to be taken about the inclusion of people in the cabinet, for no one may be included who is so incapable as to cause its better members to fall.

*Efficiency of the System.* We have still to determine the real meaning of "responsible," but we postpone its consideration until we have indicated the significance of certain subsidiary facts. The cabinet, constituted and responsible as we have described, is the energetic, driving force in a government. In each department it sets the direction of administration, and a fairly harmonious tendency permeates them all. Economic and political circumstances (analyzed in the chapters on party) and a fortunate instinct for the basic necessities of government endowed England for a considerable

part of the last century with the sufficient semblance, and sometimes with the reality, of a two-party system. This meant that there was assured to the majority party a stable period of government, which, from the Grey ministry which began in 1831, to 1940, amounted to an average of three and three-quarter years per ministry.

The effect was that not only did the whole ministry have time in which to consider, introduce, and pass its legislation, but it also had time to affect considerably the execution of the law, which, up till 1850, was perhaps more important than legislation as a part of modern statecraft. Nor is that all; for if we excluded the transition ministries when parties were in an abnormally fluid state (such as the first Peel ministry of 1834-35, the first and second Derby-Disraeli ministries of 1852-59, and one or two in the early home-rule period), we should find the average length of a cabinet substantially longer than three and three-quarter years. Each minister can never hope to learn everything about his department, but he can hope to learn much about his civil service advisers and sometimes impress his personality and politics upon them. This cannot be done in a short time, for the minister is usually an amateur and knows little about the office to which he is appointed. There is some good in this, for he is often prepared to overturn bad precedents as well as good. At the end of six months he is just beginning to know his own men and the rudiments of their craft. How can he be effective unless he has time to go further and become capable of independent decision? Though it may be argued that with the certain prospect of only a short term in office, the minister will be the more energetic, we may be sure that such energy will be no more than frantic. Only a long period in office gives men the knowledge, the composure, and the appetite to undertake large projects which will bear fruit in their time. Moreover, it is essential to give every holder of authority in the modern state ample time for second thoughts—for the issues are so complicated that only per-

sonal experience and touch can unravel the wrappings of their novelty and make real their quantitative and correlated weighing. The convention and the practice of the responsiveness of the civil service to ministers is partly the result of their length of time in office.

The cabinet gradually hammers out its program of legislation, bringing its general principles into closer relation to the concrete possibilities as disclosed by careful examination of the advice of the administrative experts and scientists, and by the arguments of Parliament. The crude clay of desire is fitted into the mold of natural possibility, and the result desired is attained with the minimum of violent collision and coercion. In this process the cabinet is not in relation with Parliament alone, but with its party and the deputations of citizens who treat with individual ministers. It learns just how much Parliament and the public want and can take: and so also receives constant psychological collaboration. There is a continuous exertion of influence upon the cabinet by the public through channels other than the formal representative body, and this influence, already large in our own day—so large as badly to frighten those who desire the exclusive location of publicity and regularity in representative bodies—is bound to become larger. After so short and special an experience of parliamentarism, we have not yet exhausted the possibilities of governmental invention. It has been found that action through the constituencies, the parties, and Parliament is too slow and technically too irresponsive to meet certain emergencies—while men, in each other's immediate presence, arrive, for good or ill, at understandings which are impossible amidst the exaggerations and distortions of "representation." In these cases it has happened that some members of the cabinet are deputed to intercede: usually in cases in which the need for the continuity of social services would sooner or later necessarily involve the government in what seemed, before the basic industries were nationalized, to be a dispute between two nonofficial groups over an

apparently private matter (as in transport or coal mining or the textile industry or the price of food), since nationalization is clearly of universal concern.

The cabinet, as we have already shown, has a very effective control over the time of the House, and this enables it to decide the priority of business and the amount of discussion allowed to each item. This has been possible only when majority-party cabinets have existed. Ministers also guide the standing committees even where only details are supposed to be in question. We have also shown how the custom of the constitution and the procedure of Parliament throw upon the cabinet sole responsibility for the finance of government, with the attendant benefit that ways and means are correlated to expenditure by one mind, and that policy and finance are considered in a continuous and living relationship. Then the cabinet is the more securely attached to the House by its whips.

Before the country the cabinet is a unit: answerable, energetic, and more than a mere official governing body: it is an ornamental-philanthropic convivial institution, whose attendance at city banquets, motor shows, new hospitals, football, cricket, and boxing matches of national, international, and imperial importance, and the opening of sewage works and maternity homes brings it into brotherly touch and familiar *tutoyage* (in England indicated by the application "old" or followed by the diminutive form of the name) with rich and poor, giving to all the illusion that, after all, "there is no sovereignty except mine."

*The Status of The Crown.* Between the cabinet and the Crown there is a continuous and close contact. Here we have only to make some general observations. Ministers are formally "His Majesty's Ministers," but convention has made them the people's ministers, and responsibility, which was formerly to the Crown, is responsibility to Parliament and the people. This responsibility is assumed by the minister by his acceptance of the principle that all the public acts of the Crown need countersignature by a min-

ister. The countersignature is the sign that responsibility to the sovereign, whatever the sovereign may really consist of, is accepted. The person of the Crown is thus almost entirely lifted out of the sphere of political decision. Yet there are certain conventions which still provide the Crown with the possibility of political activity. They are *first*, that the Crown has the right to information about cabinet decisions and parliamentary proceedings; and *second*, that the Crown has the right to communicate with (to warn or encourage) its ministers, either through the prime minister or directly—both of these on the basis that the Crown should have the right to explanation of that for which its consent is asked.

Once those rights are existent, the way is open for any amount of royal influence which the cabinet, Parliament, and the country are prepared to tolerate. They are not in our own day inclined to tolerate much, but though it is puny, it is more than what is recognized by those who imagine that the plenitude of governmental power has passed from the hereditary to the elective institutions. Broadly speaking, since the death of Queen Victoria, royal intervention has been used only to advocate the unity of the nation, at times when party and group warfare has threatened to cause violent dissension, and to promote "national" and imperial interests in international affairs. All depends upon personality and talent, but the hereditary, symbolic, and specially manufactured social status of the Crown enable it to exercise a unifying influence in cabinet counsel. It is not a power *behind* the cabinet, but *by* and *with* the cabinet, and, of course, never against its determined will. It has some field of personal authority in certain cases of dissolution of Parliament; and in the creation of peers to help a government to carry a policy through the Lords.

*The Nature of Cabinet Responsibility.* If responsibility is supposed to keep cabinets in the path they ought to go, what is the motivation and directing force in responsibility? Responsibility means that a position of trust is held; that is, that

power can be used only within certain defined limits. The question is, then, who draws those limits, who watches over them, and what is the punishment for their violation? Until 1689 the limits were drawn by the Crown, and the Crown itself was prompted by some reference to the state of opinion in the country and Parliament and among its friends. No organized and acknowledged institution expressed the limits of royal discretion, for Parliament spoke as a congeries of individuals or groups, neither unmistakably nor in unison; the people were subject, not sovereign; the state of representation was purposely vicious; while there was no question, until matters reached a revolutionary point, of really disciplining a king in the only effective way then known—by civil war.

Since 1689 the successful governmental contrivance was found of an irremovable but powerless Crown, and a powerful but removable ministry. Between the time when the early system was driven to its fall, and the rise of the modern system, the device of impeachment was tried—that is, a formal trial of the conduct of a minister before the House of Lords, which might end in exile, imprisonment, fine, or death. (The United States constitution contains this prescription regarding the President—article II, section 4.) This method of imposing political responsibility failed because in its time it was difficult to distinguish the part played by the Crown and that played by ministers in any specific act of government. Even had it not failed on this account, it would have deserved to fail on another: it was too serious a penalty to use for small errors, and too dreadful to carry out in any case. For to govern is to venture to create, and no creation is without risk of error; while even when a policy is successfully realized, the more successful it is, the less will political opponents like it, and the more jealous and ready to impute sin will they be. To prescribe a grave penalty for failure to satisfy avowed opponents is to paralyze government, while heavily to penalize error is to extinguish experiments the

results of which must always be speculative. Supposing impeachment and execution were the consequences of an ill-timed return to the gold standard! Mr. Churchill would have been condemned to death in 1925 by followers of J. M. Keynes! A mode of settling responsibility was needed not so suspiciously partisan or criminal in aspect; and with it a means of punishment was required severe enough to discipline leadership yet not so severe as to kill it. These things were found in collective responsibility on a party basis, and the loss of office when this had been abused.

Now there have been times when the House of Commons itself has decided the terms of satisfactory cabinet leadership. There were years when parties were fairly evenly matched and liable to disintegration and would transfer their allegiance upon the issues presented to them. This state of affairs ceased to exist in 1896, and even before that, from 1867, did not exist save on matters relating to Ireland: that is, the cabinet had not to face a possible defection and loss of office as correctives. What then? Of what use, in such circumstances, to say that the cabinet is responsible to Parliament? The truth is that the responsibility of cabinets need not be forced, and yet responsibility may be none the less strict if the cabinet voluntarily accepts the burden: that is, the convention of *quod populo placuit leges habet vigorem* has grown up and constitutes part of the ever-effective controlling spiritual force of English politics.

This convention might continue and operate beneficially in its vigorous youth, and by virtue of the memory of the disaster which befalls politicians and people when it is disregarded, but men too soon forget the lessons of other people's experience. At the date when the House of Commons ceased to be the headmaster of cabinets and, reversing the parts, came instead under the cabinet's tutelage, the cabinet learned to obey a new mentor: the people. If it does not please the people, it loses votes for its party, and this means a loss of its own power and a gain for the opposition. At least, the cabinet

thinks so; and *this belief is the vital animating principle of the British constitution*. The House of Commons is the forum of debate, and the theater in which is conducted the comparatively rational dissection of conduct, but the investigation and the defense are not, in the ultimate resort, for the House: the ultimate spectators and judges are the party councils, the multitudinous groups, societies and associations, and the voters.

*The Meaning of Office*. Is that all? To lose office? No graft? None! Is there nothing stronger in the constitution to keep ministers continuously impelled by a sense of responsibility to the people? Can this possibly be effective? Strangely enough, it is. The prospect of losing office is a very strong corrective in British politics! For when office is lost, prestige evaporates, dignities are transferred, authority and dominion vanish! The man is smaller than the office, and friends turn away to new sources of favors *ubi bene ibi amicus*! The world treats the unlucky and the unsuccessful with ill-disguised contempt. The House no longer hangs upon their lips, and it is not altogether pleasant to lose official emoluments. Although most men sighingly protest that duty alone forces them to suffer the intolerable burdens of office, only those who are in office, or sure of it, make such complaint: the rest are strangely silent. Nor is any desperate energy or dispatch shown to leave office. For though all the motives we have insinuated do operate, there is still one of greater strength: and that is, that those who possess office in Britain control a vast range of political opportunity. All that they strive to amend in a faulty state, all that they desire to protect from savage aggression, becomes possible when they are in office and impossible when they are out. It is a question of who shall, for a stretch of time, be sovereign or subject—you, your class, your idea of your country, or other people and their ideas and interests? Gladstone speaks sound sense on this subject.

The desire for office is the desire of ardent minds for a larger space and scope within which to serve the country, and for access to

## CABINET RESPONSIBILITY

the command of that powerful machinery for information and practice which the public departments supply. He must be a very bad minister indeed who when in office does not do ten times the good to the country that he would do when out of office, because he has helps and opportunities which multiply twenty-fold, as by a system of wheels and pulleys, his power for doing it.

The number of careerists, pure and simple, is rather smaller in British politics than elsewhere, and the number of men and women positively and passionately devoted to their own idea of social amelioration greater. Gladstone has been quoted, but a more recent prime minister avows the same passionate attachment to power. Neville Chamberlain confided in his private diary on the publication of his brother Austen's political letters: <sup>33</sup>

He has not the eagerness of temperament and the inexhaustible vitality of Father [Joseph Chamberlain], which kept him ever revolving some constructive idea . . . I believe I lie somewhere between the two . . . there are very few and brief moments when I feel I can't bear to talk or think of the politics that have become my main purpose in life. Indeed, my fear is always lest this prime interest should obliterate my other interests in art or music, or books, or flowers, or natural history.

The potent impulse of duty to society, the strong and irrepressible disposition to "give the lead" to other people, the avidity for power and prestige, the enjoyment of the tumult of business, the itch for fame coupled with the half-conscious memory of revered statesmen of the older school, and the sheer blind loyalty to a party—all play their part in driving men and women into politics and place. Take any or all of these factors, make one or all an intensely strong urge in an individual's life, then threaten to balk the free action of that passion, and is that not surely a compelling regulator of the statesman's action in politics? Hence office means much; and its loss also; and those pleasures and pains are the sanction of responsibility.

Moreover, as we have already shown,

there are no formal limits to the sovereignty of cabinet-cum-Parliament. Cabinet responsibility and the whole electoral process are intimately bound together. This means that the cabinet has considerable latitude in the freedom to initiate and execute policy. After all, the cabinet consists of the leaders of the majority in Parliament and among the electors and the managers of the party machine. It will go beyond the possible margin when, like Peel, it emancipates the Catholics or repeals the Corn Laws, or, like Gladstone, springs Home Rule upon its party, or, as in 1935, pursues obstinately a foreign policy of appeasing potential aggressors. But with time and care, persuasion and coaxing, it can exploit to advantage the prestige and status and leadership and the accumulated loyalty of a decade or two, into an initiative independent, at least, of previous pledges to the electorate. Thus Disraeli and parliamentary reform, thus, the Labour government and the abundant fullness of its nationalization program of 1945-49 and particularly its reform of the House of Lords; so, especially in foreign affairs, and in many minor matters. Nor is there any doubt that this is good democracy. So long as government is for the people, and by their frequently elected and recallable representatives, it is proper that they should lead the people as well as follow them.

The cabinet system could not work at high efficiency were it not for a number of accessory factors in designed combination. These are: (1) the organized arrangement of the cabinet's work through committees, interdepartmental coordinative arrangements at the official and ministerial level, served by the cabinet secretariat and the economic, statistical, and planning staffs, and linked with official consultative bodies representing economic interests; and (2) the neutrality and anonymity of the civil service, not less than its superb ability. These may be called *technical factors*. There are others which may be called *party factors*: (3) party control through the caucus and representative devices, and (4) the continuous exist-

<sup>33</sup> Cf. K. Feiling, *Life of Neville Chamberlain* (London, 1946) p. 287.

## THE BRITISH CABINET AND ITS AUXILIARIES

ence of a "shadow" or "ex"-cabinet composed of the leaders of the opposition. Each will be discussed in turn.

### CABINET COMMITTEES, SECRETARIAT, AND ADVISORY BODIES

THE discussion of this accessory factor is rather more extensive than the rest, owing to its peculiar role in a democratic social-state.

Before 1916, the cabinet met without any carefully planned agenda. Of these meetings no minutes were officially taken, though the prime minister sent a note of the result to the Crown, and other ministers scribbled private notes of what occurred.<sup>34</sup> There was serious need for such a plan of business and a formal record of transactions, as the many complaints by ministers and their fretting secretaries about the haziness of cabinet decisions show, and as the number of important disputes about the distribution of responsibilities historically demonstrates. From time to time some records were drawn up, but a continuous recording secretariat was late in coming—*first*, I think, because of the convention of secrecy, and *second*, because of the atmosphere of suspicion and factious hatred in politics of 1689-1832, partly due to the lasting consequences of the change of dynasty, when the minutes of the previous body of ministers (one can hardly say cabinet in a modern sense) might have been used as the basis of parliamentary recrimination and even impeachment. Then, *thirdly*, when the growth of business might have already pressed for new developments, individual ministers were probably too busy with their own work to think and demand a better system, leaving it to the prime minister and the "inner" cabinet to decide the order of business. But today the appeal is openly

to the people; no minutes can involve a cabinet more than their policy has already done; and the way was clear, from 1900 at least, for these formal records. The spirit of "it-is-not-done" was not, however, overthrown until World War I showed that it was humbug; and since the advent of Lloyd George's war cabinet in 1916, the cabinet has had a secretariat, agenda, and minutes. The secretariat was also in close personal relation with the Committee of Imperial Defense of which the prime minister is chairman;<sup>35</sup> in 1938 when the great first secretary, Sir Maurice Hankey, retired, his successor, Sir Edward Bridges, became secretary to the C.I.D. also. But in World War II the Committee of Imperial Defense was merged in the War Cabinet organization, and after it, as will be shown presently, its successor became an integral part of the committee organization of the cabinet.

It must be borne in mind that the Cabinet meets normally once a week, and yet the control by government of the social and economic life of the nation is remarkably extensive and penetrating. To acquit its obligations so that the nation may thrive, a mere meeting of the cabinet is palpably far from enough even with emergency meetings when necessary. The cabinet needs help. Gradually since 1919, more swiftly during World War II,<sup>36</sup> and even more resolutely and consciously since 1945 an advisory and revolutionary system has been constructed to serve the cabinet. Its features are: (1) cabinet committees, and then the official auxiliaries: (2) the cabinet secretariat or offices, (3) an Official Steering Committee, (4) the Economic Section of the Cabinet Secretariat, (5) the Central Statistical Office, (6) the Central Planning Staff, and (7) the Industrial Productivity Committee. Working with it very closely also are (8) the Treasury, the Departments, and the Corporations, and (9) consultative auxiliaries and working parties in industry.

*Cabinet Committees.* The cabinet does a considerable part of its work through

<sup>34</sup> For an account of this body, concerned with the military problems of the Commonwealth and Empire, and linking the British cabinets to the governments of the Dominions, see H. Finer, "Cabinet and Commons under the Impact of War," *Political Science Quarterly*, September, 1941; and M. Hankey, *Diplomacy by Conference* (London, 1947), Chap. 4.

<sup>35</sup> Cf. Hankey, *op. cit.*, Chaps. 2 and 3.

<sup>36</sup> Cf. Finer, *op. cit.*, pp. 321-60.

committees of itself. Their number, their exact terms of reference, when they shall report, who shall compose them, are entirely in the hands of the cabinet, especially of the prime minister. They are parts of the cabinet—its agents—and have no being apart from it; their status is not and cannot be independent of it. It is only by accident that the existence of the committees may become known: their composition is not officially disclosed in order to preserve the principle of collective responsibility. As Herbert Morrison, Lord President of the Council, explained to the House of Commons:<sup>37</sup>

I cannot take my honorable friend far into the secrets of Cabinet organization . . . The Cabinet is responsible for the acts of Government, just as Ministers are directly responsible to the House. How the Cabinet does its business, and to what extent it delegates certain things to Cabinet Committees is, if I may say so, the Cabinet's business because it accepts the responsibility. I can only assure my hon. Friend that decisions on policy, according to the nature of the decisions and their importance, the degree of their significance, and also the degree to which they may cause trouble and controversy in the House or the country, are settled at the appropriate level. That is, of course, the responsibility of the Government. These things are settled by one committee wherever possible, but the number of committees to discharge a series of functions is, of course, a matter of convenience and administration. . . It is not, of course, the practice for Governments to reveal the membership or chairmanship of Cabinet Committees if they can possibly help it. Indeed, we do not often reveal that they exist. . .

Of course, a name disclosed is an aperture for public criticism: and the criticism would seek to differentiate between the contributions of the named and unnamed participants in cabinet policy making.

A cabinet committee is composed of several ministers chiefly concerned with the subject matter to be decided. The chairman is usually the minister principally concerned. They often have at their sessions law officers and such civil servants as may be useful. They report to the cabinet, usually an agreed policy,

and thus save the cabinet's time. If agreement is impossible, then the unsettled issues are decided by the cabinet. Thus, they serve the prime minister by coordinating departments at a subcabinet level, and make feasible his "span of control" responsibilities.

The committees are of two kinds, temporary and standing, the former sometimes called *ad hoc*. Every now and again an *ad hoc* committee is set up to handle a special difficulty—thus, the development of atomic energy or the establishment of the national medical service as a going concern, given the refusal of most doctors to enter the service. Of this committee the Minister of Health was chairman. A housing committee functioned in 1945 and 1946, and perhaps later still, to prepare and facilitate the developing stages of the government's housing plans. At any one time there may be more than a score of these cabinet committees, most in operation more or less *ad hoc*, more or less permanently. Of recent importance were the Manpower Committee and the Fuel Committee. Their purposes may be inferred from the necessity of converting the economy of World War II to peacetime needs, the long economic emergency in the aftermath of the war, the nationalization of fuel and power, and the relationship thereof to exportable manufactures upon which the British standard of living precariously depends.

Among the standing committees of the cabinet are (1) the Legislation Committee; (2) the Defense Committee; (3) the Lord President's Committee; (4) the Policy Committee<sup>38</sup> (formerly Committee on Overseas Economic Policy); and (5) the Production Committee<sup>39</sup> (formerly the Minister of Economic Affairs Committee).

(1) The Legislation Committee is the

<sup>38</sup> Includes the Prime Minister as chairman, the Minister of Economics, the Chancellor of the Exchequer, the Lord President of the Council, the Foreign Secretary, and the Minister of Labour.

<sup>39</sup> Includes the Minister of Economic Affairs as chairman, Trade, Labour, the Treasury, Town and Country Planning, Fuel and Power, and Supply.

<sup>37</sup> Debates, February 28, 1947, cols. 2129-32.

former Home Affairs Committee, presided over by the Lord President of the Council, who in the Labour government of 1945 is deputy to the prime minister and leader of the House of Commons. It scrutinizes all legislation coming from individual ministers for technical and substantive characteristics, and deliberates on the priority and tactics of passage of the bills and other procedure in Parliament.

(2) The Defense Committee is of peculiar importance. At the end of World War II the Cabinet did not revert to the prewar Committee of Imperial Defense system, but instead adopted for defense purposes the arrangement which had served so exceedingly well during the war. In the war, the Prime Minister, Mr. Churchill, had assumed also the office of Minister of Defense and became thereby a superior unifier of the three armed services, War, Air, and Navy.<sup>40</sup> He was chairman of a Defense Committee of the Cabinet which included the ministers principally concerned with military operations and the Ministers of Production, of Supply, and of Labour and National Service. It was served by the Chiefs of Staff, themselves properly grouped in a committee, and by joint staffs for planning, supply, and the rest. Thus, planning for defense and action for defense were combined.

This arrangement has been adapted to peacetime purposes and, above all, linked organically with the economic and social planning activities of the government.<sup>41</sup> The Minister of Defense is now a permanent part of the machinery of government and a member of the cabinet. The Defense Committee is under the chairmanship of the prime minister, but since his load of business is heavy, the Minister of Defense regularly deputizes for him. The supremacy of the prime minister's authority must be noted. The membership of the committee is kept flexible, but, unprecedentedly, the government indicated its permanent nucleus: the prime minister, the Minister of Defense,

the Service Ministers, the Lord President, the Foreign Secretary, the Chancellor of the Exchequer, the Minister of Labor, and the Minister of Supply—ten ministers, of whom six are in the cabinet. The prime minister's formal chairmanship was explained to the House of Commons as follows:<sup>42</sup>

... the Prime Minister presides over the Defence Committee precisely because the wider aspects of defence with which I am now dealing must be dealt with by the authority of the Prime Minister who has to take full account not only of the claims of defence, but also of the claims of all the other activities of the nation, and obviously that could not be handed over completely to the Minister of Defence.

The Defense Committee, normally under the Minister of Defense, deals, under the cabinet, with:

The organization for national defence in its broader aspect, including both current questions of high policy in the sphere of defence, and also the preparation of plans over the whole field of government activity, both civil and military, for mobilising the entire resources of the nation in a major war. . . It will be responsible for the review of current strategy and also for the preparation of plans for the country's transition from peace to war. . . .<sup>43</sup>

Besides his duties of presiding, the Minister of Defense is responsible for (a) the broad apportionment of available resources between the three services in accordance with strategic policy, the framing of a policy of research and development, and the correlation of production programs; (b) the settlement of questions of general administration on which a common policy for the three services is desirable; and (c) the administration of interservice organizations, such as Combined Operations Headquarters and the Joint Intelligence Bureau.

(3) Most important for civil economic and social planning until September, 1947, was the Lord President's Committee. At that time its scope became less

<sup>40</sup> Finer, *op. cit.*

<sup>43</sup> Cf. *Central Organisation for Defence*, p. 7.

## CABINET COMMITTEES, SECRETARIAT, AND ADVISORY BODIES

clear and certainly was narrowed. Its title indicates its chairmanship. It is composed of ministers primarily concerned with home affairs and (to September, 1947) economic affairs—that is, all departments except Foreign, Colonial, Dominions, and Defense. This cabinet committee came into existence in 1940 (undergoing various transformations) with the cardinal purpose of bringing into regular and unifying contact the many departments involved with home and economic problems so that they might unitedly prosecute the main lines of policy required of them by the War Cabinet. The War Cabinet uttered its directives after it had heard the strategy prepared by the Defense Committee. The Lord President's Committee would declare how far its segments of the nation were able to meet the requirements of a strategy; would ask, if necessary, for modification of strategy; and in the end, would make commitments. Many disagreements were solved in this committee, relieving the cabinet and securing a concerted, reliable basis for military and production efforts.<sup>44</sup> The Lord President was one of the very few—usually eight—members of the War Cabinet. Other ministers besides those names above attended committee meetings when it was desirable.

(4) In the postwar period this committee was retained and it is still in active operation, but in respect of economic affairs it was supplanted in September, 1947, by the Policy Committee. This Policy Committee (or Committee on Overseas Economic Policy) has authority over the whole range of the nation's economic affairs.

(5) Until September, 1947, the Lord President's Committee coordinated all the domestic departments. It was the link between other committees of the cabinet, especially the "Home Economic Committee," also presided over by the Lord President of the Council, and the "Overseas Committee," presided over by the prime minister. It brought together the

research auxiliaries of the cabinet and serviced the committees with the latter's abilities. It supplied the cabinet itself with fully made or partly manufactured policies, as the result of deliberation and the settlement of differences at the ministerial level. Where agreement proved impossible to obtain, it appealed the raw material to the cabinet itself. (Any minister, of course, retains the right to appeal to the cabinet, and if the latter wishes, may attend the cabinet for a hearing.)

The Lord President's Committee surveyed the whole field of government (excluding the foreign): social services, social security, physical planning, housing, health, education, police, civil defense, pensions, and local government. Coupled with the fact that Mr. Morrison was at the same time deputy leader of the House of Commons and chairman of the Legislation Committee, a valuable unity of foresight and departmental concert was in the making. Mr. Morrison had the robustness of mind and body to carry it along, until a serious attack of phlebitis in the late winter of 1947, when, in any case, the disastrous urgencies of the Great Blizzard necessitated reorganization of the system.

When the reforms of September, 1947, were made, that is, when Sir Stafford Cripps was made Minister of Economic Affairs, he became heir to the "Home Economic Committee," Mr. Morrison's hard-driving ministerial committee. It became known as the "Minister of Economic Affairs Committee"—and more recently as the "Production Committee." The Minister of Economic Affairs presides over it (it will not be forgotten that Sir Stafford later became Chancellor of the Exchequer, while still holding the title and powers of the Minister of Economic Affairs), and it is concerned with the day-to-day coordination and promotion of the economic program. The Production Committee has command of the entire program of production for domestic and export purposes, including coal and power, building, shipbuilding, agriculture, the allocation of raw materials, and capital investment.

<sup>44</sup> Cf. especially Sir John Anderson, "The Machinery of Government," *Public Administration*, Autumn, 1946, especially p. 153.

The various cabinet committees are served by subcommittees; and ancillary to each are committees of officials, to furnish the expert information. All the committees are thus personally linked to each other to a very considerable extent and simultaneously to the cabinet. The system is highly integrated and coherent, but the work that burdens ministers of cabinet rank who are at the same time members of cabinet committees is back-breaking.

*The Cabinet Secretariat.* The cabinet secretariat performs strictly secretarial functions. It circulates the memoranda and other documents necessary for the work of the cabinet and its various committees; marshals the agenda for each cabinet meeting under the direction of the Prime Minister; performs the same service for the cabinet committees under directions of the respective chairmen; circulates the notices of meetings; records and distributes to those who are concerned the cabinet's conclusions and draws up the reports of cabinet committees; and keeps the papers and conclusions of the cabinet subject to the cabinet's directions.

This means that the work of the cabinet and its committees is carefully prepared for before the meetings; that the general arguments, but not the record of the opinions of identified individuals, are set down together with a conclusion. The secretary sometimes insists on getting a formula for record where otherwise none is offered or where the discussion is inconclusive. It has been suggested that he sometimes needs to show "no little ingenuity and even inventiveness" in drafting it.<sup>45</sup> When the conclusions are reached, the secretariat sees that each minister involved in the conclusions gets his appropriate part, when it is for him to convert the decision into administrative action.

Only the secretary is present at cabinet meetings. He sits on the right-hand side of the prime minister and personally

takes the record of the meeting. Naturally, the preservation of neutrality and anonymity, the two stoical characteristics of the British civil service, find their apotheosis in him—beyond the suggestion of even a discreet smile, it is said.

It should be emphasized that the secretariat is not advisory to the cabinet or its committees: it is secretarial. For advisory functions there has been established another part of the apparatus, to which we now turn.

*The Official Steering Committee.* Under Mr. Morrison, the Official Steering Committee was the central piece of machinery to assist the cabinet in planning. It functioned until November 20, 1947, when it disappeared in this form to reappear in another, under the aegis of and auxiliary to the Minister of Economic Affairs.

The Official Steering Committee consisted of the permanent heads of departments or their deputies representing the key economic departments, together with members of the Economic Section of the Cabinet Offices, the Central Statistical Office, and the Lord President's own office of planning advisers, administrative experts, "idea men," and scientific consultants. This, according to Mr. Morrison, formed "the central economic team responsible for gathering and assessing economic intelligence, preparing forecasts, framing economic plans, advising Ministers on the advantages and disadvantages of these plans, and keeping under review the execution of plans when authorized and put into operation."<sup>46</sup> There can be little doubt that it owed its conception to the interwar speculation on planning problems undertaken by men like Sir William (now Lord) Beveridge, by the research organization called *Political and Economic Planning* (the secretary of which became Herbert Morrison's assistant in the Lord President's Office), and by the present author. It secured co-ordination at the official as well as at the ministerial level. It spawned a number of

<sup>45</sup> Cf. L. S. Amery, *Thoughts on the Constitution* (Oxford, 1947).

<sup>46</sup> Cf. "Economic Planning," *Public Administration*, Spring, 1947, p. 6.

"working parties" (by which is meant "subcommittees," not the working parties that inquire into the reconstruction of the various British industries). Thus, one would be estimating the total manpower available and its forward distribution on various assumptions; another would be assessing the trend of investment and the problem of its guidance to meet immediate needs and prevent the onset of a depression; and still another would be watching the import-export relationship. They would thus produce the raw material for future estimates for planning purposes.

The "working parties" and the committee as a whole were simply advisory. The departmental representatives brought with them the not inconsiderable research and planning resources of their own individual departments and took back from the committee the view of the common good it had discussed and provisionally agreed to. From the Official Steering Committee there ascended to the Lord President's ministerial committee the predigested plans and estimates, forming the material on which the "political" mind could operate and eventually finding its way to the cabinet, so far as that was necessary. From the cabinet, through the Lord President, there descended to it indication of the general roads the cabinet was prepared to tread, having regard to its commitments to the country and Parliament.

*The Economic Section of the Cabinet Secretariat.* The Economic Section of the Cabinet Secretariat, a corps of professional economists, was established in 1941. It filled a yawning gap in the coordination of wartime effort, since to that time no extradepartmental body had worked parallel with the government on the intellectual plane. It receives all economic information marshaled by the various government agencies (central, local, and corporate) and repairs any gaps by its own research. It comments on the cabinet and cabinet committee information that comes in to it and prepares a picture of the general economic landscape to which the facts are tending, with warnings and fore-

casts of the probable outcome of actions or omissions to act. It serves the cabinet as a regular duty; but it also serves the various departments, and especially the Central Planning Staff when called in. It prepared the White Paper on *Employment Policy* of May, 1944, the *Economic Surveys* for 1947, 1948, and 1949—the so-called annual "economic budgets" which were an important advance in the statecraft of a planning age—and the White Paper on *Capital Investment* of March, 1948.

*The Central Statistical Office.* The Central Statistical Office was established as part of the cabinet secretariat in 1941, to produce a developing statistical series, general and comprehensive in nature, as an index to economic and social trends. It does not replace the statistical services of the various departments, which are highly developed and specialized, but looks at the figures from a different point of view, making correlations the department would not make and answering planning questions they would not seek to answer. The various excellent departmental statistical analyses assist and integrate with the analyses of the Central Statistical Office. Its systematic picture of trends is published in the *Monthly Digest of Statistics*, indispensable to forecasting and therefore to planning. It is of the highest political importance that this *Digest*, commenced during World War II for private circulation in governmental circles only, is now available to all. This means that the opposition may challenge the cabinet's plans with the very figures upon which they are based.

It is noteworthy that the planning activities of the government have necessitated the gathering of facts about business and industry more frequently and specifically than has hitherto been practiced in the censuses of production, taken at five-year or longer intervals, or gathered when royal commissions of inquiry investigated particular segments of the economy. The Statistics of Trade Act, 1947, empowers the government to require estimates and returns of any person carrying on an undertaking, for the purpose of obtaining

information necessary for the interpretation of economic trends and the provision of a statistical service for industry and for the discharge by the government departments of their functions. The gathering of this information is limited to the nature, size, location, and acquisition of the undertaking, its employees, remuneration, rent, taxes, capital assets, and other matters strictly connected with the general purpose.

Before moving forward to an account of the Central or Interdepartmental Planning Staff, which was established in March, 1947, it is relevant to draw attention to the government's conception of planning machinery to be instituted as auxiliary to government. The ideas are to be found in the White Paper of *Employment Policy* of May, 1944, and in the *Economic Survey* of 1947. The essence of the matter is coherence of minds, exactness of information, the earliest apprehension of the movements in economic and social life that must be mastered in order that the plans may come true, and help from industry in gathering information.<sup>47</sup>

The *Economic Survey* of 1947, in particular, sketched the organization and method of preparing "economic budgets," each relating the needs of its sector of the economy—thus, the defense forces, transport, agriculture, manufacture for export, housing, factories, plant, and so on—to the resources of manpower and material needed and available to satisfy its demands. These would be coordinated and shaped with attention to the total manpower and other resources available and the special problems of foreign exchange, capital equipment and maintenance, fuel, and power.

*Central Planning Staff.* Up to the time of the *Economic Survey* of 1947 (say March, 1947), the government experimented with the machinery already described. The government and its official advisers were too wise to believe that administrative machinery is prior to the functions it is to serve. They recognized that there was as yet no final compre-

hensive plan of objectives, and that there could not be, given the peculiarly contingent nature of the British economy, so dependent on foreign markets and international relations. But it was found that the machinery was not integrated enough to cope with the urgent short-term problems of a "siege economy" under threats of failure, often through the actions of foreign countries (such as the decontrol of prices in the United States) of which little previous notice could be had. Hence, a new piece of machinery, the Central or Interdepartmental Planning Staff, was established to provide a more comprehensive planning staff than the Official Steering Committee and a more organized contact with industry.<sup>48</sup>

In establishing the Central Planning Staff it was recognized that the foundation of the economic planning work would continue to be done in the departments. No outside organization can know enough the detail, the living inwardness and complexity, to be mastered—and mastered only because scores of men have been specializing in the departments it may be for thirty or forty years! But it had been found that the ordinary members of the top levels of the departments, willing and able as they were, could not give the appropriate time and attention to the Steering Committee. The Government therefore required the appointment in each department of a "whole-time planning staff, under a senior officer, charged with special responsibilities in that field." These officers would be the members of a joint planning staff something like that so successfully developed in the war for military production purposes. The main strength is the departmental planning officers, but to secure effective direction from the center, the government appointed a full-time executive head of the staff. It was recognized that this Chief Planning Officer must be a man of the most special attainments, and the Government appointed Sir E. N. Plowden, a distinguished wartime official who had come in from and returned to private industry.

<sup>47</sup> Paras. 81 and 82.

<sup>48</sup> Cripps, *Debates*, March 10, 1947.

The departmental planning officers are administrative-class officials high up in the hierarchy. Each has at least one associate whose duties are so arranged that he can concern himself mainly with inter-departmental staff work. The assistants work together in groups as needed for specific pieces of planning. The Chief Planning Officer himself needs and has only a small staff for programing and for secretarial duties.

The Central Planning Staff (in the cabinet offices at the outset) is concerned with the whole field of forward planning. It works in closest relationship with the Economic Section of the Cabinet Secretariat and with the Central Statistical Office. Indeed, since November, 1947, when it was switched to the Treasury, under Sir Stafford Cripps, there are observers who declare that the Central Planning Staff and the Economic Section resemble each other so very closely in function that they must either duplicate or share the work of forethought. By rational agreement between the chiefs of each organ, it is shared.

*Appraisal.* The planning system so far described, especially before the advent of the Central Planning Staff, suffered from three weaknesses.

(1) Full departmental autonomy still existed, despite the ministerial committees, specially the Lord President's. (These committees, of course, in many instances secured full cohesion below the cabinet level.)

(2) The permanent heads of the departments were far too busy to become planning statesmen as it were; they might be planning statesmen if they had the planning staffs, as set up by the Central Planning Staff arrangement.

(3) Within the Cabinet, the principal economic ministries were not organized hierarchically; they battled for pre-eminence; none was on top.

For the moment we have done with the first two weaknesses. Let us consider the third a little more closely. In a planned economy, who takes precedence—prime minister, Chancellor of the Exchequer, the president of the Board of Trade, or the Lord President of the

Council? Or, to omit the appellations and revert to the essential functions, the chief of the whole executive; the master of expenditures, taxation, and fiscal policy (including the expansion and contraction of credit); the controller and regulator of imports of all kinds, of rationing, and the targets for exports; or an organizer of planning? In fact, the Chancellor, the President of the Board of Trade, and the Lord President worked closely together, but what direction they should take was determined by argument among them, and the prepotency which won the day was not founded on superior status or necessarily on the merits of the case. The House of Commons sometimes asked, "Who goes in to bat first?" The answer depended on rational agreement, but there are plenty of rational alternatives from which the less rational may be picked—and the picking is sometimes determined by force of personality.

Two basic problems were met and answered under this system of interministerial bargaining. The first problem was the compromise between the short-term emergency situation of the country just emerged from five years of desperate sacrifice and privation and anxious for a little ease (an emergency especially connected with the "dollar gap"), and the long-term attempt to mend the worn-out and devastated permanent productive equipment of the nation and to improve on it. The second problem was the fiscal problem of cheap or dear credit. Both these problems were aggravated by the losses caused by the stoppage or slow-down of production due to the Blizzard of the winter of 1947, followed by the loss of American dollars due to the international convertibility of sterling permitted in July and August, 1947.

Again, drastic changes were necessary in objectives, and therefore in machinery. His austerity and drive caused the Prime Minister to appoint Sir Stafford Cripps as Minister of Economic Affairs on September 27, 1948, with an authority over all the economic departments. In November, on the resignation of the then Chancellor of the Exchequer, Mr. Dalton,

the Minister of Economic Affairs became the Chancellor of the Exchequer also. With the appointment of Sir Stafford as Minister of Economic Affairs, the Official Steering Committee lost most of its functions to the Minister's own committee and staff. The Minister was to coordinate the policy and activities of the production and economic departments. This would now be in the nature of an expeditor superior to the departments. By the November change, the hiatus between fiscal policy and economic planning was abolished.

Some changes (already noticed) in the ministerial committees and the auxiliary agencies naturally followed. The Lord President's Committee still remains for noninternational, noneconomic coordination and planning.

The ascendancy of Sir Stafford Cripps since his double promotion is evident. Most of the younger men in the government are Cripps's friends and protégés. This personal arrangement provides for a slant which is of the essence of every plan. It is one which has been supported not only by the cabinet as a whole, and by the party, but also by the opposition, which through its arguments in the Commons mobilized opinion and helped drive the government toward more attention to the short-term economic problem, to some extent for public and non-party reasons.

*The Industrial Productivity Committee.* The progress of scientific research is also linked to the deliberations of the cabinet. Before World War II, the state promoted and benefited from scientific research through the Department of Scientific and Industrial Research, other specialized research bodies belonging to the various departments of the government, and grants to the universities. During World War II Mr. Churchill established a unit of scientific advisers to the cabinet, of remarkable value to the prosecution of the war. When the Lord president's office became the center of planning under Mr. Morrison, a group of scientific advisers was set up therein, and the advisers participated at appropriate points in the research and planning

program. As time passed, this was not considered enough, and in December, 1947, the government created the Industrial Productivity Committee:<sup>40</sup>

To advise the Lord President of the Council and the Chancellor

ences which will best assist an early increase

vice on the manner in which the results of such research can best be applied.

The chairman of the committee is Sir Henry Tizard (formerly president of Magdalen College, Oxford, and now also chairman of the Government's Defense Research Policy Committee), and the other members are government scientists, university scientists, scientists from industry, a member of the Central Planning Staff, the director of the Economic Section of the Cabinet Offices, and the Lord President's personal secretary.

*The Treasury, the Departments, and the Corporations.* The major department of government is the Treasury, headed by the Chancellor of the Exchequer. Its outstanding status is symbolized by the fact that the Prime Minister holds the office of First Lord of the Treasury. The Treasury controls the estimates of all other departments and is the master of the civil service in the sense that it decides the numbers, pay, and qualifications of the entire service. Its Establishments Branch, its Organization and Methods Branch, and its Training Division gave it a part in the managerial planning of all the other government departments. The Treasury's responsibility for approving the budget and its obligation to devise the ways and means of raising revenue make it the engine of fiscal policy which harnesses and is harnessed to the total economic productive and distributive operations of the nation.

In the high state of nationalization which Britain attained in the years following 1945, the Treasury became the master of the Bank of England. Furthermore, the nationalization statutes made

<sup>40</sup> Debates, December 18, 1947.

the Treasury the financial and account-ant superior of the national transport, coal, electricity, gas, and communications corporations—the controller of their development policy, in most cases the guarantor of their loans and in a sense (as agent for the cabinet) the weaver of the widespread planning activities of the national corporations. The Treasury combines the major functions of a number of United States agencies—the Treasury Department, the Bureau of the Budget, the credit-granting agencies, the Federal Reserve System, the Securities and the Exchange Commission, and the more important functions of the Civil Service Commission. In a planning nation it has sovereign functions concurrently with whatever department or minister is specifically vested with the direct economic operations that planning requires.

When the changes of November, 1947, occurred, some planning and administrative changes became necessary. The Chancellor was given a third undersecretary, by the side of the Financial and the Patronage secretaries, namely, the Economic Secretary to the Treasury.<sup>50</sup> The Central Planning Staff with its director was transferred to become part of the Treasury organization, though retaining its identity. It remains in close touch with the Economic Section of the Cabinet Secretariat and provides interdepartmental services under the direction of the Chancellor of the Exchequer. In this, the staff which served the Minister for Economic Affairs cooperates.

*Consultative Auxiliaries and Working Parties in Industry.* In order to benefit from the industrial and financial experience of private enterprise and the advice and good will of labor at the earliest moment in the inception of plans, and also to gain friendship from those who will be affected by the plans, an Economic Planning Board was appointed on July 7, 1947. The chairman is occasionally the Lord President of the Council and more usually the Chief Planning Officer. The

membership consists of three nominees of the Federation of British Industries and the British Economic Council (a private body representing private industry); three nominees of the Trade Union Congress; the permanent secretaries to the Board of Trade, the Ministry of Labor, and the Ministry of Supply; three persons from the Central Planning Staff; and the director of the Economic Section of the cabinet secretariat.

There are several other consultative groups. In close touch with the Chancellor, and either directly or indirectly with the cabinet, is the National Joint Advisory Board, made up of employer and employee representatives, which is consulted in the early stages of high economic policy—for example, wages and prices policy. The planning requirements of the nation are disseminated through the National Production Advisory Council on Industry and its regional boards in order to get the maximum agreement and obedience without the coercion of executive commandments to industry. Finally, the Trade Union Congress is consulted at almost every step of major economic and social policy development, for it represents almost all of the organized workers.

Early in 1946 the president of the Board of Trade set up working parties in a number of industries, each consisting of twelve representatives of management, labor, and the public, with an independent chairman. These groups had the task of examining the various schemes and suggestions put forward for improving the organization, production, and distribution methods of their respective industries, and of reporting on the steps which should be adopted in the national interest to strengthen the industry and render it more stable and more capable of meeting competition in home and foreign markets. Their reports have constituted nothing less than plans for the renewal of the industries, and very far-reaching recommendations have been adopted from them. (The report of the Cotton Industry Working Party, for example, is remarkable evidence of what can be achieved by rational consideration of the state of an

<sup>50</sup> Douglas Jay, former University teacher, author of *The Socialist Case* (London, 1936).

industry. It is of first-class importance to students of planning as an exhibition of method in studying its subject—it is a high and conscious exercise in foresight.)

The Industrial Organization Act of 1947 implements the activities of the working parties. It applies to industries which are not to be nationalized because it is deemed that private enterprise is better able to conduct them. It enables the minister, after consultation with the workers and employers organizations, to establish a development council for the industry with the object of increasing its efficiency and productivity. The order establishing such a council requires parliamentary endorsement. Where no council is established, the minister may make a levy on the industry for the promotion of scientific research. These councils are designed to carry into effect the recommendations of the industrial working parties.

*Survey of Auxiliary Bodies.* Thus, the British cabinet is surrounded by expert help channeled directly to it, or to its committees, or to individual ministers who can thereupon better contribute their own and their department's part to the knowledge and sagacity required by the cabinet. Continuously, an ascending stream of figures, facts, interpretations, forecasts, will-creating and will-created probabilities, sifted and reflected upon, reaches the cabinet, where decisions are made or the raw material of decision is converted into recommendation and command. Continuously descending from the cabinet, through its departmental assignments and through its committees, flows a general commitment of will and policy, initiative and determination on the course to be followed, but asking guidance, advice, and the facts which settle the bounds and pace of the possible.

It will be observed that the planning system is different from politics like the French and the Weimar German which set up economic and social councils. Also discarded were proposals like that of Sir William Beveridge for an economic general staff, a body of planners outside the departmental scheme and outside the cabi-

net to develop and hand on a plan to the government as the executant. Statesmen were rightly skeptical of an arrangement which would vest a planning function in a group of men who are not inside the administrative organs, not saturated with detailed knowledge of operating possibilities, not responsible for final decision and responsible execution.

The various bodies that have been described as offshoots of the cabinet or as created by it to offer assistance from outside are in continuous, busy, and intermeshed operation—the drive coming from the cabinet, the ministers, and the House of Commons urging on by exhortation, alternative proposals, questions, debate, and storms.

Thus, the cabinet arrangements in the center of the system may be visualized as a pyramid.<sup>51</sup> At the summit is the prime minister, acting through the whole cabinet and his chairmanship of the Economic Policy and Defense Committees. For his assistance, he is flanked by three ministers—the Chancellor of the Exchequer, the Lord President of the Council, and the Foreign Secretary. These, again, marshal the activities of other cabinet and non-cabinet ministers through committees, ministerial and administrative. There is both devolution of work and responsibility and integration of mind and objective. The system is to a considerable extent the result of Mr. Attlee's own personal interest in efficient government—a not unwelcome testimony to the value of early years as a political scientist.

Yet it is urgent that the fact that the prime minister is "at the summit" be not construed as above and superior to his cabinet colleagues: he is one with them.

*The Neutrality and Anonymity of the Civil Service.* If the civil service were to change with every government, dire confusion would follow upon every assertion of the principle of responsibility. Even in the same party some members are elderly and tired; and some are trustworthy, but not undeniably bright. One

<sup>51</sup> Cf. discussion in Francis Williams, *Socialist Britain* (New York, 1948).

thing or the other: either responsibility and neutrality—or a political civil service and an inefficient, indeed, chaotic administration.

Cabinet ministers are not usually experts in the field of work of the department to which they are assigned. They may be accidentally; but they are not chosen purposely for expertness. Rather are they chosen because they have for long shown a special interest in and aptitude for that field. Yet their career has been parliamentary, not professional. They must rely on the advice and managerial assistance of the civil service officials: that is, career men who have mastered the details of their departmental business by many years of exclusive application. On the one hand, ministers are supposed to be aware of all the activity that is going on in the department, its operations affecting millions upon millions of people all over Britain, and, so far as some departments are concerned, beyond the seas. The officials must be given direction and impetus, in accordance with the statutes giving them their scope, and thus fulfilling the will of Parliament. On the other hand, the minister needs a body of experts to advise him on the proper, the most efficient, and least expensive way of defining new policies and embodying them in statutes. To render these services, the indispensable instrument is the civil service.

At the top of each department, then, stands the minister and one and sometimes (but rarely) two undersecretaries from his party. This constitutes the entirety of the political direction and office-holders. Immediately below these stands the permanent secretary of the department, the head of the pyramid of public servants. The crucial relationship is that between the political chief and the permanent chief. It is founded on two conventions: neutrality and anonymity.<sup>52</sup> By *neutrality* is meant impartial service with equal loyalty rendered to any chief of whatever incoming political party. Such loyalty has, al-

most without exception, been accorded to the political parties by the British civil service. It requires of the civil servant that he exercise all his talent and intellectual gifts and that he use appeal (not force) of character to advise his minister on the value to the nation of the minister's declared objectives and yet to yield to him when that objective has been decisively fixed by the former. Beyond this, it requires that the permanent officials advise the minister on alternative ways and means, and further, propose to him objectives and methods he has not thought of. Behind the permanent secretary looms a vast staff which is master of the human and natural and social sciences the minister needs for the fulfillment of the trust committed to him.

On pain of sure disaster, the minister must listen to and heed his secretary's advice. He will not readily do so unless either (a) he is convinced of the loyalty and impartiality of the permanent staffs, or (b) he can bring in with him his own trusted experts. If the system allowed the latter alternative, the magnificent benefits of career non-party experts would be lost. It is essential to be sure of the former. Their training at the universities, their life-long nurture and immersion in the British political tradition, their existence as citizens among other citizens have combined to support such official impartiality. Some men may sometime have been under strain of conscience and temper on this account: but with almost negligible exceptions, all have rendered the nation the inestimable service of completely faithful assistance to the ministers. The direct evidence of this is overwhelming. But if a recent expression of it were necessary, no one is in a better position to express it and to be believed than Lord (formerly Sir Maurice) Hankey, first secretary to the Committee of Imperial Defense and the cabinet secretariat, posts held with consummate distinction for over twenty years. He said:<sup>53</sup>

<sup>52</sup> See for fuller analysis, H. Finer, *The British Civil Service* (London, 1937).

<sup>53</sup> Cf. *Diplomacy by Conference* (London, 1946), p. 16.

The permanent head of a great department of state is on almost the same footing of intimacy with his political chiefs as they are with one another. Ministers talk before them with the same freedom as they do with their colleagues. These men would sell their souls before they would sell their chiefs.

Yet, some critics who have been worsted by Karl Marx's suspicion that men cannot be impartial, but must fatalistically follow only the line of their personal economic interests, have set forth theses tending to throw mistrust on the general observance of the convention of neutrality. They have pointed to the fact that many of the top civil servants in Britain are from the upper-middle and the upper classes and from the older universities. This still, despite an increasing tempo of change, is true. But the conclusions drawn from this outward-seeming truth (a stereotype, as Chapter 14 on public opinion has explained) are crassly false. The cry of "representative" bureaucracy has been set up; it implies that if the officialdom of a nation is not to a large degree representative of the class strata within it, it cannot be loyal to the interests of the less privileged groups, and, specifically, would not properly serve a Labour government.<sup>54</sup>

These ideas demonstrate the misfortune of judging the plain observable facts through the abstractions of a transcendent theory of history. The civil servants of Britain at the top of the administrative summit could not be disloyal to ministers for several plain reasons. First, if some tendered wrong advice, others would find a way of reaching the minister. *Sieve number one.* Second, the unfaithful would fear being detected in the course of time as the source of erroneous policies: their general professional reputation would suffer among their own colleagues. *Sieve number two.* Third, the minister is watched, as we have narrated, by his cabinet colleagues: if the civil servant deceived the minister, he could hardly deceive the cabinet: that is a fully delibera-

tive body, with something of a counter-check in its own cabinet secretariat. *Sieve number three.* Fourth, if the cabinet let a mistake through, the sieve of House of Commons questions stands peremptorily to sift out nonsense. Let it be remembered that the close assistants of the permanent chiefs are present outside the bar of the House in attendance on the minister during question time—they suffer palpitations of the heart as well as he. *Sieve number four.* Finally, the press has its representatives on the spot, and the parties have their own research institutions—*sieves number five and six.* The whole house of gaudy Marxian cards blows down!—for it is not political science! Moreover, if a Labour government's policy is being pondered, one other consideration is of the most significant weight. A Labour government gives the administrators something to administer. Is it to be supposed that men who have devoted all their lives to housing, or town planning, or road construction, or economic planning, or currency and credit affairs, are prepared to sabotage their own opportunity of creative work at the apex and approaching end of their own careers, when here at last is something splendid to build? something to do? a memorial to be won?

British civil servants are *anonymous*: that is, their names are not brought into debate as the inventors or executors of policy. This insures that their voices will not be lifted in advocacy or denigration of policies. If they came into the public light, they would be favored by some politicians and hated by others. They would lose a reputation for impartiality; and their advice—and soon they themselves—would necessarily be discarded. It is rare indeed that a civil servant's name comes before the public. This means that all responsibility, all praise and blame, are concentrated on the minister and the cabinet. The line of responsibility is not obscured or confused. It is the minister who will be shot. To avoid this fate he sees to it that his permanent staff do their job properly. They understand it, and he understands it: consequently each appreciates the qual-

<sup>54</sup> Cf. J. D. Kingsley, *Representative Bureaucracy* (Antioch, 1943).

ities and compulsions of the other, with humorous and cynical lapses. They are not punitive to each other. They do indeed collaborate in a very honorable, pleasant, and fruitful fashion: someone once said as the Victorian wife devotedly served her husband—they never quarrelled in public—while the wife was never insulted in company by her husband, nor did she ever let her lord and master know that he was anything but perfect.

When a minister knows that he cannot put the blame on his civil servants, he is stimulated to judge their advice independently and carefully, and to insist that they shall do their best. That he is answerable to Parliament causes him to insist that others shall be answerable to him. Further, the efficiency of representative government depends upon the use of the expert knowledge of the officials; and only the belief that the advice they tender is scientifically impartial and not suspiciously biased will induce ministers to rely upon it and come fully under its influence. Thus, let it be noted, how upon the highest council of the nation—the cabinet—there is brought to bear the expertness and coordinating advice and assistance of the administrative class of the civil service. In 1939 they numbered roughly 1500: in the aftermath of World War II—a new world—nearly 4000. In this relationship of cabinet and administrative class resides the virtue of the British constitution. (In the United States, the *Report of the President's Committee on Administrative Management* declared in 1936 that the President needed help, and proposed six aides for him, and three units—fiscal, planning, and personnel—to tether all the government to him. It was hardly enough.)

#### PARTY ACCESSORIES TO THE CABINET

THE simultaneous spread of the democratic theory, with the emergence of the leaders of a party above the rank and file of the ordinary member of Parliament, has resulted in more or less systematic attempts of the rank and file to assert themselves against the cabinet. In the Conservative party this has shown itself, from

time to time, by the formation of "die-hard" or "ginger" groups, and these have attempted to drive the cabinet along the path of the "true" Conservative tradition, which seemed to get lost in the necessary compromise and concessions of parliamentary life, and in the ever-present consideration that, while a firm, bold policy is most desirable, it may cause such a loss of votes at the approaching election that the power to do anything at all will be taken away. The party leaders found no great difficulty in bringing members to heel, for loyalty to leaders is a strong element in the party of authority.

In the Labour party the matter has been more embarrassing. Upon the assumption of office in 1929, the usual practice of periodical meetings of the executive committee and the party became impossible, and its place was taken by a "rank-and-file" committee. But it is most interesting to observe that its intervention came practically to nothing, for as the cabinet is the only body in the state which can really appreciate the pressure of necessity in the business of government, and since urgency is always an overruling plea, the cabinet finds itself able to convince the rank and file that they must give way, and they do. Moreover, the country is normally on the side of the cabinet, which *does*, rather than of Parliament, which seems chiefly to *talk*. Yet it is good that the cabinet shall be conscious of a lively following, for that is one of the ways by which it is compelled to pay attention to the comparative rightness of its own, its followers', and its constituents' suggestions. When the Labour government of 1945 began to operate, the party set up a small liaison committee between rank and file, the leader of the House (Morrison), and the whips. But also no less than twenty party groups, one for each main branch of government, were established for the same liaison purposes.<sup>55</sup> They frequently meet to interrogate the minister. Their chairmen are experts, and men of demon-

<sup>55</sup> See Annual Report, Labour Party Conference, 1946.

strated independent character. One peer is included in each group.

#### THE "SHADOW" CABINET

THE opposition has gradually developed an organization to grapple with cabinet leadership, an organization not so good as the latter but good for its purposes and for the efficiency of the system. The former cabinet ministers form what has variously been termed the "ex-cabinet," or more recently the "shadow cabinet." From time to time it has been disputed whether the leader of the party, be he a former prime minister or a newly chosen person, shall consult only former cabinet ministers or shall take council with others. Practice naturally varies from leader to leader. In the Labour party the matter is decided by the periodical elections of the parliamentary executive, though others are not thereby excluded from nonofficial council. Elsewhere, though the "inner cabinet" and other strong members constitute the acknowledged group in the "shadow cabinet," the circle is not absolutely exclusive. Mr. Churchill's part voluntary, part obligatory exclusion from Mr. Baldwin's "shadow cabinet," following differences upon Indian policy, is an interesting example.

More important is the plain fact that the opposition feels the need for permanent organization and council. Nowhere has the necessity and value been so well recognized as in Bolingbroke's *Spirit of Patriotism*. The doctrine is perfect. There were times when the opposition was practically without a concerted lead, when it fell to the strongest and ablest to lead as he wished or to be sniped at by the rivals in his own party. Those days have departed forever, for the immense public benefit of an organized opposition has been fully recognized. The opposition of one day will be the government of the next, but the condition is that it shall maintain its identity and appear always with an alternative program, which will be regarded by the electorate as a pledge. The coming elections must be prepared

for as carefully as the government itself prepares for them, and sails trimmed to arrive at the desirable port. Then, the issues in government have become so obviously the apportionment of power, rights, and duties among contending social groups that a restraint upon the cabinet is plainly seen to be more necessary than before, and in order to restrain, it is obligatory to act according to plan, and systematically to match strategy to the opponent's attack.

These things impose a "shadow cabinet": something which shall continue the policy of its former and more powerful self, think and create in preparation for a fresh tenure of office, make commitments to the public for the future,<sup>56</sup> and meanwhile use the authority and strategy of a united body to obstruct, humiliate and bind the cabinet of the day. It cannot rely, as the cabinet can rely, upon the aid of the departments of state, except when this is embodied in published parliamentary papers and the information evoked by parliamentary questions and debate, but it has a substitute in its party-headquarters research department and the occasional help of paid experts. It is in constant touch with its chief campaign managers, the propaganda sections, the constituencies, here stalking cabinet ministers and replying to their speeches *seriatim*, and now and then meeting the party in conference. Moreover, the "shadow cabinet" arranges debate, entangles the cabinet, probes it here and there, discredits it, obtains electorally dangerous admissions, treats with the government whips for time and closure, and, when the cabinet is a minority government, forces concessions and imposes amendments. Finally, its rank and file are thus held together, given consistency and direction, and imbued with a united and vigorous spirit.

So far has the opposition become a regular institution that it has been dubbed "His Majesty's Loyal Opposition," and its leaders, of course, receive a correspond-

<sup>56</sup> As when in May, 1947, the Conservative party pamphlet *Industrial Charter* committed the party to the continuation of the nationalized services as at that date.

## WEAKNESS AND DIFFICULTIES OF THE CABINET

ing recognition—being asked to social functions by court and people and being consulted by the government when national and imperial issues require a united front, especially on questions of national defense. All this is governmentally good, but even better is the omnipresent, compelling, stimulating effect upon the cabinet: if it is true that this may in the last resort appeal to the people, it is equally true that the appeal cannot but be in part dictated by the opposition. In 1937 the importance to the state of organized and loyal opposition was recognized in the Ministers of the Crown Act, when, as in Canada<sup>87</sup> since 1905, a salary of £2000 a year was provided for the leader of the opposition. Mr. Baldwin argued that this financial endowment would protect and encourage the independence of the leader. Others were afraid it would lame him, make him acquiescent, almost a civil servant! Mr. Baldwin's view is right.

### WEAKNESS AND DIFFICULTIES OF THE CABINET

*The Burden of Work.* We have already mentioned the unfortunate effects of the large size of the cabinet upon the ability of each minister to participate effectively in the formulation of policy. Yet the amount of work to be done by the cabinet and the tremendous burden upon each minister—departmentally, parliamentarily, electorally, and socially—have the further tendency to foreclose any thought beyond the immediate tasks. The period of office is a period of practical work, not of reconsideration and creative survey. One minister has impressed me with the burden borne by him and his cabinet colleagues now that, in addition to departmental, parliamentary, and cabinet duties, preparation for and attendance at cabinet committees is necessary. Hence the special importance of the secretarial and planning assistance to the cabinet and the continuous deliberations of political parties.

*Necessary Trips Abroad.* Other burdens now raise difficulties. Participation in world affairs imposes upon several ministers (the prime minister, the Foreign Secretary, the Colonial Secretary, and the Chancellor of the Exchequer) rather long occasional absences from the country or from current domestic business.

*Personnel Difficulties due to the Party Process.* Cabinet ministers must have won their way upwards in Parliament, and, as we have suggested, in that ascent the party rivals engage in a mutual scrutiny of each other's qualities which is altogether uncasing in its minuteness and intensity. For the public good it is salutary in the highest degree. Yet the path to Parliament and thence to the cabinet is that of popularity—if not with the whole electorate, at least with one or other of the various groups supporting the government, of which prime ministers are sensitively cognizant. Hence the amateur who obtains office is not always a gifted amateur. Compared with the abilities of some men who have never ventured into politics at all, and certainly of experts at large, he may be singularly mediocre and worse. Weak men, incompetents, are sometimes appointed to office or to inappropriate departments, out of such considerations of popularity, sometimes gained and faded a decade or more ago, or through the personal esteem or friendship of the prime minister.

Further, while it is true that the average age of cabinet ministers at entrance in the cabinet is about fifty-five,<sup>88</sup> some cabinet ministers, and certainly some prime ministers, are much older—in their sixties and seventies. Being the seniors of their party they are automatically called in to form cabinets. But as the biography of Neville Chamberlain has conspicuously shown, they are physically ailing far beyond the demands of office in our time. For the task is devastatingly heavy: attendance in Parliament, speeches in one's constituency and in the country generally, participation in party confabulations

<sup>87</sup> For the Canadian experience see R. M. Dawson, *Government of Canada* (Toronto, 1947), p. 396 and *passim*.

<sup>88</sup> Cf. Harold J. Laski, "Personnel of the British Cabinet," in *Studies in Law and Politics* (Yale, 1932) p. 195.

and conferences, and contribution to the work of cabinet committees—the last of an exacting kind. A man of fifty-five, in good health, has the experience ripe for affairs of state, without the weaknesses of age. As age mounts beyond that, by no means all cabinet ministers have the energy and stamina required for their duties, though they may have the wisdom and judgment. This can be a penalty which offsets the need and advantage of ministers' having served an apprenticeship in the House of Commons and having been responsible to it. In the second year of its office, the Labour government of 1945 found it essential to reconstruct, leaving out some of its aged incubuses, and bringing in several very young ministers.

*The Power of the Threat of Dissolution.* Some of the spontaneous and valid creativeness of the House of Commons is dissipated by the threat of the cabinet to dissolve if it is overcome upon a matter it deems vital. Now this point has been falsely overstressed. It has been phrased as though the cabinet were in the habit of letting the House know that it will definitely dissolve upon such and such provocation, as though members were coerced only by the thought of their election expenses. This is not so. The operation is much more subtle, and sometimes unintentional. It operates thus: when the cabinet lets it be known that a matter is vital, by sending out strong whips, not only its own recalcitrants are compelled to take thought, but the formal opposition must seriously consider whether the issue is really big enough for an electoral contest, and whether they are likely to be able to take over the government. If, on the whole, the political position is not quite in their favor they are likely to yield ground, wholly or in part. In short, each issue is determined not by the objective goodness or badness of the policy, but by whether the opposition can successfully carry the matter in the country, and this depends on (a) the nature of the issue itself, (b) the general state of political opinion in the country, and (c) the condition of the finances and organization of the party for the coming fray. But these

matters hardly arise where the opposition is in a minority (which in the last two generations has been almost always) or unless the government party is likely to split (which is very rarely). Hence the opposition cannot do more than obtain that effect upon government policy which its debating talent, the reasonableness of its argument, and the calculation of favorable electoral chances, conspire to give.

*Unwieldy Size.* We have already observed (p. 577) that the British cabinet is a rather large body. It is half as large again as French and German cabinets. It is too large, it has often been said, for prompt and effective discussion and decision. This is true: one hand knows not the charity performed by the other. In default of devolution, the only feasible remedy seems to be a regroupment of the ministries into eight or ten, each with an adequate number of undersecretaries. To a ministry thus composed these could be added up to four ministers without departmental responsibilities. But good committee organization within the cabinet and its auxiliaries can overcome the unwieldiness of too large a cabinet. The use of ministers without departmental responsibilities—the Lord President of the Council and the Lord Privy Seal, almost sinecures—is in operation. As already shown, the cabinet in 1947 had been reduced to sixteen.

It is sometimes deplored that the system we have described divides the country into a set of men who strive their utmost to get things done and another set who do their utmost to obstruct them. Thus Shaw and Wells, men for whom I have a religious respect. I understand the urgency of their complaint—they wish the rotten foundations and the ugly and deceiving façades to be swept away at once. So do I. But the parliamentary and cabinet system springs from the loins of ordinary human beings, and their ultimate demand is the amplest liberty to do as they like and restrain others from doing as others like. This wish, when organized, is the democratic theory, and its organized practice is the party system, and cabinet gov-

ernment its natural flower. Are we so sure of ourselves, and the wisdom and goodness of the intentions of others, that we can surrender the right to obstruct?

On the whole, with the exceptions here and there noticed, the British cabinet system offers quick, vigorous, thoughtful, and responsible leadership; it is controlled, but not stultified; threatened, but not executed; questioned, but not mistrusted; politically partisan, but not personally malicious; restrained as much by the spirit of responsible power as by its institutions and sanctions; and Januslike, it looks at once out to the far-flung people and through the corridors to the gathered, exacting senate.

The cabinet controls (on terms and during its good behavior) the law-making assemblies, the making of law, the timetable of the Commons and the Lords, the Parliamentary committees, the making of executive rules and orders, the estimates, the taxing power, the public corporations—all on the terms that it satisfies the legislature, which normally, it is sure to do because cabinet and legislature are one. What it plans it can do: what it legislates

it can find money for: what social benefits it decides should be bestowed on groups of the population come within its administrative gift: what coercion is necessary is lent to it by the legislature. It is master of the whole administrative apparatus. There are no hybrids like the independent regulatory commissions in the American system, and all the departments come under the vigorous swing of the cabinet. It is rock-like in its stability compared with the French cabinet under whose aegis the Monnet Plan is carried forward. It is umbilically tied to the people, as contrasted with the Soviet planners who tie their people noose-like to their own self-willed convictions. In plan-formulation and plan-execution it is the supreme engineer, compact of responsible will and dynamic initiative, epitomizing knowledge and the general good, and driving the plans home through the civil service.<sup>50</sup>

<sup>50</sup> For an inside view of the cabinet, the reader should compare David Lloyd George, *War Memoirs* (London, 1933); Winston S. Churchill, *The World Crisis* (London, 1923-28); and same author, *Their Finest Hour* (New York, 1949).

## *The French Cabinet*

THIS chapter analyzes the French cabinet system as it operated during the Third Republic; indicates its weaknesses and ultimate collapse in the military defeat of 1940 and the attempts to cure those weaknesses in the interwar years; and examines the provisions of the 1946 and 1958 constitutions.

### THE EXECUTIVE IN THE THIRD REPUBLIC

In France, the effective executive of the Third Republic was, as in England and Germany, the direct issue of the parties as in Parliament assembled. The chief of state, the President of the Republic, was more than a figurehead, but not much more. The brunt of government was borne by the cabinet, or, as it is called in France, the *Conseil des Ministres*. As we have already seen in the case of England and shall in the United States, the efficiency of the executive is governed by the combined effect of its legal power, its conventional attributes, and its party and personal composition.

Cabinet government based fully upon parliamentary consent came only in 1875, with the simultaneous institution of ministerial responsibility to the chambers and the establishment of a nonhereditary chief of state, elected by the chambers for a short term. The constitutional laws of the Third Republic provided (1) that every action of the President of the Republic must be countersigned by a minister; (2) that "ministers are collectively responsible before the chambers for the general policy

of the government, and individually for their personal acts"; (3) that "the President of the Republic is not responsible for anything except in the case of high treason"; (4) that "the President of the Republic communicates with the Chambers by messages which are read at the tribune by a Minister"; (5) that "Ministers have the entry to both Chambers and may speak when they wish to," and they may make use of the assistance of commissioners designated, for the discussion of a specific project of law, by decree of the President of the Republic; and, finally (6) that a law declared urgent by both chambers must at once be promulgated, but that within the normal time before promulgation, that is, within the course of the month following the transmission of the law to him, he may require a parliamentary redeliberation of the law.

*Responsibility.* The constitutional laws of 1875 were the first since the Revolution to make clear that the responsibility of ministers meant principally political responsibility. Previous constitutional law and theory had not clearly distinguished between penal and political responsibility, nor had the former been decisively relegated as a minor and rare incident of office.<sup>1</sup> What, then, did political respon-

<sup>1</sup> Cf. Leon Duguit, *Traité de Droit Constitutionnel* (Paris, 1925), Vol. II, and E. Pierre, *Traité de Droit, Politique et Parlementaire* (Paris, 1922), Vol. I, para. 105.

E.g., the constitution of 1848 provided: "In all cases of ministerial responsibility, the Na-

sibility mean? As in England, it meant nothing more than that where the matter was sufficiently serious, a minister would be deprived of the power to pursue a political career, because the chambers would withdraw their confidence and the electorate might not return him. The attempt to find a more precise meaning failed, although the Chamber of Deputies once attempted to invest it with serious meaning.<sup>2</sup> The result has been a rather unsettled relationship between the government and the chambers. Pierre said it meant that the government must hide nothing from the chambers, that these had a continuous right to control and modify its policy and administrative activity. He did not, however, think that the cabinet should fall whenever one or some or all ministers displeased the chambers. "The question of confidence, which is distinct from that of responsibility, does not arise unless the Government considers that it would be dangerous not to attempt to make its own will prevail." This is only the French equivalent for the English insistence that the government need resign only on vital matters. Pierre said that the minister ought to stay in office unless he has been directly and gravely repudiated, but until that point has been reached, an adverse vote should be followed by bending, but not breaking. He was constrained (by events, I am sure) to admit that the principle of collective responsibility as it operated in France did not preclude a cabinet from permitting one of its members from speaking and voting in a sense different from that held officially by the cabinet. Thus in 1904, Combes, president of the Conseil, explained to the Chamber that there was nothing wrong in a difference between two ministers:

I do not think that it is to be imagined that *x* and *y* in consenting to join the same Cabinet

tional Assembly can, according to circumstances, send the inculpated minister either before the high court of justice or before the ordinary courts for civil compensation." The constitution of 1875 abolished ministerial solidarity and provided for the minister's responsibility to the chief of state only.

<sup>2</sup> See Pierre, *op. cit.*, Vol. I, para. 107.

thereby repudiated their life-long doctrines. The Cabinet does not pretend to realize an absolute homogeneity. . . It pretends to reflect very exactly the republican majority of this assembly composed of four groups each of which professes divergent opinion on certain points.

That was almost the exact opposite of responsibility as it is known in the British system; for there it is pretended that unanimity exists, and the pretense is founded upon a reasonable expectation that men of one party, though of different shades of opinion, may by lifelong cooperation and mutual loyalty arrive at the unanimity and common will of a compromise.<sup>3</sup> We shall see that in France certain conditions made this presumption quite impossible and that, in fact, political practice virtually deleted the words "collectively responsible" from the Third Republic constitution. The question now is, what conditions governed the operation of these clauses? Four stand out in the highest relief: (1) the cabinet had no power to dissolve Parliament; (2) the chambers were composed of a multiplicity of groups; (3) the Senate demanded ministerial attention since it might have troubled, if not overthrown, a cabinet; and (4) the commissions were rivals of ministers. We must now examine what these conditions imply.

*No Cabinet Power to Dissolve the Chambers.* The constitution gave the President of the Republic the power to dissolve the chambers before the expiry of their legal term, provided he could obtain the assent of the Senate to such a policy. This article was dictated by the monarchists' desire to secure a strong, if not a monarchical, government and to make the President and the Senate forceful counteragents to universal suffrage and the Chamber of Deputies, while the republicans saw in the Senate a check upon the arbitrary use of the power of dissolution by the executive. But the first attempt to use this machinery, on May

<sup>3</sup> Cf. Walter Bagehot, *The Character of Sir Robert Peel* (London, 1856), in *Works* (Longmans, 1915), Vol. II.

16, 1877, by the royalist President, MacMahon, was so shockingly against the contemporary sentiment of the country that it was never repeated. Nor is that all. Parliamentarists were able to persuade the electorate, and, of course, themselves, that the power of dissolution ought not to be used. The motive of the deputies was obvious; they wished to retain their seats as long as possible and to act against any government, as they wished, with electoral impunity; and they were able to sustain this desire by the argument that the chambers represented the sovereignty of the nation. This again was sustainable by mere reference to the *Seize-Mai*, which produced the habit of regarding dissolution as a *coup d'état*.<sup>4</sup> The possibility of dissolution was never mentioned in normal times; it was no more than hinted at as a faint possibility—rather a fancy—when the dizzy turbulence of the chambers was plainly bringing government not only to a dangerous pass but into contempt. (It received, however, increasing favor from the parties of the extreme Right.)

Let it then be understood that no power of dissolution existed in France. The Chamber of Deputies always lasted its full legal term—four years. The government of the day had no weapon with which to ward off onslaughts, or to attack and disperse a parliamentary conspiracy, even the most factious. The political effects were dire. As factiousness could not be subjugated, sovereignty was thrown into the hands of any group, however small, which any time possessed the balance of power. Two or three men in a key group might decide the fate of a ministry, and even if they did not possess the power to overthrow the government, they might easily possess the power of throwing it into a state of fearful anxiety and of dictating vital changes in its program. Thus the government had the power of neither defense nor retribution. That was

a serious evil, for it meant that the value of its technically informed counsel was wasted for Parliament and the country. It might have been compelled to relinquish its considered policy for the unsifted inspiration of a small knot of willful men.

In 1934, after the February riots before the Chamber of Deputies—an undoubtedly serious attempt on the part of Right-wing groups and fascists to start a revolution—the prime minister, the long-bearded senescent Doumergue, called in to appease the country, proposed various reforms of the constitution. Chief among them was the restoration of the power of dissolution. His radio address to the people on September 24, 1934, stressed the need in view of the short-livedness of cabinets. "The governments may have among them men of ability but it is known in advance that there will be no time to give those men an opportunity to prove themselves, for the majority on which they depend may not be able to continue . . ." He proposed that the consent of the Senate should no longer be necessary for dissolution, except during the first year of the existence of the Chamber. The project was examined by the Chamber of Deputies' Commission on the Reform of the State<sup>5</sup> and, by a vote of twenty-one to three, was recommended with the exception that the President was not to be able to dissolve the Chamber earlier than three months after a general election or after a previous dissolution. Though some years before the Socialist party had favored dissolution, they now joined the Radical Socialists to oppose it in the Chamber. They did not propose to throw away their dominating position in the balance of governmental powers; nor did individual deputies intend to surrender their personal political power. (Tardieu had favored the reform, advocating it in his *L'Heure de la Décision* of January, 1934.) Doumergue was forced from office by dissentients from his proposals. Naturally, the Senate was hostile

<sup>4</sup> Cf. J. C. C. Bodley, *France*, revised edition (London, 1907), pp. 230-31; J. Barthélemy, *The Government of France* (New York, 1924); A. Siegfried, *Tableau des Partis Politiques* (Paris, 1930).

<sup>5</sup> *Bulletin des Commissions*, No. 47, May 1, 1934, p. 2919.

to the curtailment of its constitutional powers. There was some force in the argument of opponents that the cabinet in France could never be strengthened by the power to dissolve the Chamber, because it was inherently unstable, since no party ever came near to commanding a majority. (The provisions of the new constitution on this subject are discussed presently, p. 640.)

*The Groups and the Cabinet.* In France there are many groups, and, by the power to command ten or fifteen votes, a leader may become the dictator of government. In the Parliament of 1924-28, there were ten groups and thirty-one members belonging to no group; in that of 1932, sixteen groups and twenty-six non-affiliated members. No group ever secured a majority in the Chamber; hence, every government was a coalition.

*The Terms of Coalition.* The initiative in the formation of the cabinet had to be and was taken by the President of the Republic. He had obviously a number of choices—the chambers of 1928, 1932, and 1936, for example, contained three possible majorities—and even apart from considerations of policy, which have always moved Presidents in their approach to a ministry, personal preferences also had weight, as with Poincaré and Clemenceau. But the President was concerned to find a practicable government, and his principal anxiety was to discover the basis of a working majority, even if it should not be that which would best meet his own policy. With this intention he conferred first with the presidents of the Chamber and the Senate. This custom began with MacMahon, who actually offered the formation of a cabinet to the Presidents themselves, on the assumption that since they had been elected to their pre-eminent position by parliamentary majorities, they would naturally be able to form a ministry. They refused, but on several occasions the president of the Chamber of Deputies became prime minister. The suggestions of the Presidents were translated into offers made to various party leaders—and in some cases, to certain outstanding men who belonged to

no party at all—to form a government. These leaders, who were often without any organized party following,<sup>6</sup> consulted with friends to discover where the greatest strength compatible with the longest time in office was to be sought: was it entirely on the Left, or would it be among the moderate groups, or must an attempt be made to induce a Right group to co-operate with the moderate Left? The chairmen of the Foreign Affairs and Finance Commissions were consulted by the President of the Republic and the aspirant prime minister, to give light, and sometimes weight, to their quest. Then the groups were approached. These were not usually engaged by their leaders, but held a meeting to determine their attitude. They had various things to consider: whether they wished to serve with this particular person at their head; whether, accepting his person, they could accept the policy; whether, accepting these, they could cooperate with the other groups of the "combination"; and further, whether the number and importance of the ministries and under-secretaryships were satisfactory. One section—the Socialist party—never accepted office to 1936, but was asked for its engagement to vote with the government, or to abstain on certain occasions, in return for hostages of policy.<sup>7</sup> Nor was this all: the creator of the cabinet was careful to include as few small

<sup>6</sup> E.g., in 1914 Briand was not inscribed in any group; in 1919 Millerand was a *sauvage*; and even Poincaré and Laval might fairly be included.

<sup>7</sup> Cf. Maurice Privat, *Les Heures d'André Tardieu* (Paris, 1930), for an excellent analysis of the various changes of government in 1929-30. Cf. also for the relationship between Radical Socialists and Socialists, Edouard Herriot, *Pourquoi Je Suis Radical Socialiste* (Paris, 1923). Cf. also Georges Suarez, *De Poincaré à Poincaré* (Paris, 1926), and L. Marcellin, *Politique et Politiciens* (Paris, 1928), 4 vols., and *Voyage autour de la Chambre* (Paris, 1925); J. Barthélemy and Paul Duez, *Traité de Droit Constitutionnel* (Paris, 1933); V. Haikal, *Le Président du Conseil* (Paris, 1938); A. Soulier, *L'Instabilité Ministerielle, 1871-1938* (Paris, 1939); E. Girard, *La Crise de la Démocratie et le Réinforcement du Pouvoir Exécutif* (Paris, 1938); E. Berl, *La Politique et les Partis* (Paris, 1932).

groups as possible, for the larger the number of included groups, the greater the compromise on principle, and the larger the number of joints, the greater the fear and prospect of fissure.

Now, if two conditions had been present, the "concentration" cabinet (or the *combinaison*, as it is called) would have sufficed and would have lived a long time compared with its actual length of life.

The conditions were, *first*, that the groups should enter the combination as one man, and *second*, that they should remain faithful to the combination. Neither of these conditions existed, and neither could exist. The first did not and could not exist because every group contained dissentients, who would not follow their leader's person or policy, or who sought their own advancement by the overthrow of one ministry, hoping that the formation of a new one would find them more favorably placed to dominate or command office. The fact was that the conventions of party loyalty were not accepted in France, as they are in England, owing to the inability of the deputy to subject himself and his special convictions to public policy as interpreted by common consent. There was no way to force him into a state of discipline since dissolution was impossible: hence Jacques could always find an argument to prove that he was as good as his master. Nor did the vote of the group, whether it was unanimous or split, reveal the true state of mind of the groups: nor did it afford a guarantee that in other circumstances the conditions of today would be accepted by the same number. It was a fact well known, also, in all parliaments that men sometimes rise by intransigent opposition, while when they faithfully follow the government they are expected to be silent and supine.

Nor could the coalescing part of the group be relied upon for long. The full difficulties of a program could not possibly be adumbrated in the few days of cabinet making, and as soon as they became patent in the course of the cabinet discussion, the signs of a rift appeared. Further, the coalition could not control

the future; at any moment an anarchist might throw a bomb, a bank might fail, an army or civil service or Stavisky scandal might be unearthed, a cruiser might sink, a clash between army or naval forces might accidentally occur thousands of miles away, riots might occur—and a new question of principle would suddenly be thrust upon a cabinet of many jointed pieces, and a hungry, tumultuous, and theatrical assembly. No original loyalty held the French cabinet together: it was the adventure which did all, or failed; and it failed too soon.

*The Opposition.* The opposition was quite as badly organized as the cabinet. It had no such recognized authority as in England. It was composed of a fortuitous junction of heterogeneous, often bitterly hostile, groups. The cabinet suffered all the defects of being the result of concentration, but at least it concentrated groups more approximately likeminded than the opposition. There was, of course, no single opposition, but several opposition groups, and they became one opposition not by combining, but by converging. And then, having attained a kill, they diverged. The government was therefore faced by no consistent and regular machinery of criticism, but by irresponsible lethal attacks from all sides. For the attackers could not be sure that they themselves would form part of a government; and if they could be sure of this, they could not be confident of the policy in which they would be engaged. Hence their criticism was not tempered, as in England the opposition's criticism is tempered, by the thought that it might one day have to be justified by practice. A premium was placed upon exaggeration and incitement. It was never a responsible commitment. Nor was that all. The opposition, as a single body, was only a momentary phenomenon and disappeared at the precise time when the President of the Republic might desire to call it to office. It was often only a few votes (hardly a score) more powerful than the government it had overthrown; scarcely able, even if united, to govern. The groups, however, were back in their respective

camps as self-righteous as could be, and some of them could not possibly hope to form a new government, while some of the old groups must remain in the next combination.

*Short-lived Cabinets.* The result was, of course, ministerial instability. Between 1873 and 1940, there were about one hundred cabinets.<sup>8</sup> Each cabinet lived on the average a span of a little over eight months. There were, counting cabinets of less than a week, about ninety-five ministerial and parliamentary disturbances, a condition which has powerfully contributed to bringing parliamentary government into contempt. The instability is better appreciated if we leave out of the average four ministries of great length for France. Thus Waldeck-Rousseau was in office practically three years, Combes over two and a half years, Clemenceau two and three-quarter years (1906-09), and again Clemenceau (1917-20) nearly three years; in all eleven and a quarter years. Table 17 is also revealing.

TABLE 17—FRANCE: DURATION OF CABINETS, 1873-1940

<i>Duration</i>	<i>Number of Cabinets, 1873-1940</i>
6 months and under	50
6-12 months	31
12-18 months	9
18-24 months	1
24 months and over	8

From 1928 to M. Daladier's government of April, 1938, there were twenty-five cabinets, of which only Laval's first cabinet and Blum's Popular Front each lasted a year.

Now, each of these changes of ministry meant no complete renewal of all the offices, for one or more groups stayed in the new combination—sometimes little

<sup>8</sup> These calculations begin in May, 1873, in order to rule out the formative period after the war of 1870; and exclude several cabinets which lasted less than a week, as these were little more than attempts to form a government. The student must overlook some very slight discrepancies: the figures on the same basis are hard to obtain in a single series.

more than the overthrow of a prime minister occurred. Ministerial changes were, in fact, *ministères de replâtrage*, replastered ministries, and the practice of replastering was sometimes called *dosage*, or "dosing" a dying patient. As a rule, between one half and three quarters of the previous ministry served in the new one. This is indeed a mitigation of all the administrative evils which might follow. Yet the consequences are sufficiently bad, as we shall see from a closer inspection of certain statistics. Further, the political facts practically extinguished the phrase of the constitution, that ministries were collectively responsible. There was hardly ever a complete clearance of a defeated ministry. There were frequent individual resignations.<sup>9</sup> It must have been felt that such frequent changes of the whole ministry were too disastrous. Yet these individual resignations weakened rather than strengthened the ministry, and they were often the immediate prelude to a downfall. Once the deputies tasted blood . . .

*Intermittent Premiership.* The value of a prime ministership is lost if the man has not a long and unbroken span of office. In France from 1873 to 1928, there were thirty-eight different presidents of the council;<sup>10</sup> their average length of office was thus almost exactly eighteen months. And there were fifteen more different ones between 1928 and the capitulation in 1940: that is an average service

TABLE 18—FRANCE: TOTAL LENGTH OF SERVICE OF PRIME MINISTERS, 1873-1940

<i>Duration of Ministry</i>	<i>Number of Cabinets</i>	
	<i>1873-1928</i>	<i>1928-1940</i>
Under 6 months	10	7
6-12 months	13	5
12-18 months	3	2
18-24 months	5	1

30-36 months	2	0
36-42 months	1	0
42-48 months	0	0
48 months and over	4	0

<sup>9</sup> Consider especially the succession of Ministers of Finance from 1924 to 1928.

<sup>10</sup> Omitting cabinets lasting less than one week.

of ten months. But some held office for fairly long spells, and recurrently. Table 17 is valid for continuous prime ministership; Table 18 for total service as prime minister.

Further, the prime minister came not as of right, with previous acquiescence of followers and the deference of his colleagues. Much of his time was inevitably spent in attempting to secure a practical supremacy, indeed, merely to keep the cabinet alive!

*The Cabinet's Loss of Administrative Control.* Few men held their departments long enough to make an informed impression about the quality of their activity. Nor were they in office long enough to learn from the results of their own legislation, or to initiate far-sighted policies. We must remember also that French ministries were peculiarly liable to loss of time from practices which are more fastidiously regulated in England—deputations, visits from members of Parliament and members of commissions, etc.—for they had not learned that to be the tribunes of the people is to have in mind the whole people and not to give way to the solicitations of the persistent few. A duty is owed to the inarticulate but it is not paid. And the added seriousness of such a situation is this: that the people and the administrators, finding that the responsible minister can do so little, are tempted to deny the value of democracy altogether, and to suggest the establishment of administrative syndicalism, in which the technical head of the service appears before Parliament and does the creative work which a minister should do—a regular French heresy!<sup>11</sup>

In spite of the palliating argument that upon the fall of a ministry some ministers remain in the next cabinet, there was a serious discontinuity in the headship of departments. Thus for the period 1873 to 1940, some sixty-seven years, Table 19

shows the number of incumbents in the principal departments.

TABLE 19—FRANCE: NUMBER OF MINISTERS, 1873-1940

Foreign Affairs	27	War	41
Interior	37	Navy	42
Finance	38	Justice	55
Agriculture	42	Commerce	52
Instruction	41	Works	55
Colonies	42	Labor (since 1906)	40

Thus the average amount of change varied between once in two and a half years, and once in one and a half years. Moreover, even where there was continuity of office it was with different colleagues, with a different prime minister, and based on a different parliamentary coalition.<sup>12</sup>

*The Senate and the Cabinet.* The Senate was an extra source of difficulty to the government. Governments were overturned by the action of the Senate five times in the history of the Republic, and the government could not get its legislation through the Senate without taking special time and trouble to do so. Further, it suffered interpellations upon its policy in that chamber also. Now, the Chamber of Deputies had secured a primacy over the Senate as a representative of the people, and ministries defeated in the Chamber but sustained by the Senate had no chance of life at all. Though min-

<sup>12</sup> This table does not, however, include an account of the ministries held by prime ministers. J. L. Heinberg (in an article in the *American Political Science Quarterly*, May, 1931, on "The Personnel of French Cabinets, 1871-1930") and counting on the basis of eighty-two premierships, says: "During thirty of the eighty-two terms, the premier has held the portfolio of foreign affairs; during twenty, that of minister of the interior; ten, that of justice; five, that of finance; and he has been without portfolio during four terms."

On the constitutional law of the matter (and this is one more proof of the vagueness of constitutions), Duguit takes the view that the government is as responsible to the Senate as to the Chamber; Esmein that the English practice was intended to be followed and ought to be considered as implied by the French constitution. Cf. L. Duguit, *op. cit.*, Vol. IV, p. 853 ff.; A. Esmein, *op. cit.* (7th ed.), Vol. II, p. 234 ff.

<sup>11</sup> Cf. Henri Chardon, *Annales, Académie des Sciences Morales et Politiques, Sciences et Travaux* (Paris, 1928), p. 361 ff., and Robert de Jouvenel, *La République des Camarades* (Paris, edition 1924), Part II.

istries harassed or defeated in the Senate but sustained in the House might, and did, go on living, there was always the possibility that the obstruction of the Senate (as in 1890, 1896, 1913, 1925, 1930, 1935, 1937, and 1938) might so discredit or disgust a government as to cause its fall. Hence the government in normal circumstances had to walk warily; the question of confidence was put in the Senate ten times between 1896 and 1924, and several times after that in debate.

The government assured itself of support by taking some of its ministers from the Senate; and in this way, too, it secured the help of many capable statesmen. From 1873 to 1940 the Senate contributed twenty-two prime ministers out of a total of fifty-four, and rather more than one out of three ministers. Thus ministries always contained at least two members of the Senate, and often more.

*The Commissions and the Cabinet.* We have already seen (p. 493) that the commissions played a large part in the legislative, financial, and administrative work of government. They contained old and experienced members of cabinets and were the nurseries of future ministers. They weakened the ministers because they were powerful rivals and the chambers looked to them for guidance, whereas in England the sources of inspiration were purely ministerial. Moreover, they were the deputies and senators organized as continuous guilds, and they always acted as prosecuting attorneys and professional defensive societies, towards ministers. They could not see why ministers should arrogate to themselves full control and sole leadership. Ministers were able, therefore, to suggest that the blame for faulty projects, inappropriate administration, waste of time, and tardiness was upon the commissions, and no one could discover the exact truth of the matter. The commissions again, by their power of departmental penetration, were able to prepare the parliamentary defeat of the ministers.

The truth was that France was governed by a parliament in which the basis of action was almost one of unanimous consent, or *liberum veto*, and government

either lived weakly on sufferance or snatched not infrequently at short-term dictatorial power (*pleins pouvoirs*) to carry out the most urgent defenses against financial or administrative collapse. A quasi-advocacy of the commissions—advanced on the grounds that they enabled former ministers to continue work in the field of government they had formerly tended, to control the new ministers, and to keep themselves in training for a return to office—is plausible, but omits the incoherence and vacillation produced by divided authority.

*The President of the Republic.* It is clear that in such a system the President of the Republic may claim and obtain more power than the Crown in England. For he represents continuity against change, and his experience is not lightly to be discarded by the cabinet. There were two types of cabinet meeting: the *conseil des ministres* and the *conseil de cabinet*. The former was a meeting of ministers with the President of the Republic as presiding officer, and it deliberated on policy: the latter met under the presidency of the prime minister and deliberated on tactics: the one was national, the second, parliamentary. In five years the President saw on the average eight or nine governments, as shown by Table 20. The dullest could not have lived without learning, nor could the lessons be without effect upon the ministers. More, if he was a creative statesman like Grévy or Poincaré or Millerand, he could not be without an added influence upon the council. And history shows that the Presidents who desired it were part of the efficient executive of France.

As for the President of the Republic, whose legal term was seven years, he was elected by absolute majority of the two assemblies meeting together. Though eligible for re-election, only two Presidents were ever re-elected for a second term: Grévy in 1885 and Lebrun in 1939. The office was not intended to be strong, and it was Clemenceau who declared that he always voted for the most stupid. Indeed, Clemenceau and Herriot failed of election. The Presidential powers embraced

## THE FRENCH CABINET

the whole of the executive powers, but they were exercisable by the Council of Ministers, with parliamentary responsibility. It was an office of dignity rather than power. But it could be influential, for Presidents like Poincaré could occasionally keep out of cabinet office statesmen like Clemenceau. All had influence in the Council of Ministers, but none against the will of the chambers, and none, even if they tried like Millerand (1920-24), could put up a ministry of their preference against the will of the chambers: Millerand was broken and forced to resign in trying this. But it was

tween two branches: a cabinet and a President. The French tried to overcome this cleft by electing weak submissive men to the Presidency: but the weak can destroy a nation as well as the strong.

*Commissioners as Technical Assistants.* The constitution gave ministers the right to assistance by commissioners during parliamentary debate. This right does not exist in England and cannot exist in the United States in open session, but it is of long lineage on the Continent. It is a very valuable gift to ministers who may have on their benches experts to prompt them, and even to speak in their place

TABLE 20—FRANCE: PRESIDENTS AND CABINETS, 1879-1940

<i>Name</i>	<i>Years</i>	<i>Number of Cabinets</i>	<i>President's Term in Years</i>
Grévy, first term	1879-86	9	7
Grévy, second term	1887	3	2
Carnot	1887-94	10	6 and 6 months
Casimir-Perier	1894-95	1	0 and 6 months
Fauré	1895-99	5	4
Loubet	1899-1906	4	7
Fallières	1906-13	9	7
Poincaré	1913-20	12	7
Deschanel	1920	1	0 and 7 months
Millerand	1920-24	5	3 and 9 months
Doumergue	1924-31	15	7
Doumer	1931-32	3	0 and 11 months
Lebrun, first term	1932-39	15	7
Lebrun, second term	1939-40	3	1

a power available to the President that at cabinet crises he could turn to one rather than the other wings of the Chamber where either was equally able to get support in office. That Herriot tried in 1939 to become President, and that Clemenceau had also tried vainly in 1919, is a sign that according to the character and ability of the man the Presidential office was one of considerable power. This was further demonstrated when the weak, amiable, mustachioed Lebrun had not the backbone to resist Pétain and his colleagues when they capitulated in 1940: he could have resisted, he could have reappointed Reynaud, he could have appointed a noncapitulationist—he tamely resigned. It is better that executive responsibility should not be divided be-

where the technical answer or information is beyond them. In Britain the officials, by simple custom, stand by the speaker's chair and whisper their lifesaving help to the ministers. In France, the commissioner might mount the tribune. The practice of the constitution permitted the help of the commissioner in the case of bills, resolutions, and interpellations. The commissioner was expected not to make saucy retorts in the manner of ministers or deputies; and a respectful demeanor was expected of him. Nor was he permitted to seem to take the responsibility for any action which was the minister's, and the minister, too, was held strictly responsible for all the actions of his department. Further, it was determined that questions must be answered by ministers.

There is an obvious benefit in this practice. It is clear that the expert can deal better with difficulties than the minister, especially ministers so short-lived. The technical nature of many bills has proved a serious strain on ministers in modern legislatures, who have to be coached and are unable to draw on the deep sources of professional knowledge. But there are disadvantages. *First*, it takes away from the dignity of ministers who are often demonstrated to be mere figure-heads. *Second*, ministers are the less compelled to master all the details relevant to a policy or a statute. *Third*, sometimes officials whose actions are in question are brought forward as commissioners to answer for themselves, and though it is true that they know the facts, the minister rather should be at once their cross-examiner and their advocate. Yet with careful limitation the practice should be useful in all legislatures<sup>13</sup>—the limitation being that which in France is aimed at and on the whole, attained (the Fourth Republic continues the practice):<sup>14</sup> that the commissioner is nothing more than the technical assistant of the minister, and never his substitute. In the United States the appearance of officials before the committees of Congress at hearings fulfills the same function—even more effectively.

*An Unorganized Cabinet, and Remedies Applied.* Until 1914 the French cabinet had no rules of procedure, no agenda, no minutes, no secretary. There was even less preparation for its work than in England till then. Subjects were introduced by the ministers or the president of the Council, at haphazard, and were treated by a desultory and usually a tediously long and indecisive conversation. In 1916 Ribot created a secretariat of the cabinet on the model of the secretariat of the war cabinet created by Lloyd George. This was transformed by Painlevé and Clemenceau into an undersecretaryship of state attached to the presidency of the council. This organization brought together infor-

mation for the prime minister and coordinated and energized the work of the individual departments.<sup>15</sup> The organization ceased to be continuous after World War I, depending upon the varying personalities of the prime ministers.

Complaints were many that the cabinet was not equipped appropriately for its tasks. It was suggested that there should be more careful and considered attention to the projects prepared by the ministries and their consultative councils.<sup>16</sup> It was urged that the presidency of the council should be aided by a permanent council which would promote both continuity of policy from cabinet to cabinet and the ascendancy of the prime minister.<sup>17</sup> It was also proposed that the number of independent ministries should be diminished<sup>18</sup>

<sup>13</sup> Cf. *Revue du Droit Public*, 1919.

<sup>14</sup> Cf. M. Lepine, in *Annales, Académie des Sciences Morales et Politiques*, *op. cit.*, p. 339.

<sup>15</sup> Cf. Maxime Leroy, *Vers une République Heureuse* (Paris, 1922), p. 86; Henri Chardon, *Le Pouvoir Administratif* (Paris 1912), p. 407; A. Schatz, *L'Entreprise Gouvernementale* (Paris, 1922), p. 230. See especially P. Duhois-Richard, *Revue du Droit Public* (Paris, 1919), and *L'Organisation Technique de l'État* (Paris, 1930). The author was head of the administrative secretariat of Prime Minister Alexandre Ribot in 1917. In the article referred to, his opinion is as follows: "Even if the Chief of State has wide powers it is still necessary to organize the Prime Ministership and give it a bureau of research and coordination. . . . In the first place, the following question must be answered: what are the tasks to be performed by services under the Prime Ministership? Now on this point, both experience and reason indicate that the first thing is to give the head of the government every means of forming his opinion with a knowledge of all the logically significant points; that the next thing is to secure the execution of the decisions arrived at, with a minimum effort and in a minimum time; obviously, the services which correspond to these two separate aims are of a very different character: on one hand documentation and research services are needed, on the other co-ordination services." Cf. also, M. Dendias, *Le Chef de l'État et le Rajustement de l'Exécutif* (Paris, 1937); P. Lions, *La Présidence du Conseil* (Paris, 1935); and V. Haikal, *op. cit.*

<sup>18</sup> The number of ministries in 1873 was nine; in 1890 eleven; in 1900 twelve; in 1928 (November) fifteen, in the government of Henri Queville, September 14, 1948, fifteen.

<sup>13</sup> Cf. Pierre, *op. cit.*, paras. 641, 642.

<sup>14</sup> Constitution, article 53; *Règlement*, article 44.

to improve collective counsel and provide the opportunity for a more rational, and less minute, division of functions.<sup>19</sup> Some recommended that there should be two cabinets, one composed of the ministers concerned with more "technical" duties and the other composed of "political" ministers,<sup>20</sup> and even that the form of ministerial responsibility should give way to government by a council of permanent officials, organized strictly according to the technical necessities of modern social services and acting with much more independence and publicity than hitherto.<sup>21</sup>

In 1925, a decree sought the creation of a systematic and permanent secretariat to the prime minister. Its work was to fall into four categories, each administered by a special section: (a) preparation for cabinet meetings; (b) centralization and dissemination of economic facts; (c) advice on administrative and judicial reforms; and (d) publicity. Further, other bodies, like the Economic Council, the Council of Housing, and the Council of National Defense, were to be brought into contact with the cabinet. This secretariat was composed of civil and military officials detached from various departments to assure a liaison, and to form the personnel of the undersecretaryship of state of the presidency of the cabinet. But within a few months the whole apparatus disappeared, under Poincaré's prime ministership, for reasons of economy.

If the arrangement disappeared, the need remained. In the wake of the anti-parliamentary storm of February, 1934, Doumergue's reform proposals included the establishment of services of coordination for the prime minister. He said: <sup>22</sup>

You realize that I expect of a well-organized cabinet, with a president recognized by the

constitution at its head, possibilities of governmental action which do not exist today. In my proposal, the prime minister ought to be provided with the assistance of a permanent, selected personnel above all, of small number, brought in from the great government departments. Helped by these services, the prime minister could follow attentively the activity of every ministerial department and could see to it that the one did not burden the other, and that suggestions initiated, activities, and efforts, should be coordinated for the common good. To the prime minister's office, besides the services of central statistics and the general secretariat of the superior council of national defense, there will be attached the reorganized *conseil national économique*.

Doumergue's general idea was carried out by an article of the French budget law for 1935,<sup>23</sup> followed by a decree carrying it out.<sup>24</sup> The article merely prescribed: "The minister in charge of the prime ministership shall have under his direction the administrative services of the prime ministership." The term used constantly is actually "presidency of the Council" and not "premier" or "prime ministership"—a term not unusual in French practice and designed to emphasize the organizing, chairmanship, function of the prime minister. The secretariat or the offices of the prime minister, according to this decree, consisted of a small permanent staff of clerical and administrative officers, and in addition, a floating personnel not exceeding fifteen (later twenty-five) released from their own regular departments for the purpose for each prime minister in turn. From this floating personnel one was appointed secretary-general of the administrative services of the prime minister. It was open to the prime minister to choose persons from outside the government public services to be members of the floating personnel; M. Blum, for example, appointing a university teacher, two former deputies, and three journalists.

The permanent nucleus of the prime minister's administrative services supplied him with material relative to the legis-

<sup>19</sup> Cf. Documents, *Journal Officiel*, 1921, p. 339. *Rapport*, report of Minister of Foreign Affairs; Th. Barnier, *Au Service de la Chose Publique* (Paris, 1926).

lative activity of the Chambers, and took care of his correspondence and of the secretariat's files and library. The floating personnel—organized deliberately on a nonpermanent basis for each prime minister, so that he might be able to choose those whose individual capacity, character, and personality he found agreeable—acted as his general staff or administrative "brains trust," to whom he could devolve administrative missions, while they could relieve him of the burden of onerous high management duties and keep him linked with the various departments, as eyes and ears, and also as arms carrying out his directions. They received, sifted, settled, or passed on, as the case required, the importunities or the mere questions put by deputies and senators and members of the important public, coming direct to the prime minister or sent on by individual ministers to whom they were in the first place directed. Furthermore, the prime ministers used the floating secretariat as reports on specific problems.

In addition to the secretariat as instituted in 1935, the prime minister office had one or two parliamentary undersecretaries. They relieved the prime minister of many of the political duties—such as reception of public delegations, and the fulfillment of errands and commissions concerned in the maintenance of a parliamentary majority—which could be sloughed off safely by the prime minister. Inevitably, he organized the agenda of the cabinet meetings. But neither he nor the secretariat kept or transmitted minutes, or performed the general supporting services to the cabinet as a whole, as the British cabinet secretariat has done since 1916. Perhaps, in the nature of the shaky, short-lived, ill-matched, patchwork, coalition cabinets, that was and is impossible.

The decree of 1936, organizing the administrative services of the prime minister's office, also subordinated certain special agencies of government under the direction of the prime minister, combining their budgets in that of the prime minister's office. These agencies were: the central services for Alsace-Lorraine, the general secretariat of the superior council

of national defense, the national labor council, the national economic council, and the central statistical office.

In spite of this organization, which in itself was wise and sound, though not perfect; in spite of the fact that some ministers held the same office for many years, though intermittently; in spite of the fact that former ministers often continued their activities in the parliamentary commissions—the French cabinet was mortally sick. It gained no strength from the newly established administrative services of the cabinet—a sick cabinet made them sick also.<sup>25</sup> For the prime minister enjoyed no strength of his own: he could not be a good master while he remained the timorous slave of several parties. In addition, it was a steady custom for the prime minister to hold a departmental office, and by no means as a formal chief: over thirty prime ministers held the office of Foreign Secretary; over thirty that of Minister of the Interior; a dozen that of Minister of Justice. It has been exceedingly rare for a British prime minister to hold a departmental office: it is an exception, like that of Ramsay MacDonald, whose vanity and messianic conviction that he could institute world peace impelled him for a time to hold the office of Foreign Secretary. As though the French prime minister had not occupation enough—or, had he, as prime minister alone, sufficient occupation? At any rate, he seems not to have been able to trust any other person to conduct foreign relations, or to govern the electoral and patronage-controlling offices, and the local-government supervising functions, of the Ministries of Justice and the Interior.

Thus, the French cabinet system possessed neither the party stability of the British government, nor the fixed term, if incomplete governing authority, of the American Presidency.

The Third Republic made so brief and inglorious a resistance to the nazi on-

<sup>25</sup> For a fairly up-to-date account by a French life-long observer, see Joseph Barthélemy, "La Présidence du Conseil," *Revue d'Histoire Politique et Constitutionnelle*, January-March, 1937.

slaught of the late spring of 1940 because its political parties had shredded the nation, while the nation, considered as a multitude of individuals, had disintegrated the parties. So much was this so, that firm and stable government was not feasible. The permanent officials could not be controlled and directed, nor their actions appraised and corrected. No energetic masterful lead could be given them, because ministers were not in office long enough to get a grip on the departments, still less to discover and eradicate those who were disloyal to the democratic republic. No one was in office long enough to care to conceive the orders that ought to be given to the civil and military arms of the state, to raise its welfare, and to defend it against the secular and brutal enemy across the Rhine.<sup>26</sup>

#### THE EXECUTIVE IN THE FOURTH REPUBLIC<sup>27</sup>

The advent of the Fourth Republic seems to have made no radical—perhaps no considerable—difference in the situation, es-

pecially concerning the executive. It is true that all the resistance parties desired firm, swift government with the clear objective of social and political renewal. It is also true that the Pétainist reaction had placed the heaviest emphasis on deficient leadership as the decisive cause of the national disaster, and had substituted for the reign of the chambers the supremacy of a reactionary, irresponsible chief of state. But the French are a democratic people: and so France once again insists that the government shall be conducted by the properly elected representatives of the people. In other words, France is again in the régime of political parties. General de Gaulle, President of the provisional government in Paris from November 21, 1945, to the date of his disgusted resignation on January 20, 1946, was (and is) an enemy of this system, and in several uncompromising speeches before and after his resignation, proclaimed the need for government *above* the rule of parties. Thus (Bayeux, June 16, 1946):

It seems necessary to us that the Head of the State should be elected so as really to represent France and the French Union, that it should be his function to ensure the proper functioning of institutions above the parties and to make the permanent interests of the nation prevail in the midst of political contingencies. It seems to us necessary that Parliament should be one, that is to say, that it shall make laws and control the government, but should not itself govern either directly or through intermediaries. This is an essential point, and implies that the executive power must not proceed from the legislative power, even indirectly. . . . At a time when it is clear to all how the State is undermined by the impotence and division of the parties, is it good to ordain that these parties dispose at their will and without counter-weight of all the powers of the Republic? When everybody observes the deplorable results of Ministers being dependent on their parties, is it good to arrange for this system to become definitive?

De Gaulle was repudiated, and resigned. Did the people accept or reject his constitutional notions? They then seemed to be relieved. The *Service de Sondages et Statistiques* conducted a poll on this question on October 15, 1945. In favor of a

strong presidential régime were 46 per cent; 39 per cent were against; and 15 per cent expressed no opinion. But of the extreme Left only 21 per cent were in favor; of the Left, per cent; of the Center, 61 per cent; of the Right, 81 per cent. Yet the numbers in the Left parties were so much greater than those on the Right and Right-Center. In September, 1946, 11 per cent polled favorably for de Gaulle's becoming prime minister; 30 per cent for his becoming President of the Republic; 39 per cent that he should have no political function at all; 20 per cent "did not know." The Communists voted 80 per cent against his being in politics; the Socialists, 54 per cent; the Left groups, 41 per cent; the M.R.P., 11 per cent; and the Right, 5 per cent.

It was in this period of torment and stress that the draft and the final constitutions were drawn up. The course of the discussion must be, in the interests of clarity, quotation of the articles of the constitution of the Fourth Republic which concern the President of the Republic and the president of the Council of Ministers (or cabinet) and the cabinet, with a commentary on their significance, particularly in the light of the debates in the two separate commissions on the constitution of the national constituent assembly and the debates in the assembly itself.<sup>28</sup> It is convenient to begin with the Presidency of the Republic, though any severance of this does violence to the integration of the plan of the executive.

*President of the Republic.* The President of the Republic is dealt with chiefly in title V of the constitution. Article 29 prescribes:

The President of the Republic shall be elected by the Parliament. He shall be elected for seven years. He shall be eligible for re-election once only.

The article means that the President is elected in a joint session of the two chambers. The M.R.P. and Right parties were insistent on election by both chambers.

The Communist party contended to the last for election by the National Assembly only, their purpose being to have a simple and clear government by the unobscured will of the popular assembly. Some groups even suggested the addition of other bodies, regional, municipal, and colonial, to the chambers as an electoral college. Their purpose was similar to the purpose of the M.R.P.—to secure a Presidency of the Republic who would stand above parties, be strong in his own right, and be "the incarnation of the permanence of the state and the arbiter among parties."<sup>29</sup> This idea, which, with the M.R.P., led to the attempt to build up a strong President with ample independent powers, commended the provision that the President's term should be longer than that of the chambers. Though one suggestion was that it should be six years, it was finally left at the term in the former constitution. There were stated three alternative ways of choosing the President: by popular election, or by election by the Assembly, or by a special college. No one spoke in favor of the first—the dictatorial danger was too menacing, and the French were worried by the nefarious results of the duality of the executive, as between president and chancellor, in Weimar Germany.<sup>30</sup> The third alternative was too fantastic. The constitution makers reverted to the practice of the Third Republic.

However, two differences may be noticed. The Third Republic required an absolute majority of votes for election. The new constitution says nothing about this. But it is understood that the old stipulation applies. However, the M.R.P. had attempted to raise the voting figure, and the rejected draft constitution actually required a two-thirds majority—but this was when only the National Assembly, not a bicameral session, was the electoral body. Furthermore, on the insistence of the Left, re-eligibility was allowed "once only." One other point is worth mention. The draft constitution re-

<sup>28</sup> *Séances de la Commission de la Constitution*: April 25, 1946, and October 2, 1946, referred to respectively as I and II.

<sup>29</sup> Commission, *Séances*, p. 119.

<sup>30</sup> Cf. Chap. 25 below.

quired that voting for the President should be by open not secret ballot. The Third Republic had no stipulation regarding this, but it practiced secret ballot. The Communist and the Socialist parties were content to leave any such prescription out of the constitution altogether and leave it to the assemblies to decide on their own procedure. But the M.R.P. and the Radical-Socialists were eager for the express provision of secrecy. The former, especially, re-espoused the secret ballot, on the ground that since they wanted a strong and independent Presidency, who would need qualities of tact and diplomacy and even of "international clairvoyance" (surely a veiled reference to de Gaulle), he must not be a political appointee and partisanship must not be stressed, which it would inevitably be if his electors voted openly. The general body of the constitutional committee preferred open voting in order to emphasize the direct responsibility of members of the chamber. By a very narrow margin, the provision whether for open or secret ballot was left out of the constitution.

There is little point in reciting the various powers attributed to the President of the Republic, for the simple reason that article 38 requires that:

Every act of the President of the Republic must be countersigned by the President of the Council of Ministers and by a Minister.

This double countersignature signifies that the political responsibility for the acts are taken by those who so countersign. Since no countersignature is likely to be appended unless the countersigner is satisfied that the act is politically sound and defensible before the chambers, the real political will is not the President's but the prime minister's and the cabinet's. In other words, the President of the Republic is put into much the same status as his predecessors of the Third Republic and much in the political position of the Crown in England.

The Left parties were determined to avoid a split or dual executive which might cause a conflict of authority and obscure the true source of responsibility.

This was by no means to the taste of the M.R.P. and the groups of the Right, who fought hard for an independent, forceful President and against a President who should be only "King-log." They fought, but lost, a battle against the Left parties, in favor of retaining the right of pardon in the Presidency—a sign of majesty. The Left parties preferred to put the right of pardon into the hands of a committee of the National Assembly—especially the Communists, who saw the potential political implications of some acts of pardon—and it was finally assigned to the Superior Council of the Judiciary and to the President. Against the strong opposition of the Communist and Socialist parties, the M.R.P., threatening disruption of the tripartite coalition of that time, won for the President of the Republic a potential "suspensive veto" on laws coming from the chambers which was almost identical with that of the Third Republic. For article 36, which requires the President to promulgate the laws within ten days of their receipt (or five in an emergency), permits him to "ask that it be reconsidered by both chambers; this reconsideration may not be refused." In vain did the other parties observe that if this required, like all other acts, the countersignature of the prime minister, it was stupid to establish the power; in vain, also, their reminder that the power had never been used throughout the Third Republic!

What is noteworthy is that the former powers of appointment to high offices and ambassadorships and so on (article 30) are now exercisable "in the Council of Ministers," and that the President has no longer the obligation of the execution of the laws, which obligation has been placed squarely on the shoulders of the prime minister. It is also noteworthy that he no longer, as before, has the "disposition" of the armed forces, but, here, instead, simply presides over and orders the minutes kept of the superior council and the Committee of National Defense; he bears the title of commander-in-chief of the armed forces, but certainly without the implications which the title has for

the power of the United States President. He was refused the power to require the president of the Assembly to read messages addressed to it (much desired by the M.R.P.) but was permitted only to address messages to it. No longer has he the right to negotiate and ratify treaties: but only the right to be kept informed of the progress of international negotiation, and then to sign and ratify all treaties.

On the other hand, the M.R.P. and the Right parties were able to put into the constitution an article (32) not to be found in that of the Third Republic, namely:

The President of the Republic shall preside over the Council of Ministers. He shall order the minutes of their meetings to be recorded and shall preserve them.

On this subject, protracted and heated debates occurred.<sup>31</sup> We have already observed that it became the practice of the Third Republic to hold two kinds of ministerial meetings, the *conseil des ministres* and a *conseil de cabinet*. At the former the President of the Republic presided, and here were transacted the most high acts of statesmanship, which certainly concerned and affected the political plans and prospects of the cabinet, but which rose above mere day-by-day political considerations. Such meetings gave the President of the Republic the opportunity to throw in the influence which came from long tenure of office compared with the normal cabinet, and such brains and character besides as the President possessed. But the cabinet meetings considered and took decisions on these questions also, and in addition were concerned with the problems of leadership of the chambers, and the balance among the political parties. The M.R.P. were adamant on writing the President's conventional status into the constitution. The party argued that the President of the Republic must preside over the cabinet if he was to keep in touch with the national affairs, and if he was to be, as they wished him to be, "charged with the permanent interests of the

French community."<sup>32</sup> If he were of no political weight, they argued, then let him be elected in an entirely different way. The Communists were particularly hostile to this provision: they wanted the President excluded from the cabinet altogether, not even present. But the M.R.P. argued that if he were so excluded, it would be impossible for him to be the guardian of the constitution and of the bill of rights. And, indeed, as we have pointed out,<sup>33</sup> the President of the Republic is president of the constitutional committee (article 91) which determines whether the laws passed by the National Assembly involve amendment of the constitution, and this includes the Preamble of Rights. Though this argument did not satisfy the constitutional committee (it was rejected by 24 to 18 votes), nevertheless the M.R.P. succeeded in making it a successful part of its case in the campaign of compromises.

As for the establishment of minutes of these meetings—that is, of the Council of Ministers, not the Cabinet Council—we have already drawn attention to the fact that such minutes were never hitherto kept. On this subject, an honest and patriotic conservative leader, M. Louis Marin, said: <sup>34</sup>

To the great scandal and shame of our country, we are the only nation which has never had minutes of this kind. It was even forbidden, out of a concern for respecting the cooperation of ministers—that is to say, to stifle their responsibility—to take notes during cabinet meetings, on pain of being admonished. This method was still in application in 1939 and 1940.

Who will ever understand—when all assemblies of any kind (I am not speaking of political bodies alone) are provided with councils of administrators and a council of directors and arrange for the taking of such accounts of the meetings as are necessary to fix responsibilities and to stimulate the directors and are necessary also from a practical point of view—how it could happen that in spite of so many projects of law and so many protestations, that

<sup>32</sup> *Séances* II, p. 121.

<sup>33</sup> See p. 154 above.

<sup>34</sup> *Journal Officiel*, September 5, 1946, *Débats*, p. 3523.

<sup>31</sup> *Séances*, I, p. 121 ff.

there were never instituted minutes of the councils of ministers, that is to say, of a meeting of men bearing the heaviest responsibilities and having in their hands the destiny of the nation?

Thus, the Fourth Republic has instituted a President of the Republic hardly differing in total political character from that of the Third Republic.

We turn now to the Council of Ministers or cabinet, dealt with principally in title VI of the constitution.

*Prime Minister and Cabinet.* The makers of this part of the constitution faced three problems. (1) They had to secure a prime minister with a status and authority above that of the unstable contract between the coalition parties that form the cabinet. (2) They needed to make of the cabinet itself more of a team than it had ever been under the Third Republic. (3) They sought to secure the dependence of the cabinet on the National Assembly, collectively and individually, and yet to avoid the ministerial instability which had cursed the previous régime.

Article 45 set out with due form the procedure for the appointment of prime minister and cabinet. Whether at the beginning of a parliament or after a crisis, the president of the council is "designated" by the President of the Republic. It was formally decided not to call the "prime minister" by that name or merely by the name of "president of the council," but to use the name of "president of the council of ministers."<sup>35</sup> (Yet henceforward, "president of the council" is here used alternately with "prime minister" or "premier.") After the designation of the prime minister, he submits his program and the policy of the cabinet he intends yet to constitute. If the Assembly signifies its acceptance, he then proceeds to collect his ministers and submits himself and them to the Assembly. When all together have received a vote of confidence by a roll-call vote and an absolute majority of the deputies, the President of the Republic signifies their formal appoint-

ment. The constitution actually puts this in a negative form, saying that prime minister and cabinet may not be formally appointed until this vote of confidence is obtained.

This arrangement<sup>36</sup> came to be known during the debates as "the double investiture," and the word "investiture" was even desired by the M.R.P. as a symbol of the appointing authority of—the President of the Republic!

The "double investiture" resulted from a compromise between those—especially the Radical-Socialists led by M. Herriot, the veteran cabinet-builder—who wanted a return to the procedure of the Third Republic, and those who wanted something else. The latter was an amalgam of the M.R.P. and the Left, who wanted a clearly discernible well-endowed leader of a team. They wanted the first discussion and vote by the Assembly when the prime minister-designate individually came before it, to be on his policy. That is to say, the leader and the policy were to be prior to the formation of the cabinet; unity would precede coalition; the Assembly would have created unity first. This idea went along with the M.R.P.'s hope (which proved vain) that the President of the Republic would have a strong hand in the choice of prime minister. The two together would have made a strong executive. It must be remembered that at this time the M.R.P. was largely a party of de Gaulle and was attempting to make a constitution to his liking, but it also manifested and still does manifest a sense of the unity of the nation and therefore advocates the strength of its central institutions as transcending the diversity of social groups within the nation.

It would have been possible to elect the prime minister and cabinet in the National Assembly. The Right-wing groups were horrified that this would make the prime minister the "assembly's messenger-boy." The Communist party showed a

<sup>36</sup> It operates unless "*force majeure* prevents the national assembly from meeting," a proviso designed originally to meet the case of an enemy's occupation of the country, but later extended to any forceful obstruction.

<sup>35</sup> *Séances*, I, p. 98.

strong inclination for this. The Socialist party harked back rather to the procedure of the Third Republic, though it did not side with the M.R.P. by any means. Indeed, in pursuit of the Communists' policy of weakening the executive (which the Communists knew they could not capture for themselves, but which, if ever they obtained a majority in the Assembly, they could always elect or dominate), the first and rejected draft of the constitution actually prescribed in article 73 that, "The national assembly elects the president of the council of ministers at the beginning of each legislative term by open ballot and an absolute majority of the deputies." And so also for the filling of vacancies by death, resignation, or otherwise. This method would have weakened the President of the Republic by permitting him only the presentation of candidates to the Assembly. It might also, as was pointed out, have caused protracted delays in the election of the executive—an eventuality which was emphasized by those with a knowledge of the working of the Prussian government in the Weimar period.

The opposition of M. Herriot and his friends to the double investiture was based on a common-sense judgment of what was most likely to happen in the future. They argued that it was more practical to vote on the whole cabinet than on the prime minister alone, since he would never be able to keep the promises he made to the Assembly without the co-operation of the ministers he had yet to seek and appoint, and they could hardly be expected to accept office entirely on his unqualified personal terms. He would later be put in the position of being judged on what he had promised: but less notice might be taken of his predicament in considering what he was able to do with his colleagues. The two steps seemed also to open the way to delays. The Communist party spurned any return to a situation in which the president of the republic would actually appoint prime ministers while knowing that their cabinets would fail or that they would not even be able to gather a cabinet to-

gether, in order by his astuteness to bring in the man he himself wanted when the others had been proved failures. The Communists quibbled long over the right word to use, whether "appoints" or "designates," in order to reduce the president of the republic's role to its weakest terms, and so strengthen the dominion of the assembly, or, in their own language, the "people's will." The Socialist party—remembering, without doubt, the designation of Pétain and Laval to the highest positions in the state at the capitulation, indeed Pétain's signature of capitulation before he appeared in the Chamber—insisted above all that the prime minister-designate obtained no political authority from the president of the republic, that he remained designate only until the national assembly had spoken its will.

The suggestion of the commission of the constitution carried the day: to sever the general policy of the prime minister from that of the cabinet, and to set the prime minister above the "contract between parties," in order to give him the extra authority which comes of his own individual and prior acceptance by the assembly. The commission made every effort to build up the distinct authority and responsibility of the prime minister, or, as the Socialists put it, "to organize the function of prime minister." Manifestly, the strength and mentality of the parties must decide whether this will be of any practical value. For, as the commission itself recognized, no man would accept designation as prime minister without having previously taken soundings on whether he would thereafter be able to find a viable cabinet. And, of course, what he later was able to achieve would depend on bargains already struck. Events since the beginning of the operation of the new constitution have shown a reversion to Third Republic type. Yet it was worth trying. The student will observe the attempt to arrive at the practical predominance enjoyed by the prime minister in the British cabinet system—*primus inter pares* (much quoted, and the Latin tags descriptive of his standing disparaged)—and the predominance of the *Reichs-*

*kanzler* in the Weimar German constitution. The unity, the strength, the stability, and the leadership of the executive as social, economic, and moral pivot was craved by all parties, except the Communist, which preferred the centrality of the legislature—the supreme soviet, and spurned anything in the nature of a separation of powers.

It is not of subsidiary importance that the authorization of the prime minister's and cabinet's appointment is founded on an absolute majority of all the deputies, on a roll-call vote. This is far removed from the excited pluralities, with furtive abstentions which left everybody guessing, of the Third Republic. The article has placed more open responsibility on the deputies and the parties: it may work valuably.

The ministers so chosen, after formal appointment by a decree of the President of the Republic, are (according to article 48) responsible "collectively to the National Assembly for the general policy of the cabinet and individually for their personal actions." They are not responsible to the Council of the Republic.

The constitution makers were anxious that incompetent ministers should be relieved of office, but it was difficult to put this in a form which did not involve the downfall of a cabinet. The difficulty was the greater as all parties were anxious to institute arrangements to strengthen the position of the cabinet as a whole against the will of the excited and tempestuous Assembly. Some suggestion was made that it might be possible to draft the constitution in such a way as to leave it open to the Assembly to censure a minister without destroying the cabinet. The difficulties are plain: the minister is presumably carrying out the policy of the prime minister. He may carry out a whole party with him in his troubles. And what would occur if a prime minister insisted on retaining a minister who had been censured? The common sense of the problem was to leave it to the prime minister to handle his ministers as the political situation required in his own discretion, based on judgment of the Assembly's

wishes and the balance of power among the parties.

We now turn to the problem of bringing responsibility home to the cabinet as a whole. The problem was to assure the cabinet of a reasonable tenure of office, and yet to assure responsiveness to the will of the Assembly. The solution revolved around votes of confidence and censure in the Assembly, and, on the other hand, the power of dissolution vested, under conditions, in the cabinet.

Article 49 declares:

A question of confidence may not be put except after discussion by the council of ministers; it can be put only by the president of the council.

The vote on a question of confidence may not be taken until one full day after it has been put before the assembly. It shall be taken by roll call.

The cabinet may not be refused a vote of confidence except by an absolute majority of the deputies in the assembly.

Refusal to give such a vote shall automatically result in the collective resignation of the cabinet.

It will be noticed that the prime minister is given some predominance, in that no other minister can raise the question of confidence before cabinet or Assembly, which, according to the debates in the constitutional committees, they might well do in a state of excitement. The purpose was to introduce more deliberateness in critical situations, and to make the cabinet a team under the prime minister.<sup>37</sup> The one day's delay before the debate is, as it was recalled in the constitutional committee, to avoid the upset of a cabinet in "the fever of an all-night sitting."

The deputies are put into reins by being confronted with responsibility. For they cannot wreak their will on a cabinet so easily as in the Third Republic, where to overturn a cabinet a plurality of votes

<sup>37</sup> Cf. André Philip, *Débats*, September 6, 1946, p. 3556: "The government ought only to put the question of confidence rarely; after cabinet deliberation, when everyone has maturely reflected and the prime minister has assumed the responsibility."

in the Assembly was enough, and when, therefore, as happened not infrequently, deputies undermined a government by abstention from voting. There may still be abstentions, but the government is secure unless more than fifty per cent of the deputies declare themselves openly and positively against the government.<sup>38</sup>

Much debate occurred over the well-used practice of the governments of the Third Republic which frequently put the question of confidence in their efforts to rally the members of the parties forming the government's coalition. It was asked whether the newly instituted procedure could be effective. For it was pointed out that the whisper could be sent circulating round the corridors that the cabinet was about to resign if obstructed. What the M.R.P. wanted was that the government should be stable: but the Communist party, and in a rather lesser measure the Socialist, was hostile to a cabinet which would be able to threaten the Assembly with a crisis, especially as the cabinet was to receive a power of dissolution.

We now turn to the Assembly's initiative in the overturn of a government. Article 50 says:

<sup>38</sup> An illustration of the operation of the constitution may be offered. On September 5, 1947, the Ramadier cabinet received a vote of confidence of 292 for and 254 against, with 54 abstentions. It was reported that the Prime Minister offered his resignation to President Vincent Auriol, and that the latter refused it, contending that it would be contrary to the constitution unless the Assembly had shown by a clear vote that it wished the government to resign. Then, on November 9, 1947, after being prime minister since January 21, 1947, M. Ramadier resigned, as his majority was not large enough, in his opinion, to support the considerable economic reform measures needed, and to face the steady succession of strikes. M. Blum appeared before the Assembly the next day, but he did not get the absolute majority of votes—he obtained 300 votes whereas he needed 309: 277 votes were cast against him. M. Robert Schuman appeared two days later, and obtained a vote of confidence of 412 votes against 184; the Assembly rallied to him, with the exception of the Communists.

See, for a survey of recent practice, C. A. Colliar, "La Pratique de la Question de Confiance sous la IV<sup>e</sup> République," *Revue du Droit Public*, April-June, 1948, p. 220 ff.

Passage of a motion of censure by the national assembly shall automatically result in the collective resignation of the cabinet.

The vote on such a motion cannot be taken until one full day after it has been made. It must be taken by roll call.

A motion of censure may be adopted only by an absolute majority of the deputies in the assembly.

This is article 49—on the cabinet's right to seek a vote of confidence, and so browbeat the Assembly—in reverse. It also institutes more responsibility in the Assembly's procedure than formerly existed.

The full import of the procedure regarding votes of confidence and of censure emerges from the constitutional provision of the power of dissolution—for this gives a sanction to the government's threats to resign. The constitution says:

If in the course of an eighteen-month period two ministerial crises occur under the conditions set forth in Article 49 and 50, the council of ministers, with the concurrence of the president of the Assembly, may decide to dissolve the national assembly. Dissolution shall be proclaimed by a decree of the president of the republic in accordance with such decision.

The provisions of the preceding paragraph may not be applied before the expiration of the first eighteen months of the legislature.

The cabinet has thus a recourse against the caprice of the Assembly: more, the right of dissolution was supported by Socialists and Radical-Socialists and the M.R.P. and parties of the Right—three quarters of the Assembly—because it was recognized that dissonance might well arise between the will of the Assembly and that of the government and that of the nation. The nation would be arbiter. This was not pleasing to the Communists, who wanted nothing of dissolution, contending that its threat would reduce the deputies to servility. They were afraid of executive strength. They even preferred silence in the constitution on the procedure of votes of confidence. Whereas the Socialists recommended dissolutions as a remedy for the insensitivity produced by proportional representation, the Communists expressed the traditional fear of plebiscites.

The question then was how to implement and yet limit the cabinet's right of dissolution. The M.R.P. was prepared to institute no limitation at all: to leave it to the cabinet to challenge the Assembly whenever it thought proper, and if necessary to take the quarrel to the country. This was strongly opposed by M. Pierre Cot (at one time *rapporteur* of the committee on the constitution, and a Left-winger) with the sensible contention that if this happened, France would supplant a system of ministerial crises with crises of government, that successive dissolutions would overthrow, perhaps, the constitution itself. He and others pointed out the inconclusiveness of the frequent dissolutions under the Weimar constitution, and the exacerbation and public instability they caused. If in Britain the right of dissolution was not limited by any constitutional provision, the stability of British politics must be borne in mind compared with the volatile French temperament.<sup>30</sup> Then the M.R.P. was persuaded at least to allow a closed season on dissolutions—say, the first six months after election, during which the Assembly might find its center of gravity, its equilibrium. The Socialists proposed this closed season. The Communists proposed a limitation of dissolution by allowing it only after three crises (rejections of votes of confidence or passage of votes of censure) in two years. The M.R.P. countered with "two crises in two years." From the chairman of the constitutional committee the idea of an eighteen-month season emanated. Pierre Cot pleaded for a longish tenure of parliaments: there was already a moral crisis, there would be an economic and a monetary crisis—France must beware of adding a political one: "If short governments are bad, short parliaments are worse!"

Article 51 represented another compro-

mise. The Communists did not like it: the M.R.P. was adamant for the right of dissolution. The Socialists were worried, as were the Radical-Socialists, about the freedom of the Assembly to conduct its deliberations without being intimidated by the government's threat of resignation. The Communists persistently pointed to the fact that a cabinet can, at times propitious to it, maneuver a first and a second crisis—they seemed acutely to fear being sent to the country for an election campaign. The Socialists saw value in dissolution and an appeal to the country, since dissolution would come at irregular intervals and would submit a crucial question of policy to the nation. The Radical-Socialists had even proposed that the second chamber be compulsorily consulted as a condition of dissolution!

Thus, the process of menacing the Assembly to obtain a crisis is regulated; the process of throwing a government out is regulated. Therefore the rude freedom of a government to dissolve is restrained. Nothing can stop a government from resigning if it wants to do so; but a resignation, on considered policy or out of personal ambitions or caprice, does not count as one of the crimes which provide a qualification for dissolution. On the other hand, the Assembly has something to risk whenever it provokes the government to a point where it asks for a vote of confidence. For if the vote is given, it strengthens the government and humiliates the opposition groups; while if it is denied, a dissolution may occur, and the opposition may be punished by the electorate. The power of dissolution certainly compels the Assembly to look outward to the people, and be sure that their opposition is not factitious and popularly unjustifiable.

Thus the Assembly and the government have a free hand in the first eighteen months of a legislature. After the lapse of this time, when two ministerial crises have been suffered in any eighteen-month period, a dissolution may occur. The Assembly can be irresponsible, if it wants to be, for a year and a half; after that, if it sins, its sins may be its downfall. The

<sup>30</sup> *Séances*, II, p. 71: "English procedure, which consists in dissolving the Commons in case of ministerial crisis, cannot be applied in France, where temperaments and mores are different, and where the same traditions of political stability or party organization do not exist."

government, on the other hand, is at the Assembly's mercy for a year and a half: after that, if it is clever, it might enjoy as much as a year and a half of power. For if it suffered one ministerial crisis, its enemies must ask themselves who is likely to be in power after them to enjoy the power of dissolution which will come after the next, the second, crisis—and this must surely give them pause about the first. Some argued that as the government that dissolves ceases to hold office (as shown below), dissolution would be used cautiously, if at all.

Few governments fell as a result of the use of the "vote of confidence" articles; none has been in a position to threaten dissolution, possibly because no group, except the de Gaullistes, have expected to gain by dissolution. But, if we omit de Gaulle's two premierships covering September 11, 1944, to January 20, 1946, there have been seven premiers since that date, including the latest, the Radical-Socialist Henri Queville, cabinet. All resigned in the old-fashioned way.

This leaves open the question: Who governs during the elections after a dissolution? Some made the egregious suggestion that the presidents of the parliamentary commissions should do so. Most denied the right of the dissolving government to be the interim government, for there is tremendous fear in France that those who control the government (and especially the Ministry of the Interior) control the elections—especially, they argued, in a time when radio propaganda has become of such influence. The Socialist spokesman on this subject declared:<sup>40</sup>

In my opinion, the exercise of power between the dissolution and the elections must simultaneously offer the guarantees of impartiality and of being automatic.

From the first point of view, it seems to me a delicate matter to keep in office a government which dissolved, because by this very fact, it has taken sides against the assembly. It ought to be replaced by a neutral government, not liable in any way to suspicion of partiality.

From the second point of view, it seems im-

possible to proceed to the designation of a new government, because it might happen that the assembly would not facilitate this, which would obstruct the mechanism of dissolution.

It is perforce necessary to resort to an interim government.

In the British system, the dissolving government remains in power until the results of the elections are known; or it may happen that a government which has resigned gives way to one which takes over from it, and this in turn conducts the government during the election period. But this implies that all parties trust the government not to manipulate the elections in its favor.

The M.R.P. and the parties of the Right opposed interim government by the Assembly itself. But the M.R.P. accepted the idea of all parties in the Assembly having a right to participate in the interim (or, using the Anglo-Saxon phrase, the "caretaker") government. But, as a price for this concession, it wanted the President of the Republic to be at its head! This was firmly rejected by all other parties. Then the question was: Who should head the caretaker government? It was agreed that it could not be the dissolving prime minister. This left only one other "national" possibility: the president of the National Assembly. This solution was accepted by the Socialist and the Communist parties and the Radical-Socialists, but resisted by the M.R.P. and the Right groups. The former gained a victory. The consequence was article 52 of the constitution, which runs:

In case of dissolution, the cabinet, with the exception of the prime minister and the minister of the interior, shall remain in office to transact current business.

The president of the republic shall appoint the president of the national assembly to be the president of the council of ministers. The president of the council of ministers shall appoint the new minister of the interior with the approval of the secretariat of the national assembly. He shall appoint as ministers of state, members of party groups not represented in the government.

General elections shall take place not less than twenty and not more than thirty days after the dissolution.

<sup>40</sup> *Séances*, II, p. 77.

The national assembly shall convene by right on the third Thursday after its election.

The discerning reader will notice the importance, therefore, of the composition of the secretariat of the Assembly.<sup>41</sup> He will also notice that article 52 on the exercise of the right of dissolution requires the government to obtain the concurrence of the president of the Assembly! This is to give extraordinary power to the presiding officer of the legislature and must lead to all sorts of politically tricky problems. It certainly stimulates the fight for the presidency of the legislature: it is bound to check the use of dissolution.

In 1954, however, the constitution was amended: it became no longer necessary for the Premier to resign and to give way to the President of the Assembly: the fear that the Government may, in circumstances of this kind, fall fortuitously in the hands of the communists was the main reason for the change. Later, in 1955, two governments, those of MM. Mendès-France and Faure, fell within eighteen months according to the prescribed procedure of the vote of confidence. M. Faure was thus empowered to use the weapon of dissolution, and although it was thought that the precedent of 1877 would prevent him from using it, he boldly decided to dissolve the Assembly in December 1955.

It only remains to add several other stipulations of the constitution to complete the picture of the executive under the Fourth Republic.

As we have already mentioned, the prime minister is vested with the power to ensure the execution of the laws; with the power of appointment to all civil and military offices (with certain exceptions); with the direction of the armed forces and the coordination of measures necessary for national defense. These acts require the countersignature of the appropriate ministers. Ministers have access to both chambers and their committees, and have the right to be heard whenever they request it. The prime minister may delegate his powers to a minister. In the event of the vacation of his office by death or otherwise, the cabinet appoints one of its membership to act as prime minister temporarily.

On the whole, the constitutional assembly acted wisely in all these provisions. It

did the best that thought could propound, and that the equilibrium of parties could allow, to repair the mischiefs of the executive under the Third Republic.

*Procedure and Secretariat of the Cabinet under the Fourth Republic.* The procedure and organization of the cabinet are founded on rules adopted by the Council of Ministers itself in April, 1947,<sup>42</sup> but this is based on the re-adoption of the secretariat arrangements instituted in 1936 and operating to 1940. The prime minister has his own Secretary of State; the Council of Ministers has its secretariat much as before.

The "secretariat-general to the government," the body of permanent officials, prepares the agenda of meetings, whether of Council of Ministers or Council of the Cabinet, conferring with the President of the Republic and the prime minister. The receipt of communications from the public and from the various ministers is regulated as to the interval preceding submission to the meetings. The convention of secrecy of the British cabinet appears in the French rules in writing:

Secrecy of the deliberations constitutes a state obligation which engages the honor of all present at meetings of the council of ministers.

The secretariat keeps minutes of the meetings which are submitted for approval to the prime minister and then signed by the President of the Republic and preserved in his archives. In order to maintain coherence among the various departments, various laws and regulations provide for interdepartmental committees, conferences, and commissions, rather like the system of cabinet committees in Britain but in France more formalized in legal and regulatory texts. But these need integration with the work of the cabinet. When any of these is unable to secure agreement on the matters within its competence—whether a report for the cabinet, or the draft of a decree to be made under its authority—the prime minister presides over a meeting of the ministers and, where necessary, of their departmen-

<sup>41</sup> See p. 481 above.

<sup>42</sup> *Règlement intérieur des travaux du gouvernement*, avril 22, 1947, notes documentaires et études, No. 605, Série française CXXXI; following *Décrets*, July 25, 1945, and September 1 and 29, 1946.

tal chiefs. The secretariat of the cabinet organizes and serves these special conferences also. The secretariat receives from the various ministers copies of all the various rules and regulations, circulars, and instructions of a general order which they establish for the application of the government's decisions.

The secretariat is in charge of the procedure for the preparation of laws. It receives all the documents and information and correspondence concerning a project proposed by one or more ministers and elaborated by conferences or other communications between them. This goes to the prime minister and to the *Conseil d'État* for its advice, and then is circulated together with the *Conseil d'État*'s report to all cabinet ministers and to the President of the Republic. There follows a further stage of consultations among all concerned, assisted by the secretariat.

At this point the integration with the Economic Council or the Assembly of the French Union occurs. It is now decided at what point of time and in what form the advice of these bodies shall be sought. When this arrives, in a period fixed by the cabinet, the secretariat circulates it to those concerned. On discussion of projects by the National Assembly, whether introduced by the government or by the deputies, the secretariat watches the stages and keeps the ministers concerned informed and alert; and when the law is passed and to be promulgated, the secretariat is in charge of the routine for securing the countersignatures of the President of the Republic and the ministers concerned. A rather similar process of vigilance, notice, stages of discussion, and registration, occurs for decrees of various kinds, and the secretariat also takes care of transmission for publication in the *Journal Officiel*.

A weakness still exists in administrative coordination in that there is no counterpart to the British permanent undersecretaries, but rather the several bureau chiefs at the head of parts of the depart-

ment. The British system was rejected by the constituent assembly.<sup>43</sup>

Thus, the prime minister, or in official parlance, the president of the Council of Ministers, conducts the government of the French nation, set in the midst of a fairly well organized series of agencies, auxiliary to him and his cabinet. He is responsible for the main lines of governmental policy. He has his own immediate personal political assistants in his office as prime minister. His ministers share responsibility with him, but not with the measured and assured solidarity of the ministers in the British cabinet. They have the assistance, over and above their departmental officials, of that special characteristic of French administration, consultative councils, often several connected with each department. Drawing them all together, as a unit, is the prime minister, and helping him in this process to attain some view of what is to be done, why it is to be done, and what means are to be depended on once the decisions have been taken, is the secretariat of the government. This links the cabinet and the individual ministers

<sup>43</sup> M. Jacques Bardoux: cf. his *La France de Demain* (Paris, 1936), papers edited for the *Comité Technique pour la Réforme de l'État*. Representing the Republican peasant and social group, and himself a professor of law, he proposed to limit the number of cabinet ministers to ten, in the constitution. He also recommended the institution of departmental permanent undersecretaries, saying: "The minister assures contact with opinion and liaison with parliament. The secretary-general assures contact with traditions and liaison with the departmental sections. The ministers represent evolution; the secretary-general, continuity. The minister talks, the secretary-general writes. The minister passes; the secretary-general remains. One, that is, the minister, commands; the other, that is, the secretary-general, executes." The M.R.P. reporter of the draft constitution did not meet the argument, but explained that he was profoundly convinced that "departments must not be administered by technicians, but on the contrary, by men of profound general culture, not having suffered professional deformation and, yet capable of discerning and solving the problems of our own time." Cf. *Journal Officiel, Débats*, September 5, 1946, pp. 3526-7.

with the four assemblies which constitute the representative bodies in the Fourth Republic's constitution: namely (1) the National Assembly, which is will-determining, (2) the Council of the Republic, which plays a minor part in the formation of the sovereign law-making will, (3) the Economic Council, which is consultative and based on the functional groupings of the nation, and (4) the assembly of the French Union, designed to give a consultative voice to the overseas possessions on matters concerning the whole empire.

Again, the prime minister and the cabinet are linked to the specific economic planning machinery provided to implement the Monnet Plan broadly as follows. The decree of January 3, 1946, created a "council of a plan of modernization and equipment." It prescribed the powers to be exercised by a commissioner-general for the Plan. The council was established as a subordinate of the presidency of the Council of Ministers. The objects of the Plan were to increase production, foster investment in the basic utilities and equipment of the nation, develop the standard of living, make good the devastation caused to the nation's production capacity, and promote full employment. The council of the Plan is composed of the prime minister and ten ministers at the head of the principal departments concerned with the economy and reconstruction, including the Minister of Foreign Affairs, and, in addition, the Commissioner-General for German and Austrian affairs and the Commissioner-General of the Plan. The prime minister and the Minister of National Economy appoint twelve or fourteen other members, chosen for their special competence. Under the prime minister, the Commissioner-General has his own staff. He acts as the permanent delegate of the prime minister in all departments for the purpose of establishing the Plan. He is a member of the economic committee, of the interministerial committees on German and Austrian affairs, of the National Eco-

nomic Council, and of the National Council of Credit. He may pursue whatever inquiries he finds necessary in any departments of the government and may secure their cooperation. All agencies of the public administration are ordered to give him the information he requires for the establishment of a comprehensive budget of the national economic situation, while the departments concerned with the national economy must communicate to him their various plans and proceedings. Thus assisted, he is further helped by many consultative committees of employers and workers, of experts and high departmental officials and professional bodies, which he sets up but the decreeing of which is reserved for the prime minister on the proposal of the commissioner-general. At his disposal the Minister for National Economy puts various of the institutes of research which are located in or under the supervision of that department—for example, the Institute for research into Prices and Fluctuations, the Division of Capital Development, and the National Center of Economic Information.

Thus, truly valiant efforts have been made by the founders of the Fourth Republic to achieve a steady leadership which sees things whole. The machinery and procedures are provided; what is lacking still is the unity and harmony of the electorate, which alone, by providing a stable majority party or a congenial coalition, could secure the movement and oneness of which leadership consists. For the French have lacked and still lack the spirit of Whig politics, as expressed by that Edmund Burke who foresaw the lethal effect on French polity of the Revolution:

They believed that no man could act with effect, who did not act in concert; that no man could act in concert, who did not act with confidence; that no men could act with confidence, who were not bound together by common opinions, common affections, and common interests.\*

[\* See *Addenda*, p. 959.]

## *The German Cabinet System*

IN this chapter it is proposed to describe the executive under the Weimar constitution,<sup>1</sup> and then to sketch briefly the nazi executive. This is followed by some short general observations and a word or two on the executive in the U.S.S.R.

### THE FALL OF THE IRRESPONSIBLE EXECUTIVE

FROM the abortive provisions of the Frankfurt constitution of 1849, down through the struggle in the 1860's between the *Reichstag* and Bismarck, through the discussion of the chancellorship in 1871 and 1878, through the autocratic career of Bismarck, clear down to the allegations of President Wilson in 1918, no "responsible" government existed in Germany. In the center of the German *Reich* under the

Weimar constitution was, however, a responsible ministry. The experience of Germany with cabinet government is certainly of high scientific interest, though it embraces little more than a decade.<sup>2</sup>

*The Nemesis of Irresponsibility.* World War I revealed two weaknesses of the old irresponsible ministerial system of Germany and Prussia. That system assumed broadly that there was no necessity for an agreement between government and people before action was taken. This operated not badly in fair weather, for it takes a fool of astronomic dimensions to do immediate and obvious damage to a great modern state. But much more was demanded from government in war than in peace. In England and France the people knew their leaders—or believed they did; they believed that ministers were men of their choice, and had been accustomed for generations to the view that a responsibility rested upon themselves for that choice. It was natural to expect them to support even the mistakes of their leaders, and to repair any damage by extra effort. The state was in danger, and they were the state: they must defend themselves, and for this, no effort, naturally, ought to be refused. Indeed, World War I was fought by liberals and radicals, just as many men of the Left as of the Right! In Germany this was not so. While the victory and the stories of victory warmed the

<sup>1</sup> On the Weimar Republic and its fall, see, among others: S. W. Halperin, *Germany Tried Democracy* (New York, 1946), which has an excellent bibliography; Hitler, *Mein Kampf* (New York, 1940); R. T. Clark, *Fall of the German Republic* (London, 1935); A. Fried, *Guilt of the German Army* (New York, 1942); Otto Braun, *Von Weimar Zu Hitler* (New York, 1940); A. C. Grzesinski, *Inside Germany* (New York, 1939); Ruth Fischer, *Stalin and German Communism* (Harvard, 1948).

<sup>2</sup> Cf. C. J. Friedrich, "Development of the Executive in Germany," *American Political Science Review*, April, 1933.

hearts of citizens, all was well—they were at one with their government. But after two years of indecisive war, industrial conscription, and food difficulties, a questioning began which could not be stilled. Nor could even the presence of the Kaiser, the hereditary king of Prussia, with the dominant constitutional sovereignty, the All-Highest himself, overcome the sullen apathy of the munitions makers. For they saw that they were not the state—that they and their political parties, however big and well-organized, had no real control whatever over leadership and therefore over the destiny they were asked to accept. Moreover, the real state of the country and the military situation was known only to a very few. It was not necessary for the government to consult the parties; there was no compulsion to do so. It was, however, more necessary than anywhere else in the world to maintain the illusion of absolute, if not of speedy, victory, for the prestige of success, not the sense of shared responsibility, was the title of the ruling class to its office. In other countries the public mind was always stimulated by the news that danger loomed; in Germany it was necessarily drugged. Suddenly, then, out of the blue, after inordinate exertions, and unparalleled privations suffered on the continuous and immaculate assurance of victory—suddenly, Army headquarters itself was heard to be in despair! The system collapsed. It has been said that it fell through a class war, “literally over a piece of bread.”

Large masses of the middle classes and the peasantry seceded from the Conservative party and the National Liberals. The Catholic Center, reminded of its Christianity by Erzberger and of its Christian trade-union following, moved to the Left. The direction of the war, which meant the direction of all Germany, had since the end of 1916 fallen into the hands of Ludendorff and the general staff, and the Kaiser had been effaced. The opposition hardened. Already in March, 1917, the Social Democrats, the Independent Socialists, and the National Liberals demanded a constitutional committee to revise the

constitution. The demands became clamorous. At Easter, constitutional reforms were promised for after the war, the main promise being the institution of direct and equal suffrage in Prussia, the agitation for which had begun before the war and had continued with increasing, and then critical, emphasis. The famous Peace Resolution, won against the government and Ludendorff, was carried in the *Reichstag*. Bethmann-Hollweg fell, Michaelis fell, Hertling fell. The government was in a permanent minority. The Russian Revolution eliminated a foreign foe, but the scaled carriage from Switzerland to Russia which contained Lenin, with whom Ludendorff successfully infected Russia, proved to contain a powerful toxin to which Germany succumbed. The Spartacists formed on the socialist Left. Strikes broke out. Could the country be rallied?

*The Transition to a Parliamentary Executive.* Attempts were made. At the end of 1917, Von Payer, of the Progressive party, was made vice-chancellor, and the deputy prime ministership of Prussia was given to Von Friedberg, a National Liberal member of the *Reichstag*. A law passed in August, 1918, on the composition of the *Reichstag* and proportional representation in large constituencies, added forty-four seats in the hitherto underrepresented industrial constituencies. This would never have been done by the government and conservatives save under the most terrible duress. Woodrow Wilson, the former American professor of political science, pressed Germany toward democracy by his notes refusing peace negotiations with the autocracy. On September 30, 1918, when an armistice was already being sought by the supreme war council, the Kaiser, in a decree directed to Chancellor Hertling, promised a parliamentary system.

I wish that the German people should cooperate more effectively than before in the determination of their destiny. It is therefore my will that men who have the people's confidence shall participate in a large measure in the rights and duties of government. I bid you to bring your work to a close by continuing the work of government and to put into operation

the measures I want, until I have found a successor to you. For this I await your proposals.

Prince Max of Baden, a ruler with a reputation for political liberalism, was appointed chancellor, with a cabinet of secretaries of state chosen from the *Reichstag* and made "Commissioners [not members] before the *Bundesrat*" in order not to forfeit their membership of the *Reichstag*. Prince Max introduced his government to the *Reichstag* on October 5 with a declaration reminiscent of those made by newly formed French cabinets.

On October 22, a bill amending the constitution was introduced by the government "to free the new government from its constitutional limitations which still stand in the way." The amendments were as follows:

(1) Declarations of war required the confirmation of *Bundesrat* and *Reichstag*; treaties of peace and other treaties within the scope of federal legislative competence needed the consent of both houses.

(2) The imperial chancellor required the confidence of the *Reichstag* for the conduct of his office. [It is because this had never yet existed in Germany or Prussia that I have so often said that the German political parties were not sovereign.] The chancellor was to bear responsibility for all acts of political significance undertaken by the emperor in the execution of his powers under the constitution. The imperial chancellor and his substitutes were to be responsible for the conduct of their office to both houses.

(3) The nomination, seconding, promotion, and retirement of naval officers and men had to be countersigned by the chancellor. (These had hitherto been within the uncontrolled competence of the Kaiser.)

(4) The chancellor's countersignature was required for the highest appointments in the state contingents of the army, and for the appointment, seconding, promotion, and retirement of military officers in the state contingent.

(5) For the good government of their contingents, the war ministers of the

states were responsible to the *Bundesrat* and *Reichstag*.

Thus the irresponsible executive had been overthrown. The reforms, too, were suspended by the revolution and by the abdication of the Kaiser and princes. The impetus of change thereby grew stronger and produced the constitution of August 11, 1919, and especially the clauses on the executive. For two months the floods of constitutional desire let loose a storm which seemed to threaten the chances of parliamentary democracy—for the soviet system across the Russian border was strong meat for feverish spirits. The threat was, however, without substance, and in the elections of January, 1919, for the constitutional assembly, majorities were returned for whom the parliamentary way and the cabinet system were the very breath of their political lungs. The smoothness of the transition, and the revulsion from Leninism, proved later to indicate so full an acceptance of the democratic spirit as to let the Nazis in.

#### THE CABINET SYSTEM OF 1919

LET us consider the cabinet system as instituted by the constitution and molded by political behavior. These things will be observed: the incomparably more detailed regulation of the system in the constitution and other documents, the intentions leading to the adoption of the system, and the effects of the party system upon it.

Above all, an error of classic dimensions was made: the executive was divided into two agents—cabinet and President—with confused responsibility, all the more serious in a nation with a multiple-party system. The tradition of and passion for a strong executive proved the German undoing.

*The Constitutional Articles.* The Weimar cabinet system was formally based upon (1) certain articles in the constitution,<sup>3</sup> (2) certain articles in the law of the budget,<sup>4</sup> and (3) the rules of procedure relating to the imperial government.

<sup>3</sup> Articles 52-59.

<sup>4</sup> Article 21 chiefly.

A President, elected by the people, had a number of powers:<sup>5</sup>

all orders and decrees of the President . . . require for their validity the countersignature of the Federal Chancellor or the competent Federal Minister. The countersignature implies the undertaking of responsibility.<sup>6</sup>

This went not far beyond the terms of the old constitution, and the virtue of responsibility lies, as we have seen, in the body to whom responsibility is owed. This article said no more than that the President was not responsible—that some one else was—but said not whom.

Responsibility was broadly defined further on in the constitution.<sup>7</sup>

The Chancellor of the Federation, and the Federal Ministers require for the administration of their office, the confidence of the *Reichstag*. Any one of them must resign, should the confidence of the House be withdrawn by an express resolution. . . . The Chancellor of the Federation determines the main lines of policy, for which he is responsible to the *Reichstag*. Within these main lines each Federal Minister directs independently the department entrusted to him, for which he is personally responsible to the *Reichstag*.

It will be observed that "for the administration of their office" would include the countersignature of Presidential actions; and for such administration, responsibility was to the *Reichstag*.

The rest of the clauses deserve further comment. Unlike the French Third Republic constitution, provision was that responsibility should be to the *Reichstag*, the popular assembly, alone. This arrangement marked the tremendous gulf between the Weimar constitution and the imperial constitution from the standpoint of federalism, for it is a recognition and a guarantee that the body representing popular unity is paramount over the *Reichsrat* which represents states—while in the old constitution, the *Bundesrat* was the source and guardian of federal leadership.

What then prompted this arrangement and the consequent problems? These

clauses originated with the creator of the constitution, Preusz, and were accepted, in their original form, by the States Committee which examined the constitution before its introduction into the constituent assembly.

Let us examine Preusz's view up to this point. He rejected both the nonparliamentary executive of the United States, and the conciliar system of Switzerland, in which the government is a directly elected committee of parliament. Instead he provided for a titular executive (the president) popularly elected, and a responsible cabinet. Of the cabinet he said (and notice in italics some of the weakness):

The President of the *Reich* is not limited in the selection of Ministers and most importantly, of the Chancellor, to members of Parliament; because *it is by no means an essential requisite of the parliamentary system that the leading statesmen shall be members of Parliament*; but it is quite essential that they shall conduct the government in agreement with the parliamentary majority, and that they must resign should the majority deny them its confidence. For the general policy of the government the Chancellor is responsible; and ministers are appointed by the President upon his nomination. These are, however, not, as hitherto, nonindependent and subordinate helpers of the Chancellor, but stand toward Parliament as independent statesmen responsible for their Departmental administration.

Observe, then, the emphasis on the departmental character of the ministers! Preusz continued:

For the formal responsibility of the Chancellor for every individual Department would, as in the past, so in the future, be a fiction weakening the true political principle of responsibility.

That is, let us have done with a mere fiction, and concentrate upon those who do the work, those to whom the chancellor is obliged by the pressure of business to devolve the work, and let us hold them directly responsible.

And the agreement of the parliamentary majority with the general direction of the government's policy does not necessarily include the acceptance of the administration of each

<sup>5</sup> Articles 45-49.

<sup>6</sup> Article 50.

<sup>7</sup> Article 54.

individual Department. Much more will the desirable influence of Parliament over the practical conduct of administration be strengthened, *where Parliament can produce changes in the conduct of individual Departments without a change of the whole Government.*

Preusz thus put his finger on one of the small practical weaknesses of collective responsibility for all and everything in the British system, and attempted to obtain the advantages of ministerial stability with true parliamentary strength in criticizing and eliminating unsatisfactory ministers. He saw the British constitution in books; and perhaps the passage out of Morley's *Walpole* struck him—as a German desiring efficient government—with more force than it really possesses. For we have already shown that collective responsibility makes ministers preternaturally aware of the infirmities of candidates for office, and causes them to restrain the foolish. Even then, a colleague who has really committed an error in an unimportant matter may be dropped, while if there has been an important error the minister may save his colleagues by resigning. While ministers command a sound majority for all except a particular departmental policy, it is the minister, not the cabinet, who will go.

Preusz was not convincing in showing that his differentiation could be made to work. His concluding remarks on these clauses serve to show that he was unsure of his ground, for he said:

Out of this arrangement of the relationship between the Chancellor and Departmental Ministers, practice will cause a more collective co-operation of the government, without the "collegiate" system being formally prescribed for it by the Constitution, a thing which is not to be recommended in the interests of clear political responsibility.

Thus he envisaged collective action, and could therefore have safely prophesied collective general policy, and a collective feeling of responsibility and collective resignations in most cases. Further, had he reflected that, in the future, cabinets would be composed of members of a large

number of different parties, he would not have imagined that any arrangement could possibly produce any clarity of political responsibility. In introducing the project into the assembly, Preusz added little to his explanation: the chancellor was now "President of the Imperial Ministry," and the "collective" system was not prescribed but was left to the molding force of practical needs. This sounds as though already the chancellor's superior status was reduced to nothing more than the position of the British prime ministership, and as though practical experience already showed the inevitability of collective counsel and responsibility.

*In the Constitutional Committee.* We now follow the project into the constitutional committee. There two tendencies prevailed: (1) to strengthen the chancellor, and (2) to set out more clearly the nature of the relationship between ministers and the "Government" as a collective body. (1) The chancellor, in Preusz's draft, was appointable by the President, but the ministers were to be nominated by the chancellor and only then appointed by the President. Then, apparently, the Presidency was strengthened at the expense of the chancellorship, by an amendment that both chancellor and ministers should be directly appointed and dismissed by the President. The reporter of the constitutional committee on this part of the constitution was Clemens von Delbrück, himself a former Secretary of State in the Empire, and son of Bismarck's colleague and vice-chancellor. He showed that several parts of the machinery were lacking. Insufficient, for instance, was said regarding the power of the chancellor and his relation to ministers. Was a "bureaucratic"—that is, a "chancellor" system envisaged, or was it to be a "collective" organization? Von Delbrück so expressed the problem:

To create an institution in which power and unity are combined, that is to say, a responsible institution—one responsible institution let it be noticed—must arise in which all the threads come together, an institution which is in the position to supervise all the items of business in broad features; and we must, on

the other hand, decentralize not only in depth but in extent.

Von Delbrück's suggestions were adapted to this end, and were supported by reference to federal and Prussian history. He suggested (1) that ministers should be appointed only on the nomination of the chancellor; form ought to add authority to what would, at any rate, be the practice; (2) that the chancellor should preside over the government; (3) that the government as a body should create rules of procedure to be ratified by the President. All these things would strengthen the chancellor, and this must be done lest "on one fine day government get entirely out of hand." Then (4) there should be an express provision (till then not suggested) that "the chancellor decides the general lines of policy." This gives the chancellor the power to intervene in the administration of each individual department with some such observation as: "I warn you that the policy of the department is no longer in accord with the lines I have laid down. On the other hand, it must be said that the ministers, within these lines, are independent in the conduct of the branches of business entrusted to them." (5) Now, since Prussian and federal experience had shown quite clearly that certain things affect all departments, arrangements must be made for their collective treatment: all bills, including the Budget, all differences of opinion about the treatment of affairs touching several departments, and other matters already allowed for by the constitution—e.g. the dissolution of the *Reichstag*. (6) Finally, let the resolutions of the government be taken by majority vote, and give the chancellor a casting vote. This would enhance the importance of the chancellorship.

The general opinion of the constitutional committee seems to have been that neither a purely collective nor a purely chancellor system was appropriate, and von Delbrück's conclusion was that a chancellor system was not wanted, while collectivity was necessary to abolish contradictions—hence his suggestion for de-

cision by vote. In short, something—not exactly defined—between the Bismarck system and the cabinet system with collective counsel and responsibility was sought, but it was not positively and comprehensively stated what this should be. There are points beyond which inventive political thought cannot reach, since the number and magnitude of the interrelated and present-future changing imponderables cannot be precisely and fully seized in words. Then, we cannot help quieting our doubts with simple inklings, and prescribing only the very little which seems certain.

*Final Adoption.* Von Delbrück's additions were accepted almost verbatim by the committee and the *Reichstag*, hardly a word being said in discussion or explanation of the cabinet system in the second and third readings of the assembly. What, then, had been created? A government: "The Federal Government consists of the Chancellor of the Federation and the Federal Ministers"; that is to say, apparently, a governing body, a council. Were all subordinated to the council on equal terms? The intention was to give the chancellor a distinct and effective primacy, and this was believed to have been accomplished (1) by naming him as a separate party in the government; (2) by his power to choose his ministers; (3) by his presidential authority over the government: "The Chancellor presides over the Federal Government and directs its business, according to standing orders drawn up by the Federal Government and approved by the President of the Federation;" (4) by his right and power to determine the main lines of policy; and (5) by his power to give a casting vote. Were people thinking of a collectivity when they thought of "government"? Perhaps; indeed, most likely; but we do not really know. Preusz seems to have expected this to come about.

The only express arrangement for subordination to the government as a collectivity was in article 57:

The Federal Ministers must submit to the Federal Government for advice and decision the draft of all Bills, also all matters for which such

a course is prescribed by the Constitution, or by law, as well as differences of opinion upon questions affecting the sphere of action of several Federal Ministers.

*The Rules of Procedure and the Budget Act.* Even the rules of procedure and the special position given the chancellor by the Budget Order did not preserve the legal dogmas from unceremonious repudiation by the political parties. But before we examine this and its causes, let us consider the contributions made to German government by the Rules of Procedure and the Budget Order.

The Rules of Procedure were made in 1924, that is after five years' operation of the new system. Until that time the ministers had cooperated either without formal regulations or on the basis of casual rules. By 1924, then, there was experience of ministerial business and of the dependence of the ministry upon the *Reichstag* to go upon. The Rules of Procedure are also interesting examples of the German passion for committing their social arrangements to systematic statements of law. No other country, save Weimar Prussia, had or has such rules in such deliberately and carefully planned arrangement. Let us briefly consider their contents.

The Rules fell into four sections: the chancellor, the chancellor's deputy, the Ministers, the government.

*The Chancellor.* The chancellor, informed of all important measures, laid down the main lines of policy for the ministers. Contemplated changes or new policies of the ministers had to be brought to the chancellor for his decision.

*The Chancellor's Deputy.* At the chancellor's suggestion, the President of the *Reich* could appoint one of the ministers to deputize for the chancellor, in which case the chancellor determined the scope of the deputization.

*Ministers.* The minister's field was largely determined by the chancellor except where a policy touched more than one department when other ministers were called in, and ministers likely to demur had to be conferred with.

Deputations were, as a rule, receivable only by the appropriate ministry; a com-

mon reception might be given when the subject required it. The chancellor received deputations only exceptionally and as a rule only at the instance of a minister.

Foreign negotiations were to be conducted only through the Foreign Office; its assent and cooperation were required should other ministries desire to negotiate. Interviews touching foreign affairs were not permissible without previous arrangement with the Foreign Office.

*The Government.* The following subjects were to be brought before the government for discussion and decision:

(1) All projects of laws, all matters prescribed by the laws or the constitution, and the differences of opinion on questions which touched the business of several ministers.

(2) Drafts of all orders of general political significance; public announcements and citations from public archives where these should occur simultaneously by the *Reich* government and the states; suggestions for the appointment of high and unclassified officials and assistant secretaries, and for the variation of the established conditions of certain civil service posts. Further, matters of general or foreign importance of broad economic or financial effects had to be brought to the attention of the government. Attempts were of course made to reconcile differences that arose among the ministers.

Rule 24 was designed to secure the full concentration of leadership in the government and to avert disunity in relation to the branches of the legislature. When the Federal Council suggested important changes in a government bill, the government had to be consulted on the next step; similarly, if a minister concerned took exception to a proposed amendment. Important amendments offered by the *Reichstag* had the same effect. Where the case was urgent and a decision had to be taken at once, then agreement with available ministers was required.

All bills resolved upon by the Government are to be represented in the *Reichstag*, the Federal Council, and the Economic Council concordantly, even if individual ministers hold a

## THE GERMAN CABINET SYSTEM

different opinion. All officials, directly or indirectly concerned, are prohibited from acting against the views of the Government.

At cabinet meetings there were regularly present the chancellor, the ministers or their deputies, the secretary to the Chancellor's Department, the chief of the President's Office, the chief of the Government Press Service, and a clerk. The deputies had full rights of discussion and voting. Ministers might, where this seemed desirable, and with the agreement of the chairman, introduce a permanent official, who might be present only for the time and the specific purpose for which he was called in. This arrangement seems to me of extraordinary value in the modern state and, of course, it has from time to time been followed in England, when officials are called in to help ministers in matters where policy and technical knowledge cannot be separated, and do especially important service in cabinet committees. Minutes are taken, and the relevant extracts distributed to the various departments.

*The Minister of Finance.* It is well understood in the British system that the Chancellor of the Exchequer has a position of exceptional importance, and often of extraordinary power. The reason is simple: the Chancellor of the Exchequer must find the money which his colleagues have planned to spend. He must not be driven to impossible demands upon the public, and, therefore, he has been provided with a power of defense. Besides this, however, there is his own positive sense of responsibility for the industry and commerce of the country, and for the private purse of the citizen. A Gladstone or a Harcourt or a Snowden is strong, and in single combat with any minister, is usually sure of victory. Disputes of any magnitude become cabinet questions, and there the battle is between the Chancellor of the Exchequer and the majority against him, for the support of the prime minister. The Chancellor of the Exchequer and the prime minister together are, in all ordinary circumstances, irresistible.

German law followed the essentials of

English practice. In the *Reich* Budget Order of December 30, 1922, the Minister of Finance was provided with a veto over the inclusion of expenditure or a rider in the budget. This veto could only be overcome by a majority of the cabinet and if the *Reich* chancellor was in this majority. In other words, Minister of Finance and chancellor could together settle the budget. This arrangement was forced into law by the financial difficulties of the postwar period. Yet the rule, which also appeared in article 32 of the Rules of Procedure, did not square with the constitutional clause that decisions were taken by a majority vote. Indeed, both von Delbrück and one other member of the constitutional committee emphasized that ministers ought not to become dependents of the Minister of Finance. The order was therefore passed with the majorities required for constitutional amendments. It is obvious that, legally, the position of the chancellor and the Minister of Finance was by this order raised above that of other ministers and above the position given by the constitution, while the other ministers had been made legally subordinate for financial purposes. It is a well-known fact, however, that where men enjoy a legal predominance they will very probably acquire an actual predominance, owing to the compelling effects of legal concepts on the mind of those who come into relation with them. Nor does the effect threaten to stop at this point: for a power in one direction is a power to intimidate and bargain in every other. It may be overcome by the political resources of the other ministers: but it is still a power to overcome, which requires a countervailing force.

### THE ACTUAL OPERATION OF THE WEIMAR SYSTEM

CAN the predominance of the *Reich* chancellor be inviolate? Is the Minister of Finance assured of the power given him by the constitutional amendment? Do majority votes decide matters? All these things may be subjects of formal prescription,

and again, formally, they may follow the course provided by the constitution and the Rules of Procedure, and yet the balance of political forces may govern the actual substance and nature of the formalities. Thus a chancellor's main lines of policy may be written down by him and be formally called his: yet what was established may have been the result of the composition of a party whose cooperation was essential to his ever having been able to accept the chancellorship. A Minister of Finance may threaten to use his veto power over an estimate, but what if he is told that its use will cause him to be outvoted on an ordinary measure which his party considers vital? A majority and a minority in the cabinet are in the process of formation: the minority asks for concessions and, unless they are granted, it is prepared to withdraw from the government. No better governmental arrangement can be made in the existing state of parties in the *Reichstag* and the country. The majority must to that extent give way. In short, the majority vote is based not upon the equality of ministers but upon the political strength of each in the special circumstances. There is no doubt, when we consult the experience of Great Britain and France over a long period, that various ministers assume different significance at different times. Sometimes there is a kind of instinctive subordination to the Foreign Minister, sometimes all defer to the departments concerned with unemployment, and almost always the Treasury is rather overpowering.

The experience of Germany shows that the party system so filled up the formal bottles of the constitution that these burst.

*Formation of Cabinets.* We have shown in the cases of England, France, and the United States that the composition of the executive determines its power. So with Germany; here as in England and France, all went back to the character and number of political parties. Had Germany had a two-party system or something near it, then the constitutional articles might have been made to work in admirable and accurate accord with their intention: but it had not. The President of the Federa-

tion appointed and dismissed the chancellor, and, on the latter's recommendation, the federal ministers. This article appeared to give the President a free hand with the chancellor, and the chancellor a free choice of ministers, including the Minister of Finance. In fact, the President was very narrowly limited in his choice; and the chancellor, before he could accept the chancellorship, needed to get a group of colleagues. But these could normally afford to be extremely exigent before they entered his government. For the German Parliament, like the French Chamber of Deputies, was divided into a number of parties, none of which, after 1919, was able to approach a majority of the assembly. The situation therefore dictated coalition ministries. Thus the President was obliged to find a chancellor who, to discover a coalition, could fulfill two conditions: obtain a *Reichstag* majority, and maintain it for an appreciable time so as to avoid political vicissitudes. This second condition had been borne in upon the Germans by their own long experience of stable if autocratic government, by their desire for regularity and order in all things, and by the warnings which obtained from their intellectuals who ever paraded French ministerial instability as something which Germany must at all costs avoid. On at least one occasion, von Hindenburg, when President, threatened to dissolve the *Reichstag* unless his own nominee speedily found a coalition.

The principle that the largest party was to be called in to lead the government, provide a chancellor, and form a ministry was rejected for the principle that the prime consideration was the speediest formation of a practicable cabinet. After the elections of May, 1924, the German National party press urged that the President would violate the principles of parliamentary government if he did not choose the chancellor from that party, as the largest; yet Chancellor Marx of the Center party was asked to form a ministry, and the Nationals were left in the opposition. Again, when the Stresemann ministry fell, in November, 1923, the German Nationals insisted, in a letter from the

leader of the party to the President, that "as parliamentary usage demanded," one of the opposition parties should be entrusted with the formation of a new government. They themselves were prepared to accept office, dissolve the *Reichstag*, and consult the people anew to see whether, indeed, the country was not turning to the Right for a government. To this the President answered (1) that the constitution left him full discretion in the matter; (2) that the use of this discretion had on his part been directed to securing "a personage whose political position seemed to promise most hope of the speedy composition of a workable Cabinet;" (3) that confidential discussion with *Reichstag* group leaders had convinced him that the opposition parties offered no hope of this, and (4) that even the German Nationals had admitted their readiness to follow a chancellor of the Popular party and the Center. It is to be remarked that, in this letter, Ebert admits his partiality for a coalition of the Left rather than the Center, and says he accepted the Center only because his first attempts had failed. In later and more crucial stages of the Weimar *Reich*, President von Hindenburg bargained with von Brüning and with Hitler, and his personal wishes (and therefore those of his private nationalist and conservative entourage) emerged as public policy, to the final accession of the Nazis.

*Short-lived Cabinets.* From February, 1919 to January, 1933, there were twenty cabinets; that is, each cabinet lived for eight months. There were various reasons for this weakness. Of very great importance was the disturbing and uncontrollable effect of foreign pressure upon Germany. Every time a crisis occurred in German foreign relationships, the balance of political strength and loyalty was rudely disturbed, since passions were so roused that often one could best govern by resignation from the government. Thus I count at least four cabinet downfalls as due to unavoidable foreign events. Another three defeats were due to the *malaise* of a new constitution: the Kapp *putsch*, stringency of measures against Saxony

and Bavaria, a conflict over the national flag. Four cabinets resigned when general elections went against them. Von Brüning's Center party had less than one half the strength of the Social Democratic party in the years 1928-32, but it was von Brüning who was chancellor. Other cabinet downfalls can be so explained. The first, a government of the Weimar coalition—Social Democrats, the Center, and the Democrats—fell after over a year of office (October, 1921, to November, 1922) owing to general weakness and the inability to attach to itself the party just on its Right—the German People's party. The chancellor, Wirth, of the Center party, was too uncomfortably placed to be able to pursue a steady policy without more support. In the second of these cabinets, Stresemann's Great Coalition, which included the previously named parties and his own, the German People's party, it was impossible to keep the parties together for more than seven weeks (August 4 to October 4, 1923), as the Social Democrats refused to give the government a free hand in matters of social legislation. The third cabinet to fall through parliamentary weakness was the Luther coalition of Center parties and German Nationals. This lasted ten months (January 16, 1925, to October 29, 1925) but did not prove strong enough, and a minority government in which the Democrats replaced the German Nationals took its place after six weeks of negotiation, only to fall four months later. The fourth cabinet of this series was similar in composition to Luther's minority government of the Center parties and the Democrats, but with Marx of the Center as chancellor, lived from May, 1926, to February, 1927—that is, for seven months—dying as the result of a vote of no confidence passed by the parties of the Right and the Left—the German Nationals and the Social Democrats. The circumstances of the last two years of the Weimar *Reich* have been explained already (p. 395 above).

*Continuity in Office and Membership of the Reichstag.* There was rather a large rotation of office due to the rapid changes

of ministry. But some members appeared in cabinets again and again, and acquired a large amount of official experience, but it was usually varied, and German practice was far nearer the French than the English in this respect. Though there were twenty cabinets there were only eleven chancellors (von Brüning was chancellor from March, 1930, to May, 1932).

Now, the constitution nowhere provided that the ministers must be members of Parliament. Article 33 gave the *Reichstag* and its committee the right "to require the presence of the Chancellor and any Federal Minister;" while "the Federal Chancellor, the Federal Ministers, and Commissioners appointed by them have access to the sittings of the *Reichstag* and its Committees . . . At their request, the Government must be heard during debate." Here was ample power to secure a due attendance of ministers in the *Reichstag*. The arrangement made it possible for ministers to be chosen outside the circle of members of Parliament. There were undoubted advantages in this, providing the cabinet was, for the large majority, from the body of Parliament itself. It was not wise to attempt to dispense too largely with the process of electoral and parliamentary training and selection. Even if this were not so, we can be sure that members of Parliament would not be prepared to relinquish claims to office. Now, German political experience was the experience of a nation governed by experts. That experience was not forgotten, and it is not yet widely held to have been improper. On the contrary, it was generally agreed that expertness ought to find a place in the cabinet. The result was that though the overwhelming number of cabinet posts went to politicians, some very important ones went to nonparliamentary experts—in all some 24 ministers out of about 150 (in the first 15 cabinets). Luther, for example, was twice chancellor, Minister of Finance, Minister of Justice, and Minister of Food, and even declared himself nonparty. Cuno, another chancellor, was not a member of the *Reichstag*. Finance, Food, Economic Affairs, Transport, the Post Office, and the

War Office, have been held by ministers who were not members of Parliament. This device is used not only to include men who have masterly administrative ability, but also to withdraw bones of contention from the negotiations for a coalition, for, at least, exception will not be taken to these men on the ground that some particular party is receiving an advantage. The holding of the War Office by nonparliamentarians like von Schleicher, an intriguer and for a few days chancellor, was dangerous to the Republic.

*Votes of Confidence.* If we had not been taught that the living constitution may be and is always very different from its written clauses, we might imagine that the Weimar constitution was wise in distinguishing the responsibility of the chancellor and the whole government from that of any one minister, by providing that the chancellor was responsible for main lines of policy and the ministers for departmental policy, and that they must resign should the House withdraw its confidence by express resolution. We saw that Preusz desired the benefit of collective counsel without the disadvantage of a fall of the government when any one minister was to blame. Now, it could have been prophesied that such system could not possibly work, because, having regard to English and French experience, no easy line can be drawn between main lines of policy and the departmental application thereof. We foresaw that it would be impossible, having regard to the close-woven texture of modern governmental business and to the conditions of cabinet making, for a minister to be sacrificed without the cabinet itself falling. These prognostications were realized. Many votes of no confidence have been proposed and three did their fell work—but none was directed against a single minister: all were leveled at the cabinet. Some, but very few, ministers left cabinets because their pet policies did not receive furtherance, or because foreign events occurred with which they did not wish to be officially associated. But individual ministers were not

attacked by express resolution; cabinets stood or fell together.

What, then, was the nature of the votes of confidence? It was agreed among constitutional lawyers of repute that the constitution meant that a government possessed the confidence of the *Reichstag* until this was "withdrawn." The government might, it did, but it needed not, ask for any express vote of confidence upon entering office or thereafter. This latitude was extremely important, because it meant that a cabinet led by a minority party might be tolerated and not overthrown, though no one was really happy about its composition or policy. Meanwhile that cabinet (the von Brüning régime is an example) could make law by the emergency decrees under article 48 (see below, p. 660) and still be tolerated for fear of either dissolution of the *Reichstag* or national disaster.

Now it is clear that there are degrees of confidence and no confidence. The constitution said that ministers must go if there is an "express resolution withdrawing confidence." We who are tactful know that mistrust may be conveyed without the use of explicit terms; we also know that we may avoid the expression of no confidence, and yet safeguard ourselves by not voting in positive favor of a resolution of no confidence—for from such a vote it does not follow that we positively have confidence. Parties in the *Reichstag*, therefore, who did not wish to overturn a government, but who were strong enough to do so (e.g., the Social Democrats *versus* von Brüning from October, 1931, to May, 1932) might and did vote against a resolution of no confidence, without considering that they supported the government, and with involved explanations to their constituents that they did or did not partly or wholly trust the government. Another method of parliamentary trimming was to give a "limited" vote of confidence; that is, assent to one or more activities or to a policy for a specific time. This form of vote of confidence became very frequent owing to the changing relationship of groups and governments. It enabled the parties to in-

jure and weaken the government by substituting "limited" for "full" confidence, and then dishonestly to explain away their position to electors who cannot follow whether their action was right or wrong in the circumstances. The President of the *Reichstag*, Löbe, suggested that the term "*billigen*," which means no more than "to accept," ought not to be used alone to indicate acceptance of a government declaration without the addition of a definite statement of confidence. He believed it would be better to have the French practice, where the government declares that it stands or falls by the voting of a majority for a resolution which it designates. In this way there would be a positive and explicit expression of opinion within the terms set by the government. To me, this seems a very reasonable suggestion.

Had the government to resign if the majority did not vote expressly for a positive resolution of confidence in the government? To abstain from voting, or to vote against, is not an explicit withdrawal of confidence. Only once (Stresemann in November, 1923) did a government resign on the rejection of an affirmative vote of confidence, but that was the only occasion upon which such a vote was rejected; and on that occasion the chancellor had directly challenged a clear vote. Many votes of no confidence have been put by the opposition groups, but only three were accepted, and these led, of course, to the fall of the cabinets involved.

Beyond what we have already said, governments resigned, of course, when their *Reichstag* difficulties made progress with their policy impossible. Their fall was promoted also by differences between ministers. Thus von Schleicher in the last convulsions of the Republic tried a very eclectic coalition on December 2, 1932. He could not have stood, even if the President had not abruptly dismissed him.

On the day when President von Hindenburg appointed Adolf Hitler to be chancellor, the Weimar cabinet system, as well as the whole constitution, may be said to have ceased to exist, for though Hitler did not fully install his own dicta-

torial system for some months, nevertheless the die had been cast, and the era of terror had begun.

The advent of Hitler had many deep-seated social, psychic, and spiritual causes, but one of the causes was constitutional: the constitutional clauses let him in, above all the two-forked split executive. It can be argued that if there had been no von Hindenburg as President, then another President, using the powers that von Hindenburg used, could thereby have kept Hitler out. This is true: but still the constitutional clauses placed authority in the hands of an executive who was only remotely responsible to the people, as against a cabinet with heavy immediate tasks, based on an immediate responsibility to a fluid party and parliamentary foundation.

The President held office for seven years, and was eligible for re-election (article 41). This was in face of a *Reichstag* with a legal duration of four years, and liable to dissolution. More serious in the tests of strength and the conflict of authority was the fact that the president was elected by direct election of the people. This, as in the case of the United States President, gives very substantial moral support to a President: he can always think of himself as at least equal or even superior in authority to a chancellor issuing from no better a popular ocean of will than his own. Indeed, he owed a *duty* to the constitution. This constituted a serious cleft in the will-making authority at the head of the state. The French system is better, precisely because it allows the will of Parliament to dominate the presidency, and because it attempts to bring about a harmony between the cabinets which emanate from it and the Presidency by electing Presidents of no will or of good will. In the complex modern state, with its heavy duties of harmonizing social groups, a constitutionally arranged bifurcation is crass stupidity.

To the President were given, as we have seen, very ample powers of exerting his will in the formation of cabinets, and the dissolution of the *Reichstag*. He could give or withhold from a chancellor the

weapon of dissolution. It was denied to von Brüning, and he was dismissed. It was given to von Papen, because von Hindenburg liked him. It was denied to von Schleicher because von Papen personally persuaded von Hindenburg in December, 1932, to try Hitler rather than to support von Schleicher in his attempts to make and keep a government going. He was given these powers in the articles we have already related; and they became strongly effective because the parties were so disintegrated that he had ample choices for the kind of coalition which should lean on the parties the president liked rather than disliked. Hindenburg leaned to the Center and to the Right—"national," as the term went.

President von Hindenburg had acquired massive strength from three sources: election, reputation, friends. As for election, he succeeded Ebert, the first President, who had served from 1919 to his death in 1925. In the first ballot, in 1925, von Hindenburg was not a candidate. The Social Democrats obtained 7,800,000 votes; the Center party candidate, 4,000,000; a Liberal, 1,600,000; a Bavarian Catholic, 1,000,000; the Right parties' candidate, 10,800,000; Ludendorff, for the fascists and anti-Semites, 200,000; a Communist, 1,900,000. Let it be noticed that in 1925, there were nearly 11,000,000 Right votes; and practically no Hitler votes. If the Left and middle parties had got together, they could have had their own candidate. In the second ballot, the Right parties, smart enough, put forward von Hindenburg. In this election von Hindenburg's war leadership, and his age, and his nonparty position put him at the head of the poll—a "non-political" man to exercise the most political of offices! Here is an index of the civic ignorance and negligence of the German electorate. He polled 14,656,000 votes; the Catholic Center candidate 13,752,000 votes (concentrating the votes of Left, liberals, and middle groups, but losing Protestants to von Hindenburg because the Center candidate, Dr. Marx, was a Catholic); and the Communist Thälmann, 1,931,000. If the Communists

had not been led by Moscow into their steady antiparliamentary attitude, their votes could easily have turned the tide, and Thälmann would later never have died in Hitler's concentration camp, or Russia been devastated by Hitler's legions. (Perhaps.)

The years 1925 to 1929 had been good ones for the *Reich*. By 1932, however, the full force of the depression had brought the blackest despair, and with it, had stimulated the advance of Nazi votes. Hitler was drawing to himself all the discontented groups, discontented about anything whatsoever—but especially those discontented about the nationalist humiliations in the Treaty of Versailles and about Germany's military weakness and inferiority, and the desperate unemployed and anti-Communist strata. The streets were already full of Nazi-Communist murderous clashes; parliamentary proceedings had become a farce as the extreme wings interrupted the sessions with disorder and actual pitched battles. Von Brüning had had to rely on the President's confidence to keep him in office, and to govern by the issuance of decrees, under the toleration of enough votes (heavily Social Democratic) to avert a vote of no confidence. Hitler was put up as Presidential candidate. The Social Democratic votes went to von Hindenburg; the results were von Hindenburg, 19,400,000; Hitler, 13,400,000; and Thälmann, the Communist, 3,700,000. Brüning—who had been sustained by von Hindenburg, as chancellor—and his Catholic Center party were fighters for von Hindenburg—now 80 years old and hardly able to attend to business for any stretch of time in the day.

The power of the President was amply supported by these votes. He possessed three powers of outstanding constitutional importance: the power to select the leader of the cabinet; the power to sustain him with his decree-making power under article 48; and the power to dismiss the chancellor. It is necessary to examine the nature and use of the latter two powers.

*Article 48 and Emergency Decrees. Ar-*

ticle 48 concerned two things: one, the power of the *Reich* to enforce *Reich* law on the states if these did not duly execute them. That is not important in this context. The clauses that are significant read thus:

When security and order in the *Reich* are seriously disturbed or endangered, the *Reich* President can take measures necessary for their restoration; if it is necessary, he may intervene with the use of armed forces. For the purpose of restoring safety and order, he may temporarily suspend, wholly or partly, the fundamental rights in the Constitution in Articles 114, 115, 117, 118, 123, 124, and 153.

The *Reich* President shall without delay inform the *Reichstag* of any measures taken by virtue of the first and second paragraphs of this article. At the request of the *Reichstag* such measures must be rescinded.

Particulars are determined by a *Reich* law.

The details never were so determined, so that there was lacking a second official opportunity for the consideration of the scope and gravity of the article, when, if necessary, it could have been better defined. The first opportunity had been available before the constituent assembly; but there was surprisingly little discussion of so vital an article, perhaps because the times were turbulent and a birch-rod in the cupboard implicitly desired, and because the deputies may have thought that the *Reichstag* was master and some day would make precise all that was still vague. One deputy, an Independent Socialist, foresaw that the safeguards of submission of the decrees to the *Reichstag* would be insufficient as a safeguard, and warned desperately against the coming of a President who might be antidemocratic.

This article looks as though it were concerned only with riotous or military situations, like those permitting martial law in Britain or a state of siege in France, or permitting the United States President to use his powers as commander-in-chief of the forces. But it was sufficiently nebulous in terminology, and new in its establishment in a young democracy, in a land used to authoritarian executives, that it could be and was used, *first*, to restore physical order. But when the economic

situation became difficult, and above all, when there was no chance of getting a parliamentary majority for necessary policies, economic and social, it was used, *second*, to make laws on taxation, unemployment pay, rents, assistance to agriculture, harvesting of crops, banking, price regulation, tariff schedules, corporation laws, and many other matters of the highest controversial and political nature. Chancellor von Brüning did not commence this practice, but he powerfully used it. In this he was supported by von Hindenburg, who had come to like him, and the *Reichstag* did not reject the decrees by a vote of no confidence. During the adjournments of the *Reichstag*, the chancellor was virtually without responsibility to anyone except the President for such decrees.

Thus arose the practice of so-called "presidential cabinets"; that is, cabinets having no positive support by a majority in the *Reichstag*, legislating by the use of the Presidential decrees, tolerated by the *Reichstag*. By 1932, the President was fully imbued with the idea that in the uproar and depression and parliamentary disintegration, it was right and proper and constitutional to use the power in this wise.

Add one other factor. The President named the chancellor; the *Reichstag* was supposed to support the cabinet; the cabinet must leave office if the *Reichstag* withdrew its support positively; but the President could dismiss the chancellor. The relevant article (53) reads:

The *Reich* Chancellor and on his proposal the *Reich* ministers are appointed and dismissed by the President.

Hence, when the arch intriguer von Papen, a World War I spy, a member of the Catholic Center, and a Junker, wormed his way into the confidence of the senile von Hindenburg, he induced him suddenly, in May, 1932, to dismiss von Brüning. Then followed a von Papen cabinet, uncongenial to the *Reichstag*. Von Hindenburg gave von Papen the dissolution he had refused to von Brüning. Von Hindenburg and von Papen were

prepared to offer Hitler seats in the cabinet. Hitler corresponded with von Hindenburg, who refused to give him the chancellorship for which he held out, with the backing of the president for another "presidential cabinet" backed by article 48, for the Nazis could get no parliamentary majority either.

The elections in November again returned an impossible chamber, with the Nazis in the lead. Von Hindenburg refused Hitler once again, but at the same time von Papen and the President himself were kindly toward the Nazis, repealing for their advantage the decree against private uniforms and the Nazi Storm Troops. Violence rose in a murderous crescendo. The pair at the top ousted the Prussian Socialist cabinet on the excuse that it could not keep order, all under article 48. When the *Reichstag* met in August, 1932, von Papen was overthrown by the largest majority in Weimar's history, 510 against 42. A dissolution followed. The Nazis were still the largest block of voters and holders of *Reichstag* seats, but they lost heavily in the November elections, in part because the Prussian *coup* had been contested before the Supreme Court and the proceedings had clearly shown the corrupt and brutal nature of von Papen and Hitler. Even von Hindenburg was affected by these events, and von Schleicher was given von Papen's place as chancellor. At this von Papen joined Hitler. Out of personal hatred he persuaded von Hindenburg to dismiss von Schleicher. Von Schleicher could not get a *Reichstag* majority, and so the Catholic von Papen argued that Hitler in combination with the German Nationals might make a viable government. Von Schleicher was dismissed: Hitler was appointed chancellor.

#### HITLER'S EXECUTIVE

OF course, under section 3 of the *Reich-ministers* Law (March 27, 1930), Hitler took the oath of office to "abide by the Constitution and Laws of the German People."

Ostensibly as an answer to the *Reichs-*

tag fire, von Hindenburg issued a decree under article 48, suspending the constitutional guarantees—freedom from arrest; free expression of opinion; freedom of the press, association, and meetings; the secrecy of letters, posts, telegraph, and telephone; judicial control of search warrants; and protection of property.

The Enabling Act of March 24, 1933, followed. Henceforward, all laws, including financial, might be enacted by the government, whether they were of a constitutional nature or not. The *Reichstag* thus became a facade. All laws thereafter were decrees of the cabinet. The *Reichsrat* was abolished. The *Reichswirtschaft* was outlawed. When von Hindenburg died on August 2, 1934, a decree of Hitler's cabinet merged the chancellorship and the Presidency: the dual role was ratified by a plebiscite a couple of weeks after von Hindenburg's death. In July, 1935, the title of *Führer* replaced the dual title. It would be an act of pedantry to enter into the detail of the organization of this dictatorship in which the constitution of the dictator and of his Nazi party became the constitution of Germany and was within an ace of becoming the constitution of the whole western world. The eight volumes of *Nazi Conspiracy and Aggression*, the documents produced in the Nuremberg war-guilt trial, contain the elaborate picture; Volume IV is especially concerned with the organization of the cabinet and the party,<sup>8</sup> while Supplements A and B contain the succinct closing addresses of prosecuting counsel and the defence, each, in his own way, describing the foulest behavior in human annals.

The general outline may be given. The principle of the system was "All respon-

sibility upwards and all authority downwards," the summit being the leader of the state and the leader of the party.

The constitutional power to make laws outside the *Reichstag*—added to the chancellor's powers to make decrees and to govern, combined with the powers of the President as prescribed by the Weimar constitution—concentrated in Hitler's hands all power of every kind: executive, legislative, and judicial, and command of the armed forces (Law to Remove Distress of People and State, March 24, 1933; Law on Sovereign Head of the German *Reich*, August 1, 1934). The separation of powers was rejected and indeed scoffed at. The Minister of Justice, Dr. Frank, declared:<sup>9</sup>

This measure means a turning away from the liberal principle, of the separation of powers in reuniting the legislative with the executive power, and on the other hand a turning away from parliamentarism, since the self-responsibility of the leading personalities has taken the place of anonymous resolutions in the legislature.

The laws, with a few exceptions when the *Reichstag* was permitted to assent to the projects introduced by the *Führer*, were made by simple ordinance and promulgation. The more fundamental ones were drafted by the Minister of the Interior, and submitted to the cabinet. Others were drafted by the minister in charge of the particular department, were then sent to all members of the cabinet, and after a lapse of time for objections were considered to have been passed by all. Cabinet meetings were rare: there were meetings between the *Führer* and the men he wanted to see. A decree of his own set up a private cabinet for high policy, defense, and foreign policy. The laws were signed by the *Führer*, and were usually countersigned by the appropriate minister or ministers. The function of this countersignature was in reality nugatory—it was but a relic. Yet it was theorized about, as everything had to be theorized about that the dictator suffered to

<sup>9</sup> In *Zeitschrift der Akademie für Deutsches Recht* (February, 1937).

exist by accident. Countersignature was supposed to maintain the responsibility of the ministers to Hitler: to vivify them by the idea that they also were "*Führers*" not merely clerks; and to produce a team spirit, where there was no team. For the theory supplied by the obsequious professors was that this was no "chancellor system" as had existed, nor a "prime minister system," but something especially heaven-dispensed.

This system of irresponsible political direction was supported by a number of pillars, chief of which were (1) the unity of party and state; (2) the control of the civil service; (3) the control of the judiciary; and (4) the fighting toughs and secret police.

(1) The Nazi party was given a monopoly of political life. The Law Prohibiting the Formation of New Political Parties, of July 14, 1935, prescribed:

The National Socialist German Workers' party is the only political party in Germany. Whoever undertakes to maintain the organization of another political party, or to form a new party, is punishable by hard labor up to three years or imprisonment from six months to three years, unless the action is punishable by a higher penalty under other provisions.

To get out of a jail was impossible once in it: and the "higher penalty" referred to was the interpretation of sedition and criminal activities established by the Nazis and rendered by the ordinary courts, or, more, the People's Court, which sat in secret and was manned by party members, especially the SS men. Further, the law of December 1, 1933, declared the party to be "the bearer of German political sovereignty, inseparably intertwined with the state." Its status (by this law) of "corporation of public law" gave it certain immunities in its property and activities because actions against it were triable in the administrative courts with a favorable jurisprudence to its purposes. The chancellor was leader of the party, and its supreme lawgiver and disciplinarian. He normally operated through a deputy: the vile Martin Bormann.

The deputy leader of the party was an

*ex officio* member of the *Reich* cabinet. He participated in making the laws. He reviewed all nominations for high administrative and political offices. His local subordinates at all levels of government downward territorially had the same power of control, nomination, and rejection. (Cf. p. 210 above, on the position of the states and municipalities.)

Fitted into the party were various pillars and auxiliaries: the *Sturmabteilungen*; the *Schutzstaffeln*; the Students', Women's, and Physicians' associations. They were fighting militias. They had access to the best jobs. They were spies and denouncers of their fellow-citizens and professionals: for spying and denunciation were cardinal party duties. (Law, March 29, 1935, and Law of the Deputy of the *Führer*). The party members benefited from the rules of *lèse majesté*. They were bound to report contemptuous remarks about the party, and especially to resist open attacks upon it. To the SA and the SS certain rights of immediate self-defense were given. Within the party, strong discipline prevailed, all from above, administered in courts within the party. Action on the state by the party was confined by the decrees of the *Führer's* deputy to the channels ordained by him.

(2) The controls over the civil service have already been noted (p. 302 above). The exaction of loyalty to the *Führer* was personal and total. For example, article 3 (1) and (2) of the Civil Service Law of January 27, 1937:

A position in the public service is proof of confidence on the part of the state leadership, which the official must justify by being constantly aware of the added duties—which his position imposes upon him. *Führer* and *Reich* demand of him true patriotism, a spirit of self-sacrifice, and complete dedication of his efforts, obedience to his superiors, and comradeship towards his colleagues. He must be a model of loyal fulfilment of duty to all his fellow citizens. He must be faithful unto death to the *Führer* who assures him his special protection.

The official must at all times support without reservation the National Socialist state and in all his behavior must be guided by the fact that the Nazi party, in indissoluble union with

the people, is the basis of the German idea of the State. He must report to his superiors occurrences which might endanger the existence of the *Reich* or of the Nazi party, even when he has not learned of them in the course of his official duties.

(3) In the German system of government, the judges were civil servants, but the Weimar constitution required that they should be independent, obeying only their judicial conscience. But the theory of the Nazi state, presented to the courts from time to time and not infrequently by the Minister of Justice to the Nazi organization of lawyers, was that the Nazi movement superseded the Weimar constitution, in so far as laws and decrees canceled or altered its terms, and above all in so far as the will of the movement was expressed in the *Führer's* speeches. Hence, the judges were now subordinate to the *Führer's* will, and the "healthy popular feeling" about law was to prevail over judicial scruples based on the written statutory or case law. Dr. Frank, Minister of Justice, declared: <sup>10</sup>

The Judge is not placed as a sovereign authority in the State above the citizen, but is a member of the living community of the German people. It is not his duty in enforcing law, to impose on the community of the Volk or to resuscitate ideas of universally recognized values [that is, natural law concepts—*author*] but to safeguard the very definite order of the national community, to eliminate dangerous elements, to prosecute all acts which harm the community, and to reconcile all differences between the members of the community. . . . The Judge has not the right of judicial review of decisions made by the *Führer* and issued in the form of law or decree.

(4) Finally, the SS was a special corps of Hitler's toughs, the militia of the régime, chosen for purity of blood, with weight, height and girth prescribed—the equivalent in the twentieth century of Frederick William's tall grenadiers of the seventeenth, but more murderous and assigned for special duties. They were closely interwoven with the Gestapo, or secret police, headed by Himmler: the torturers, mur-

derers, concentration-camp maintainers, spies, informers, and the rest. Of these the Law of February 12, 1936, said: <sup>11</sup>

The duty of the Secret State Police is to expose and oppose all social forces which are dangerous to the State, to collect and evaluate the results of these discoveries, to inform the government and keep the authorities of all kinds informed. . . The orders and business of the secret state police are not subject to review in the administrative courts.

This barbaric despotism wrought its wickedness in the midst of Europe unmolested from January, 1933, until September, 1939, when, much against their will, Britain and France were forced to preserve themselves against it. Nor did the United States challenge it by force, and hardly by words, until some time in 1941. The Soviet Union had even become allied with it in August, 1939. Those who connive are themselves besmirched.

The arms and the lives sacrificed to liberate the nations of Europe and the U.S.S.R. from the black, murderous tyranny of the nazis and all who connived at their wickedness or supinely condoned it also liberated the German people from themselves and the compulsions and cruelties within them. The grand question is whether, when the occupying powers leave, they can govern themselves in liberty and cease to hanker after the destruction of the liberties of other peoples. It is in doubt.

#### GENERAL SURVEY OF EXECUTIVES

THE analysis of the executive brings to light certain truths. It is obvious that a nonresponsible government is impossible and dangerous, save for very exceptional moments in the life of the modern state. Responsibility to some body representative of the people is needed as much for the well-being and capacity of the leader as for the enforcement of a sense of responsibility. Loss of office is, in the western world, at least a sufficient sanction of responsibility, while impeachment and

<sup>10</sup> *Nazi Conspiracy and Aggression*, Vol. V. Much of this is execrably translated.

<sup>11</sup> *Ibid.*, Vol. V, pp. 346 and 456; and Vol. IV, pp. 193 and 732.

civil and criminal liability are either unnecessary or too grave to be used. Responsibility of this kind admitted, the problem becomes one of finding the best conditions of centrality in leadership. The two chief methods are the parliamentary cabinet and the nonparliamentary President. There is every reason to believe that the parliamentary cabinet is far superior to the Presidential system; indeed, the latter has nothing which can be urged in its favor except the very devices which are desperately invoked to overcome its inherent defects. It is possible to concentrate to such a fine point that all the benefits of collective counsel backed up by the weight of a political following are lost. On the other hand, in the French and German cabinet systems, parliamentary committees dispute executive leadership, and contribute to the obscurity of responsibility, and this, if possible, is to be avoided, as it is in the British system. Modern cabinets are overburdened, and to meet their obligations they use expert commissioners to help them in debate and explanation and expert technicians either in the form of a council or as individual attendants upon the cabinet, and their rules of business are more and more being adapted to the complexity and intricacy of their work. Not all of them are as rationally organized as is necessary. Collective responsibility rather than individual responsibility is an almost inevitable consequence of the inseparable web of all government business—and the vital importance of each part of a government's policy to the rest—and besides this, indubitable indication of responsibility is only possible where a unit confronts the legislature and the people.

The sources of healthiness or unhealthiness in cabinet government are to be traced to the party system, for this connects the government and the parliament, and the government and the people, and the government and the opposition. Of all the systems we have analyzed, the English by good fortune and the predominance of political ability over other spiritual dispositions, have produced the best. In other countries representative govern-

ment in general (and the parliamentary executive in particular) has fallen into contempt. In some it ran the serious risk of replacement by a dictatorship. In a few, it has already been replaced by dictatorship, because the fragmentation and number of parties, and their mutual intolerance based on grounds of policy or personal egotism, result in a most disturbing instability of the executive. This experience provides a fresh criterion of the nonparliamentary executive of the United States—for at least, whatever the shortcomings of that system, the executive is fixed for four years, and stability is a tremendous advantage in the modern world of highly sensitive industrial, commercial, and financial human relationships based upon continuity of operation, credit, and meticulous calculation of the future. A moment's consideration of the effect on industry of taxation, tariff, and employment policy will teach that.

Yet the executive, as we have treated it, lacks the final touch: that is, an understanding of the part which the chief of state plays in the process of government. We have already indicated that the members of the cabinet, especially the prime minister, attract loyalty by reason of their high status as well as by their utility. They are credited with being more than they are because they are where they are. Men and women defer to Presidents and Kings, even when these are in fact able to do far less than that with which they are credited.<sup>12</sup>

#### THE EXECUTIVE IN THE U.S.S.R.

THE student will notice in Table 21 that there is a kind of duality in the system of the U.S.S.R., with "executive" functions divided between Presidium and the Council of Ministers, until recently called the Council of People's Commissars.

The mechanism is thus constituted. The Soviet fresh from the elections elects forty-two members from its midst: one of them thereby becoming President of the Soviet

\*This is avowedly a rough sketch for what it is worth: no one may use it without all the textual qualifications in mind.

Union; among the others are ample vice-presidents to represent the various republics. Its authority extends to the issuance of edicts between meetings of the Soviet, so that, as the latter are few and far be-

tween, it is the continuing lawmaking body of the land. "New law" is to be made by the Soviet—but what that is nobody has defined, except that comprehensive planning legislation is submitted to the

## THE EXECUTIVE IN THE U.S.S.R.

Soviet for approval, and the budget goes to it also, for debate. The virtual power of lawmaking is thus in the hands of the Presidium. Furthermore, it interprets the laws. It convenes the Soviet twice a year, for as long as it wishes. It is never enough for the real work of legislation. It has the power of removing and appointing officials, including the Council of Ministers between sessions of the Soviet. Thus, save for some formal ratification of the action of the Presidium in the selection and dropping of ministers, the shaping of the cabinet and its entire control therefore lies with the Presidium. The other powers will have been noticed in Table 21. The Council of Ministers is a cabinet, with collective purposes, and with individual responsibility of ministers for their special departments. The departmentalization is highly developed, since the state is in command of most of the activities and thoughts of the people of Russia: at the moment there are the chairman, Stalin; eight vice-chairmen; and forty-five ministers. Both Presidium and ministers

are answerable to the Soviet. As these two bodies, in their Communist party roles, have chosen the members of the Soviet, by means of their control over the party, and as the Soviet meets for so brief a time with so heavy an agenda of applauding speeches before discussion and vote, answerability is a fiction.

Rather more important to notice are the tight organizational bonds which link Presidium, Council, and Politbureau of the Communist party, fully facilitating the dynamism and control of the last over and through the other two.<sup>13</sup> The Politbureau is all-Communist, and quintessence of Communist; and the other two bodies are fully Communist also. But, even more important, some leaders hold office simultaneously in Presidium, Council, and Politbureau—one head that thinks for three and assures Communist party sovereignty.

---

## *The United States Presidency*

### THE UNITED STATES PRESIDENCY

THE power, spiritual and physical, lodged in the people and government of the United States prodigiously outweighs that of any other nation in the world, far beyond that of any other democracy. The domestic use of this power for America's own internal economic well-being also increases or destroys the daily bread of hundreds of millions of foreign men, women, and children beyond her borders. The exercise of her might in the international congregation of seventy independent states, through friendly acts or pressure on the will of some of them, governs their independence and their security, and helps to settle whether their institutions shall be more or less democratic in spirit. Since the United States is transcendently mighty, her constitution is by so much more a ruling force in the constitutional life and fate of all other peoples no less than of her own.

It can never fail to be a matter of profound anxiety on the part of the rest of the world, or of the 150 million Americans, that the American system of government disintegrates the leadership of Congress, and then largely stakes the fate of itself and the world of nations with which it is merged by physical oneness, upon the character and ability of one solitary man in the White House: that is, upon an accident. It is not a little terrifying to think that though the stakes are so high, ruin as well as bliss is risked on a single throw.

It is not intended here to make an elaborate analysis of the chief executive, as the history and concrete circumstances are readily available.<sup>1</sup> It is, however, urgent to assess the functional strengths and weaknesses of the institution, especially in comparison with foreign executives.<sup>2</sup> The

<sup>1</sup> The chapter is founded (1) on the well-known standard biographies, autobiographies, and diaries of the Presidents—e.g., Grover Cleveland, *Presidential Problems* (New York, 1904)—and some of the cabinet officers, e.g., Gideon Welles; (2) on the historians of particular Presidents or cabinets, like J. C. Randall, *Constitutional Problems under Lincoln* (New York, 1926), or Burton J. Hendrick, *Lincoln's War Cabinet* (Boston, 1947), or J. P. Tumulty, *Woodrow Wilson as I Knew Him* (New York, 1921), or A. S. Link, *Wilson on the Way to the White House* (Princeton, 1947), or Arthur Schlesinger, Jr., *The Age of Jackson* (New York, 1945); (3) on the documents on origins like Max Farrand's *Records of the Federal Convention* (New Haven, 1911), fully exploited in Volume II, chapter XXIII, of the two-volume edition of this work; (4) on studies like C. C. Thach, *The Creation of the Presidency* (Johns Hopkins, 1922), and N. J. Small, *Presidential Interpretations on the Presidency* (Baltimore, 1932), H. B. Learned, *The President's Cabinet* (New Haven, 1912), and M. L. Hinsdale, *History of the President's Cabinet* (Ann Arbor, 1911), and J. Hart, *The American Presidency in Action, 1789* (New York, 1948).

<sup>2</sup> Our understanding has been enriched by the studies of the Presidency as an office, such as E. S. Corwin, *The Presidency*, 2nd edition (New York, 1948); W. E. Binkley, *The President and Congress* (New York, 1947); E. P. Herring, *Presidential Leadership* (New York, 1940); and the reminiscences of Frances Perkins, *The Roosevelt I Knew* (New York, 1947); Henry L. Stimson and M. Bundy, *On Active Service in Peace and War* (New York, 1948);

illustrations chosen, are, for impressiveness, contemporary, but the generalizations are rooted in the development of a century and a half.<sup>3</sup>

The American Presidency has six outstanding characteristics:<sup>4</sup>

It is a "made" executive, but it has grown;

It is a "solitary" not a "collective" executive;

It is popularly elected, in practice directly;

It is more than an executive;

It is separated from Congress;

It may be tinkered with, but cannot be reformed.

#### A "MADE" EXECUTIVE

THE authority of the Presidency has verbal bounds, since the executive was created and defined in writing by the constitutional convention. Most of the authorizations are specific. It was the general

James Farley, *Jim Farley's Story* (New York, 1948); Robert Sherwood, *Roosevelt and Hopkins* (New York, 1948); Harold Ickes, *Twelve Years with Roosevelt* (New York, 1949); Cordell Hull, *Memoirs* (New York, 1948).

<sup>3</sup> Cf. chapter on the Presidency in Vol. II of the original edition of the present work.

<sup>4</sup> For the more immediate problems of fitting the Presidency to his contemporary responsibilities it is necessary to consult: Symposium, "The Executive Office of the President," *Public Administration Review*, Winter, 1941; Harold D. Smith, "The Budget as an Instrument of Executive Management," *ibid.*, Summer, 1941; and N. M. Pearson, "A General Administrative Staff to Aid the President," *ibid.*, Spring, 1944; Paul Appleby, "Organizing around the Head of a Large Federal Department," *ibid.*, Summer, 1946; Louis Brownlow, "Reconversion of the Federal Administration Machinery," *ibid.*, Autumn, 1946; "Symposium on Federal Executive Reorganization," by Wayne Coy, J. P. Harris, and Don K. Price, *American Political Science Review*, December, 1946; Charles E. Merriam, "The National Resources Planning Board," *ibid.*, December, 1944; F. Morstein-Marx, "The Bureau of the Budget," *ibid.*, 1945, pp. 653 and 869 ff.; F. Morstein-Marx, *The President and his Staff Services* (Chicago, 1947); Lindsay Rogers, "The American Presidential System," *Political Quarterly*, Oxford, October, 1947, and, most recently, the Reports of the (Hoover) Commission on Organization of the Executive Branch of the Government, February-March, 1949.

—though by no means unqualified—intention of that body to establish an executive of assigned powers, not a general residual executive with "inherent" powers and a "prerogative,"<sup>5</sup> as had emerged over the centuries of constitutional battle in Britain and the Continental states. The states, under colonial rule as when they asserted their independence, were resolved on a subdued executive and a dominant legislature.

The "executive power" is vested in the President. He is commander-in-chief of the armed forces of the United States, and of the militia of the several states, when called into the actual service of the United States. He has the power to require the opinion in writing of the principal officer in each of the executive departments. He has the power of reprieve and pardon. He has the power to make treaties, with the advice and consent of two thirds of the Senate. To him is granted the power to nominate—with the advice and consent of the Senate—ambassadors, other public ministers and consuls, judges of the Supreme Court, and all other officers of the United States whose appointments are not otherwise provided for, which shall be established by law (but Congress may vest the appointment of these latter officers in the President alone, in the courts of law, or in the heads of departments). He is vested with the power to fill vacancies during recess of the Senate by commissions expiring at the end of their next session. Then, too, he is assigned the duty of giving Congress information on the state of the Union and recommending to their consideration such measures as he shall judge necessary and expedient. He may convene extraordinary sessions of the Congress. He has the obligation of receiving ambassadors and other public ministers. "He shall take care that the laws be faithfully executed." He shall commission all the officers of the United States.

This is a "made" executive: that is to say, one which was deliberately designed

<sup>5</sup> Cf. W. R. Anson, *Law and Custom of the Constitution* (Oxford, 1935 edition), Vol. II, Part I, "The Crown," Chapter I.

to take a certain place, a limited place, in a constitution along with other powers also defined. But, quite apart from the intentions of the constitutional convention, the terms of his authority are elastic, for they are in words, general words. Thus, "commander in chief"—on what occasion, when, and for what purposes? Thus, "the executive power"—is the model the European or the British king? Does executive power reach beyond the confines of the list of specific grants? What of the recommendation of measures to Congress?—in person, or by transmitted written message?—advocated with what force, authority, and instrumentalities (for "recommendation" could be rhetorical or perfunctory)? The reception of ambassadors, their appointment, the making of treaties—these can combine in a weighty power. And, finally, the obligation to see that the laws are "faithfully executed"—how vast a discretion to energy or laziness, to zeal or apathy, to courage or timidity, to coordinative power or administrative fecklessness, to width and force of managerial drive and political marshaling of forces for success, or to negligence and ineptitude! Nor is this by any means the end of uncertainty—of closure or opportunity of effective initiative. For one great party grouping, anti-Federalist, Whig, Republican, in 1789 and thereafter, resolutely affirmed and fought for the supremacy of Congress and the subserviency of the Presidency. Thus, Thaddeus Stevens's claim in 1862<sup>6</sup> was but the intenser echo of doctrines first uttered in 1788:

We [Congress] possess all the powers now claimed under the Constitution [that is, Lincoln's claims!] even the tremendous power of dictatorship.

The Presidency is very largely what the incumbent is willing and able to make it, taking account of the problems and conditions of the time. Jefferson, Jackson, Lincoln, Hayes, Cleveland, McKinley, Theodore Roosevelt, Woodrow Wilson, and Franklin Delano Roosevelt made it

a center of the most active and effective governmental leadership. In theory and practice, or simply in practice, they proceeded on the view that they could do all that a political situation demanded, in the public interest, that was not forbidden by the constitution or that did not conflict with some other institution like the courts or Congress to whom the constitution had assigned definite powers. "The situation demanded"—it demands and offers what the founding fathers never dreamed of.

Theodore Roosevelt's claim is the most assertive and Franklin D. Roosevelt's the most elevated. The former founded his administration on

my insistence upon the theory that the executive power was limited only by specific restrictions and prohibitions appearing in the Constitution or imposed by Congress under its constitutional powers. My view was that every executive officer, and above all every executive officer in high position, was a steward of the people bound actively and affirmatively to do all he could for the people. . . . I decline to adopt the view that what was imperatively necessary for the Nation could not be done by the President unless he could find some specific authorization for it.<sup>7</sup>

Franklin Roosevelt, taught by the unprecedented experience of connection with the White House from youth, experienced in the governorship of New York, and inspired by the plight of the "forgotten man," declared within a few days after his election in November, 1932:

The Presidency is not merely an administrative office. That is the least part of it. It is more than an engineering job, efficient or inefficient. It is preeminently a place of moral leadership. All our great Presidents were leaders of thought at times when certain historic ideas in the life of the nation had to be clarified. . . . Isn't that what the office is—a superb opportunity for reapplying, applying in new conditions, the simple rules of human conduct to which we always go back? . . . Without leadership, alert and sensitive to change, we are all bogged up or lose our way.

In a poll conducted and appraised by

## 'SOLITARY' EXECUTIVE

Professor A. M. Schlesinger,<sup>8</sup> six Presidents were judged as "great": Lincoln, Washington, F. D. Roosevelt, Wilson, Jefferson, and Jackson, in that order. The common quality of their greatness, admitting many imperfections in the minor arts of administration and political tactics, was their soaring moral élan endowed with the native might to sweep masses into their swift flight towards answers to crises that supplied durable unity, freedom, justice and welfare to the whole nation.

### A "SOLITARY" EXECUTIVE

THE constitutional convention desired to secure an unmistakable focus of responsibility and avoid confusion; and to encourage vigor and despatch in judgment and decision. The weak colonial governors were in disfavor. Hence no plural or collective executive, like a cabinet or council of ministers, was established, though it must never be forgotten that a multiple executive was proposed only to be dropped for reasons not fully reported in the records of the convention.

All constitutional responsibility is focused on one man and one man alone. The constitution even provides for his impeachment. The consequences are interesting and dangerous.

No collective responsibility in a group of men equal in status, with perhaps some ascendancy in a prime minister, was sought. None has developed. Something called the President's cabinet, always including the ten departmental heads and usually others, was evolved. Yet, in reality, no cabinet exists, in the sense of a constitutionally responsible multiheaded council for the exercise of the chief executive's power. The cabinet is a mere collection of Presidential minions, "clerks" as they have been called. The President's will is supreme, whatever they may advise, because his responsibility is sole and plenary. Indeed, it is rare that the cabinet is called together; rarer still that it discusses major issues; and prac-

tically never that it makes a corporate decision. The President makes up his own mind, whatever the votes—when, indeed, votes are taken.

The talk of a cabinet, then, is specious: it is a cabinet at a meeting to hold conversations, perhaps at times to deliberate, but hardly ever to create a collective will that shall govern all including the President. The President floats above it, and aloof. He is not merged in a team; he is detached.

Though business may be distributed, partly by the Presidential wish and his general executive power, and partly by statutes of Congress which vest various administrative powers in the several heads of departments, no real sharing of authority occurs. That this weighs on the Presidential mind can be inferred from many utterances and action taken by all the Presidents. Franklin D. Roosevelt offers a particularly significant illustration among hundreds. At a press conference on December 20, 1940, he said:<sup>9</sup>

There were two or three cardinal principles; and one of them is the fact that you cannot, under the Constitution, set up a second President of the United States. In other words, the Constitution states one man is responsible. Now that man can delegate, surely, but in the delegation he does not delegate away any part of the responsibility from the ultimate responsibility that rests on him.

We have called this a particularly significant example because precisely this statement was seized upon by Roosevelt's political opponents on the Joint Committee of Investigation of the Pearl Harbor Attack, in order to fix on him the prime responsibility for that lamentable event, and they quote his words in evidence against him.<sup>10</sup> Every President is personally liable to be smitten in conscience, self-respect, and political reputation, by the boomerang of his own delegation of authority; responsibility—that is, punishability—is inescapable. He distributes

<sup>8</sup> Cf. *Public Papers*, 1940, p. 623.

<sup>9</sup> *Paths to the Present* (New York, 1949), p. 96.

business, or Congress does, but, whoever acts, he alone takes political responsibility. He therefore is careful not to devolve authority, which still attaches to him. It is always only a distribution of business. For whatever may be the actual demonstrable errors of his cabinet heads, political blame will come back to him. The President takes the greatest political risk in surrendering some of his authority into the keeping of others. If he is a conscientious man, this is a painful strain on him. He is torn between the impulse not to share power with others, though he has so crushing a burden himself, and the impulse to give it and then feel that unless he watches its use closely, Congress and public opinion will make him smart with blame. Congress may have given power and responsibility to a departmental chief, provided him with funds, instructed and encouraged him at its hearings yet since the President bears responsibility for executive competence, he cannot find relief from departmental concern, for he cannot cut the knot the constitution has tied.

It is an impossible burden. And, in fact, it cannot be borne in a governmental system so widely and deeply active as the American of the twentieth century is obliged to be. Too much responsibility paralyzes the will, for the imagined consequences are too fearful. An excessively concentrated accountability causes incomplete devolution of work to subordinate agencies, and a process of frantic intrusions and exits, by the chief executive, in the alternations between relief and accumulating anxiety. When the President is a weak man—which by the bargaining, contractual, almost casual, nature of the forces producing a nomination, he is liable at any moment to be—the pitiable man is reduced to a frightened whistling for courage, and policy to collapse.

The constitution and its conventional apparatus have provided him with no one he can fully trust; no one to lend him acceptable and dependable counsel; no one to encourage him with the sincerity that comes when a colleague's political fate is bound up with the results of the encour-

agement he gives. How much easier is the British cabinet minister's task, and how much lighter the prime minister's, even though the latter's power is not reduced and limited by any federal division of power, or checks and balances, or the exclusion of some matters from governmental jurisdiction altogether, as under the United States constitution.

It is not to be wondered that Presidents have been obliged to set up "kitchen cabinets" and "brain trusts" and "Assistant Presidents." In their constitutional loneliness they must confide in some one. In more fortunate circumstances they might have had a group of political party colleagues on whom they could rely, on whom they might have been compelled to rely. But the political parties are loose and divided; they have not been tightened up by a constitutional provision which would have been astringent to them by calling for a responsible *collectivity*, the top leadership of the party, as in the British government. Therefore Presidents have given and taken their confidences through personal friendships. By their nature these may be constant, or inconstant; competent or incompetent; lasting for days or months, not so often for years. The President does not look merely for ability, but for the signs of congeniality and trust—the small man in his way, with old-time small-town cronies, the great man, like Franklin D. Roosevelt, among the élite of intellect and character. Instead of decision by cabinet, we have decision by tête-à-tête. Notice how, on the death of one President, and the succession of the Vice-President of that same party, the former's departmental chiefs flee Washington, while the new chief executive brings in his own "gang." Frances Perkins's description of the Roosevelt cabinets<sup>11</sup> fits the stories of previous Presidencies and corroborates that given verbally to the present author by other members of Roosevelt administrations.

But as the years went on, Roosevelt's cabinet administration came to be like most previous

<sup>11</sup> *The Roosevelt I Knew*, p. 37

ones—a direct relationship between a particular cabinet officer and the President in regard to his special field, with little or no participation or even information from other cabinet members. Certainly almost no "cabinet agreements" were reached. Something about our governmental form and the tensions between the legislative and executive functions seems to make fully responsible cabinet action unlikely.

This account is corroborated by circumstantial stories. The effect of the last man in to see the President is most often decisive. The disputant who appears at the White House, as contrasted with the other man who stayed away, wins a superior influence.<sup>12</sup> Cabinet members take deliberate care to safeguard their departmental concerns from cabinet discussion, with mutual understandings for suppression. One of those especially trusted by the President lunches with him weekly. Here is a fortuitous assemblage of regional, local, sectional, vocational, and "party" chieftans, each with his own fief; some, but few, with broad views of policy; some, but not all, loyal to the President's person and comprehending the import of his policy. They have come into politics for a time; they do not expect to stay; they will retire soon because they are sick or disagree with the President or are merely unwilling to shoulder an unprofitable burden or wish to repair their fortunes in their private business. Or they will cling to office, despite disagreement with the President, useful or not to the public welfare, and the President will not eject them as early as the public good demands because he may offend the chieftain's followers or clients, and so lose support in Congress or popular votes if he contemplates a second term.

Yet there is still a drawback: the President cannot wholly trust them. For they may involve him in trouble, and they are behind-the-scenes operators. In that case, what becomes of the Philadelphia Convention's desire to secure an indubi-

table locus of responsibility? The President is still "responsible," but it is a nominal responsibility. His backstairs mentors have not been tracked down and punished, or pilloried before an electorate which may make him or them or his party suffer for misgovernment at the next election. A cabinet on the British and even on the Continental model constitutes the principal part of the executive: there is little in the kitchen (I do not say "nothing"); there are enough advisers to render a "kitchen" unnecessary: the overt cabinet is the group, as a group, to be held to responsibility.

This element of solitary, and not plural, responsibility is the plague spot of the American constitution in the twentieth century. All remedial gadgets must break against its insidious obstinacy. For above all, it destroys from the beginning to the end the possibility of coordinating the work of policy making and administration that has been distributed, and the various work of the agencies and departments and commissions set up by statute. No one man can coordinate so much with so little. Nor can one man, with this unique responsibility, take advantage of the technical and personal devices which from time to time have been proposed and even established to assist him to coordinate the vast proliferation of executive bodies. For we revert always to *his* responsibility, his pride, and his conscience.

Some further observations on this theme are essential, especially in the light of the recommendations made by the Report of the President's (F.D.R.'s) Committee on Administrative Management of 1936, and partly embodied in the Reorganization Act of 1939. As laws have followed laws, the agencies of administration have increased in number. These were not, as they are in normal British and European practice, fitted into as few chief directing departments as possible. By the time the committee reported, over one hundred separate organized departments existed, with the obligation of reporting to the President, and headed by chiefs many of whom drew their authority

<sup>12</sup> It may be known that the present author was for nearly a year at T.V.A. headquarters in Knoxville, Tennessee, during its most critical year 1937-38.

## THE UNITED STATES PRESIDENCY

not from him but from the Congress. Among them were the ten great departments of "the cabinet"; and many commissions, agencies, administrations, and authorities under the President but not within these departments. Some twelve agencies were altogether independent of the President's surveillance. Indeed, the President's Committee on Administrative Management went so far as to say that "a headless fourth branch of the government, responsible to no one," had "planlessly grown." It proposed twelve major executive departments fitted together in one all-comprehensive scheme.

The committee's resounding slogan was, "The President needs help," and it rang true. Accordingly, at the very center of the administrative structure, to assist the President and form a better organized White House staff, the committee proposed six executive assistants to the President in addition to existing secretaries who dealt with the public, with Congress, the press, and the radio. Their only function and status was so defined:

When any matter is presented to the President for action, affecting any part of the administrative work of government, to assist him in obtaining quickly and without delay all pertinent information possessed by any of the Executive Departments, *so as to guide him in making responsible decisions*; and then, when decisions have been made, to assist him in seeing to it that every administrative department is promptly informed. . . . They should be possessed of high competence, great physical vigor, and a passion for anonymity.<sup>13</sup>

One of the principal architects of the Committee as well as of its work (Louis Brownlow, the gifted director of the Public Administration Clearing House of Chicago) explained in its simplest form the purpose of this arrangement:<sup>14</sup>

The President's Committee decided to propose that the Executive Office of the President should perform only those functions, the responsibility for which could not be delegated

by the President. The "non-delegable" functions are those by which an executive may control the policies of his departments, while leaving to the head of each department decisions which are peculiar to its activity and the work incidental thereto. . . . According to our distinction between "delegable" and "non-delegable" functions, a staff function such as purchasing may be centralized or decentralized as expediency may require, but in either case can be well delegated; whereas managerial functions by which an executive can control his organization, especially budgeting, planning and personnel, must be performed in the Executive Office.

They looked to special assistance to the President by the Bureau of the Budget, a planning agency (perhaps the National Resources Planning Board), and a personnel unit.

The Reorganization Act of 1939 implemented much of this central-office reform. Yet still the Presidency did not work; because it *could* not work, even with this assistance. The very minor effectiveness of the reforms could have been and was prophesied. Not that the committee was at fault: without bricks and straw no one can make an administrative heaven. It was hamstringing by the logical defects of the whole system of responsibility within which the President worked. In 1942, I made this judgment on the reforms:<sup>15</sup>

The White House staff was increased as recommended, though time must show whether the physical and psychological attributes proposed for the assistants have been recruited. Experience hitherto, perhaps distorted by World War II, has shown the utility of the staff, but of a kind rather different from that which was planned and expected. A strong president, impatient of administrative apparatus in time of war, and even in time of peace, will hardly wait for his orders to sift down to the departments, or for information to be sifted up to him. He is likely to pass beyond his administrative assistants who are go-betweens, and make direct contact with his cabinet officers (the heads of the great departments) and the mightiest agencies. To him, his assistants would seem to clutter up his path; and to the impatient heads of departments they must appear as obstacles to be circumvented. This is

<sup>15</sup> *Future of Government* (then in mss.), p. 120.

<sup>13</sup> Report, p. 5.

<sup>14</sup> Louis Brownlow, "A General View," *Public Administration Review*, Vol. I, No. 2, pp. 104-5.

## A "SOLITARY" EXECUTIVE

in the order of what has happened; and the president in wartime has dealt with most agencies directly and through political confidential men and old friends.

The committee had its mind consciously focused for the time being on administration. But the President is not merely an administrative manager. He is, in addition—and blended to a point where even theoretical severance is impossible—a legislative leader, and something of the leader of a nation-wide political party. And the severance of administration and policy is only rarely possible. This the committee even affirmed, but it acted as though its affirmation conveyed no command to it.

These predictions have been borne out. They have been attested by many observers. One of the former White House staff has, in a brilliant article, admitted the insufficiency of mere administrative arrangements, and (in my opinion) without intending to do so, has demonstrated the collapse of the single, solitary chief executive for our time. Here is the crux of his constructive criticism:<sup>15</sup>

There remains the need for special facilities designed to capture in each particular matter before the President the best thinking available. Indeed, this fusion of thought by which all the resources at his command are brought to bear upon his business is a foremost function of the Executive Office . . . another unit is required in the Executive Office vested with responsibility for so coordinating the various lines of staff work that every action paper reaching the President becomes a dependable end-product of joint analysis from different angles. . . . Matters placed on the President's desk should adequately reflect not only a government-wide point of view, but also the contribution of different kinds of staff analysis, especially managerial thinking and policy thinking.

All of this has to pile up on the desk of one man! The new device suggested has the purpose of "continuing analysis of the flow of policy recommendations presented for the President's decision." But one man cannot do it! That one man

must always escape to other advice, either outside the apparatus designed or through its network, or himself escape from giving any answer at all. At least some of the answers must be perfunctory and therefore both incompetent as well as irresponsible, while others will not be made by the President at all. When a President is swamped with responsibility he is, paradoxically, tempted to "off-the-cuff" decisions, for how can he genuinely let his duty invade him? The amount of business is beyond one man's capacity or conscience. One solitary man must, surely, look for short cuts. The President needs help, as the Committee on Administrative Management declared; but he needs the help of a dozen or fifteen men, good and true, who bear a direct responsibility *with* him (not *to* him) to the public and the party and the Congress.

Ten years after the reforms mentioned had been put into partial effect, the Hoover Commission, in its Report on General Management of the Executive Branch (February, 1949), returned to the charge as though the committee of 1937 had never had the slightest effect. Indeed, the charges of inefficiency are more serious: "Authority is diffused, lines of authority are confused, staff services are insufficient. Consequently, responsibility and accountability are impaired." (p. 1). And, again, "The line of command and supervision from the President down through his department heads to every employee, and the line of responsibility from each employee of the executive branch up to the President, has been weakened, or actually broken, in many places and in many ways" (p. 4 ff).

The main reforms suggested are three: better integration and dovetailing of the departmental structure, leading to a smaller number of departments; increased Presidential staff services; and more offices of a supervising kind over the functions of government to be lodged in the Executive Office of the President—the latter would be (in addition to the White House Office), the Bureau of the Budget, the Council of Economic Advisers (to be one man, only), the National

<sup>15</sup> Wayne Coy, *American Political Science Review*, December, 1946, p. 1124.

Security Council, the National Security Resources Board, and an Office of Personnel.

What is of supreme interest to the present discussion is the newly suggested Staff Secretary. It is essential to give the proposal in the Commission's own words (pp. 22-23):

At present there is no one place in the President's Office to which the President can look for a current summary of the principal issues with which he may have to deal in the near future; nor is a current summary of the staff work available on problems that have been assigned to his advisers, his staff agencies, or the heads of departments and agencies.

To meet this deficiency, the Commission proposes the addition of the staff secretary. He would not himself be an adviser to the President on any issue of policy, nor would he review (in a supervisory capacity) the substance of any recommendation made to the President by any part of his staff.

The Commission believes that this recommendation will facilitate teamwork among the President's staff, the agencies of the President's Office; and any Cabinet or interdepartmental committees which are studying problems for the President.

If possible the staff secretary, like the executive clerk, should be a career public servant.

The staff secretary should keep the President currently informed of work which has been undertaken by various parts of the President's Office, by the Cabinet committees, or by interdepartmental committees or special advisory committees. He should inform the President of any difficulties which have arisen because of the overlapping of assignments or conflicts of policy. He should make the inventory of interdepartmental committees referred to in [an earlier recommendation] . . .

We need not dwell long on the uselessness of this proposal as a measure of any importance in helping the Presidents to make competent and responsible decisions, whether administrative, or on a higher plane of policy. It wants only the slightest amount of imagination to be spent on the words (in the quoted passage) "current summary", and then the disclaimer that the summarizer would not "himself be an adviser . . . on any issue of policy." Even if he were not, who that was being summarized would believe it,

and not take steps to avert an unfavorable summary? Moreover, how could a single staff secretary even with assistants be big enough to do the job? How could he possibly *not* inject his values into the account given to the President? How could the President not suspect him of such personal interpretations especially if there were complaint made by a department chief?

How could he tell the story of "overlapping" and "conflicts of policy" without really doing the Chief Executive's own work?

The President cannot be helped through a single funnel upwards.

The Presidency needs to be put into commission. It needs distribution among fifteen equals, each of whom is fully the master and the servant of his own portion of responsibility and of all common policy which comes to them as a collective unity. You can coordinate if you have divided; you can divide if you can trust; you can trust if you alone are not saddled with all responsible decision. To apply a famous dictum of de Tocqueville's, used by him to describe the centralization of the *ancien régime* in France: when you centralize in a solitary President, you risk apoplexy at the center and anæmia at the extremities, or a red face and palsied hands. Nor is that all: if no full authority can be granted a departmental chief, how is one to induce men of stature to seek office and stay there?

All these proposed administrative gadgets may well help a little on lesser matters, and even that is to be much applauded. But every gadget calls for another gadget to stop up the still-existing leak, *ad infinitum*. Still, the reservoir of responsibility is so high and heavy that it will flood the channels made for it: what is needed is one collective reservoir and its sharing among a dozen or more interconnected basins, with free circulation among them all. The proposed reforms still leave the President high and dry, for they still leave him responsible for too much.

Nor is this all. The heads of departments are granted authority and are

saddled with responsibility for their department by laws made in Congress. It has been found impossible to stop them from appealing to Congress for the funds and the legislation to implement their departmental policy, whether or not that conflicts with the President's.<sup>17</sup> Close observers admit in desperation that independent staff work for the President (for example, especially through the Bureau of the Budget) may do much to enforce regulations and controls and prepare long-range plans, but *cannot* build up a unified program of policy and legislation.

<sup>17</sup> Hardly a week passes without some such episode as the following. In April, 1948, Secretary of Defense Forrester proposed a program which among other things provided for fifty-five Air Force groups. This, it must be remembered, involves proportionate magnitudes in the other parts of the armed forces; and all together have financial consequences which must be harmonized with the total budget, and therefore with taxation policy, and to some extent, therefore, with general economic policy. The original proposal was presumably made with the agreement of the President, and based on a theory of American commitments in foreign policy. At the hearings before the House Armed Forces Committee, however, Air Secretary W. Stuart Symington pleaded for seventy groups. Congress supported him against the President (presumably) and the Secretary for Defense. At his press conference of April 15, 1948, the President made some non-committal remarks when asked if he would discipline the Air Secretary. The foregoing confusion occurred in spite of the establishment by statute (July 25, 1947) of a Unified National Military Establishment, and of the National Security Council—composed of the President, the Secretary of Defense, the three armed services' secretaries, and the chairman of the National Security Resources Board—to advise the President on national defense. It nicely illustrates the weakness of the Presidency, and the administrative intervention of Congress.

Such cases are repeated as fast as it is possible to print a book. On April 28, 1949, the Secretary of the Navy resigned because the newly appointed Secretary for Defense had forbidden the construction of an aircraft carrier, which had been approved twice by the President, by the Bureau of the Budget, had been included in the budget message of the President on January 3, 1949, and passed by the House on April 18, 1949. The exchange of letters suggests but does not disclose the President's part in all this. See *New York Times*, April 27, 1949, for texts.

It is now newly suggested that a unit in the Executive Office of the President shall convene the appropriate department heads to formulate a common approach. Disagreement would lead to an appeal to the President, with the department heads in session with him. This proposal is an attempt to reproduce a cabinet. But the department heads are men who own no exclusive allegiance to the President: they owe some of it at least to Congress. They are men of the President's party, but the party is not a loyal phalanx. To say they are men of his "party" implies a common policy and loyalty that are far from existing.

Indeed, as one contemplates the collection of incongruous personalities in American cabinets from the beginning, but more especially since the end of the nineteenth century, it is ridiculous to mention the word "party." They are usually appointed because they have or are supposed to have some special interest or expertness in the field of that department—Henry Wallace in Agriculture, and then in Commerce; Jesse Jones in the Reconstruction Finance Corporation; Clinton Anderson in Agriculture; Henry Morgenthau, Jr., in the Treasury (because Mr. Roosevelt had a personal faith in him); Chester Bowles in price administration; Frances Perkins in labor welfare; or Wilson Wyatt as housing administrator, and so on. They are opinionated men; their natural pride is not moderated by party loyalty and solidarity with their chief executive. Their loyalties are divided between the President and their own department; they may sway between the President and Congress; they are torn between their own personal ideas and those of the President. In Mr. Roosevelt's administration of 1933 he had appointed a Director of the Bureau of the Budget, Lew Douglas, who had avowed the policy of a balanced budget and had been attracted by Roosevelt's declarations in favor of this in the campaign of 1932, and at the same time men like Tugwell, Ickes, and such-like, who were enthusiasts for public works which would require deficit financing. In 1935 the Frances Perkins

social security proposals were refuted in Congressional committee by her own colleague, Secretary of the Treasury Morgenthau, who objected, successfully, to the proposed universal coverage. These examples are representative of the many which constitute the history of Presidential administrations.

In November, 1945, President Truman, after a ragged process of consultation with some of his advisers, and after these themselves had never met as one body, set forth his wage-price policy, crucial to all post-war reconstruction—foreign and domestic. Within a few days, a different version was published by his Secretary of Commerce, Henry Wallace. Again, Mr. Truman refused the advice of his Secretary of the Interior, Harold Ickes, on the appointment of an administrator of navy oil lands, and the account given of their relations by the latter shows clearly the non-existence of cabinet discussion and the flight of Presidents to the men they find personally congenial. When the Senate refused to have anything to do with Mr. Pauley, the President's nominee and one of California's Democratic machine leaders, this same man was later appointed by the President to another office—and was very soon obliged to resign office on allegations that he had speculated in grain with inside information. Mr. Ickes' statement on his own resignation (*New York Times*, February 13 and 14, 1946), gives a grim picture of the Presidency.

Crasser examples abound in the foreign policy of the nation. Especially in relation to Russia in September, 1946, the President and Mr. Wallace were able to make matters difficult for Mr. Byrnes, the Secretary of State, while all the staff work in the world did not prevent Mr. Truman from making a *gaffe* on a truly cosmic scale. The story of American policy on Palestine since 1946 is equally calamitous.<sup>18</sup> At times no one knew whether there was a policy at all, or if so, whose it was—the President's, the State Department's, of which rival parties in the State

Department, or of the Senate Foreign Relations Committee. In the end, in November, 1947, the United States stood for partition of Palestine at the United Nations, but did not provide for the armed force necessary to support its view of international justice. After four muddled months in March, 1948, it withdrew its own recommendation—for so incoherent had the process of policy making been that the administration had never counted and accepted the cost. It thereby condemned Palestine to bloodshed. A similar executive-legislative tangle became apparent when the executive, having played a trump card in March, 1948, against the Italian Communists by proposing the return of Trieste to Italy, was set back by Congress' proposal to include Franco Spain in the European Recovery Program!

Another tragic and sickening (Senator Vandenberg called it "cynical") example occurred when Representative Taber, chairman of the House of Representatives Appropriation Committee, on June 8, 1948, led his committee—and with it the House itself—to cut more than one and a half billion dollars from the European Recovery funds, though the policy requiring the amount had been duly embodied in a statute passed by both Houses and signed, with special ceremony, by the President, over a month before. The statute in question, the European Recovery Act, had its origin in a speech made by Secretary of State Marshall in June of 1947. It was followed by negotiations among sixteen European nations for a joint scheme of economic reconstruction, requiring effort and bringing its rewards only after cooperation over a period to the end of 1951. The scheme was fought with the greatest malevolence by the Soviet Union and its satellites. It was a part of a world-wide economic recovery policy, but also a policy of containment of the expanding Russian power. Its promise stabilized France to set herself firmly and successfully against Communist-party aggression and subversion; its imminence fortified the Italian non-Communist government to resist, successfully, the bitter attacks of the Communists and

<sup>18</sup> Cf. Bartley Crum, *Behind the Silken Curtain* (New York, 1947).

affiliated Left Socialists. Congress did not make up its mind until after the Secretary of the Interior and the Secretary of Commerce had produced voluminous and cogent reports to show the effects of America's assistance on America's own welfare, and to demonstrate its capacity to produce and deliver what it had promised. The statute was not passed until after the most careful and lengthy hearings had been undertaken in Senate and House, with testimony submitted to the most searching cross-examination from the State Department, the Department of Commerce, the Department of the Interior, other departments, and after a nation-wide debate of unrelenting intensity.

Finally, after many anxieties and despair that short-sightedness would ruin the hopes of Europe and the world, the program was voted, even then with less of an appropriation than was thought really adequate to the general policy. But the statute *was* voted. On its basis, an American administrator was nominated by the President and consented to by the Senate; his organization, the Economic Cooperation Administration, began to formulate the firm but intricate lines of its policy of supervision and administration of the plan, and the staff was being built up. The European peoples expressed their gratitude, and for their part set up a continuing organization of the fifteen nations, with a secretariat; and their own budgetary, trade, and currency policy became intermeshed with the promised and voted advances.

Mr. Taber and his friends decided, then, that they would not supply the money for a policy which had been voted for overwhelmingly by their own party, under no duress, and commended, after inquiries on personal visits abroad, by their own Congressional colleagues and leaders. Senator Vandenberg pleaded (June 10, 1948) that the House "not make indirect use of the appropriating function to veto these declared policies of Congress, and thus to brand these policies before the world as capricious, unreliable and impotent. We cannot build leadership for peace

upon any such shifting sands." He quarreled, he said, "with the final, overall, meat-axe technique . . . equivalent to a horizontal 20 per cent cut, which in my opinion guts the enterprise. In one fell swoop this takes away something like a billion dollars without a scintilla of regard for all of the carefully screened figures upon which all ECA estimates were made . . ." He observed that the action of the House "keeps the word of promise to the ear but breaks it to the hope."

The incident is full of instruction to the student of American government. The executive's foreign policy meant nothing to Mr. Taber. The Senate's foreign policy of his own party meant nothing to him. The statute containing a policy predicted on a quantity of funds meant nothing. His authority was divorced from the authority to make the policy and offer promised abroad. His authority almost alone could shake the credit of the United States and make infirm the tranquillity of several democracies. He seemed to owe no duty to the Republican leadership. Seniority had won him his place, and egotism moved him to use its power. Senate and House were at odds; their policy committees so laboriously set up by the Legislative Reorganization Act of 1946 (which at the same time raised the salaries and provided expert staffs for Congressmen) were not of timely avail to produce a harmony of policy and expenditure. And all the gadgets manufactured to secure a unity of action of ways and means and appropriations committees, and of executive policy and Congressional will, did not prevent this erratic, capricious behavior, and a profound shock to the whole world (with the exception of the Soviet Union, whose friends began at once to say, "I told you so!"). Was Mr. Taber moved by vanity? Was he affected with a desire to draw attention to himself in an election year? Was he a sincere isolationist? Was he confused? Was he merely spiteful? Is he misanthropic?

The memoirs of Sumner Welles, Raymond Moley, and Cordell Hull combined throw an authentic and tragic light on incoherence and mismanagement of foreign

policy from 1933 to Pearl Harbor. The Pearl Harbor Report reveals a want of alert coherence between White House, the Secretaries of State, War, and Navy, and the Chiefs of Staff, with some proper blame on the first, or, more reasonably, on the system.<sup>19</sup> Other studies throw light on the lack of solidarity at the center—fumbling in the formation of policy, and stumbling and staggering in its fulfillment.<sup>20</sup>

Even with so potent and clever a President as Franklin Delano Roosevelt as compared with the busy cipher, Harry S. Truman, the President needs twelve or fifteen men of his own stature, of equal responsibility with him, equal in accepting party leadership and loyalty. And he and they need the ever-operative assistance of some sixty career men, heading the departments permanently, under the political secretaries—the cream of the crop of an “administrative group” of perhaps 10,000 or 12,000 at all ages on the scale from cadets to mature men and women, to be their advisers, their staff, their arms of administration. All need a Congress organized for, and alert regarding, its function of making collective and unified the policy of the scattered elements of the administration, by everyday, regular, organized, public criticism. Pearl

Harbors, domestic as well as foreign, may be avoided where a collective fifteen are responsible, and where the Congressional five hundred badger them with relentless questions.

On this latter point, an extract from Representative Frank B. Keefe's report on Pearl Harbor is apposite. He says: <sup>21</sup>

Those who find American public opinion responsible for Pearl Harbor accept an entirely false theory. Enlightened public opinion is based on accurate information. The American people, if kept well informed of their real diplomatic position, do not need an incident to unite them. If foreign policy and diplomatic representations are treated as the exclusive, secret information of the President and his advisers, public opinion will not be enlightened. The very nature of the consequent public alarm places the armed forces of the Nation in effective readiness and may even deter an enemy from executing its planned attack.

Without fully accepting the Representative's conclusions—especially regarding the kind of facts that the President can at any stage divulge to the public—or without condoning his motives, it may be ventured that public opinion would have been riper if Congress had had the right to ask questions of the executive. Some one of the five hundred would have been the permanent gadfly of the executive, a gadfly he could never forget, and that would have given alertness and tone to the Secretaries and have compelled a unified not a diversified judgment on their part.

According to Mr. Stimson's *Diary*, President Roosevelt was much exercised, and even baffled, by the problem of awakening the public and yet not alarming it in the two weeks before Pearl Harbor.<sup>22</sup> He considered but postponed a message to Congress. But the problem would have been solved where the executive was under an obligation to appear before Congress regularly.

The lack of a central *thinking*, focusing body of advisers at the top is acknowl-

<sup>19</sup> I cannot subscribe to the narrow-minded fault-finding of the minority report by Homer Ferguson and Owen Brewster, in *Report, Investigation of the Pearl Harbor Attack*, *op. cit.*, pp. 495-573; but they are not without reason in declaring (p. 567):

“The most powerful men next to the President in authority—men bound to obey his orders and serve without stint, were not far from the President's side; and any one of them, if so instructed, could have found and alerted the others. Secretary Hull, Secretary Stimson, Secretary Knox, General Marshall, and Admiral Stark were nearby. They could be reached quickly by means of communication at the President's command.” But—the President and the Secretaries, though fully informed and in frequent contact, were not continuously in collective contact, and their apprehensions were sufficiently diverse in point and intensity to fail to have an inescapable defensive impact on the military and naval arms.”

## THE CONSEQUENCES OF POPULAR ELECTION

edged by observer after observer of the Washington apparatus of government, however reluctant in the beginning they may be to admit any deficiencies in the American constitution.

The evidence of a former assistant Director of the Bureau of the Budget,<sup>23</sup> particularly gifted, confirms the truth demonstrated in every cabinet: how much more competitive than cooperative are the cabinet members among themselves and even in relation to the President. He emphasizes that the departmental heads cannot help the President nor administer their departments adequately through the bureau chiefs. Yet he repudiates the idea of "a rigid, special corps." And he wishes the staff leader at the head of department (apparently picked out of the civil service and put on a special register managed by the Executive Office of the President) to exercise the highest managerial supervision of whole department. Yet he expects this man to be responsible only for "staff cross-reference and synthesis," without a "monopoly on the function of staff representation to the secretary." "Without explicit *authority* to do so, it [the staff-leader arrangement] does it within the limits fixed by an absence of authority." This same observer-participant and political scientist has himself declared that in Washington, *political* sense is lacking, and has endorsed a foreign observer's suggestion that what is lacking is "to think . . . in terms encompassing all of the elements of the scene." This is indeed Washington's cardinal deficiency. But it is a deficiency that *cannot* be repaired by the "chairman" idea, nor by multiple approaches to the departmental head. Not, at any rate, as the first principle of organization. That first principle must be a pyramidal line of authority, from mere clerical secretaries to *one* top, all-surveying, permanent administrator. Authority must first be lodged with him: without that, integration cannot be expected. Then, authority being focussed, indubitable, and plenary, he may exercise it by cross-reference among his

aides, and by chairmanship, and by other tricks of the trade, as do his British counterparts, the permanent undersecretaries. But Appleby has certainly carried the analysis further and more courageously than previous writers—out of the bitterness of experience. Improvement cannot be achieved without a career administrative group, serving for life, if good enough so to serve. This subject is closely linked with the discussion of the top permanent personnel (below, Chap. 33).

### THE CONSEQUENCES OF POPULAR ELECTION

THE President is popularly elected, and owing to the development of the parties and the nominating conventions, he is virtually directly elected. Consequences follow.

In an age where ideologies consciously challenge the very value of law and government, it is a serious weakness that the system of election may lead to a minority President. Wilson won the 1912 election by a minority of votes, and there are other, earlier instances. Such an event might occur at a time of grave distress and excitement. The parliamentary system of producing an executive body will be seen, on reflection, to avoid the grim crudity of unproportional representation to this extreme; or, as in practically all Presidential elections, even the entire repulse from executive influence of a very large minority.

The weight of a whole country behind the President gives him tremendous authority, and makes of him a focus of what millions expect. His popular authority is certainly needed in his relationship with a heterogeneous Congress: his veto and his message-making power would be worth nothing without it. But that popular support can be altogether dissipated by a mind and character not attuned to the opportunities it gives and the qualities it demands. "I felt as though the heavens had fallen down on me!" was Mr. Truman's exclamation on learning that the responsibilities of the Presidency were his. And he certainly acted like a crushed man.

The Presidential campaign comes near-

<sup>23</sup> Cf. Paul Appleby, "Organizing Around the Head of a Large Federal Department," *Public Administration Review*, Summer, 1946.

## THE UNITED STATES PRESIDENCY

est to a unified nationwide consultation on policy. From this standpoint, Congressional and Senatorial elections are marred by excessive localism. The approach to Congress is obstructed by local and sectional barriers; a sum must be added up of diverse and rival elements before a policy can be pieced together. The President is a unit: each time he speaks, at any rate, the policy is one, though, of course, it need not remain so for more than a few days. With popular support, he is expected to unify, and, unifying, is expected to lead. That leadership he is pressed to undertake because a party has selected and made him the one man that best represents them, however badly that may be. He takes charge of the fulfillment of the laws that his party friends in Congress make—that is, one half the business of government. From that half emerges a knowledge of possibilities and necessities which hitherto Congress has not been equipped itself to provide so well as he. Hence, he is in a splendid position for legislative leadership. But more than this: with the development of mass communications (the press always, but in our time especially the radio), the reciprocal influence of Presidency and people has become immense. Perhaps no executive in the world—past times included, and dictatorships not excluded—possessed a status and vehicles of communication so powerful to educate a people in facts and responsibilities, and into mutual support of each other, as the President of the United States. If he fails, it is a personal failure, not one of position or opportunity. By awakening the people, even by his power to do so, he has a steady potential influence over Congress.

Yet is not this customary contrast of the beneficial unity of the executive with the injurious disunity of Congress at least a little exaggerated? The assertion of unity has often been made. For example, Polk's message to Congress at the end of his fruitful and forceful tenure:<sup>24</sup>

<sup>24</sup> J. D. Richardson, *Messages and Papers of the Presidents* (Washington, 1897), Vol. IV, p. 664-65.

The people by the Constitution have commanded the President as much as they have commanded the legislative branch of the Government to execute their will. . . . If it be said that the Representatives in the popular branch of Congress are chosen directly by the people, it is answered, the people elect the President. . . . The President represents in the Executive department the whole people of the United States as each representative of the legislative department represents portions of them.

But is there a real, practical, effective unity of will and policy?<sup>25</sup>

Popular vote for the President has involved the constitution in the weakness of the succession to the President. It is difficult to think of a more unfortunate arrangement than the simultaneous election of a Vice-President. If he is strong, the office is politically dubious, because he is less representative: if he is weak, he has not only not been wanted, but he has deserved not to be wanted. It seems to me that the best solution would be the abolition of the Vice-Presidency, and the return of the succession back to the people. Within a short time after the demise (or the resignation) of a President, say, two

<sup>25</sup> Cf. the more modern, extended, and reasoned statement of a noted student: "That it [the steady aggrandizement of the influence of the executive in determining legislative action] has much to commend it cannot be questioned. Among the things in its favor, first mention should be made of the fact that the chief executive has a representative character in relation to the electorate that is not possessed by the aggregate of members constituting the legislative branch. These members are elected to office by relatively small subdivisions of the country. . . . Rightly or wrongly, it is impossible for them not to give consideration to the manner in which proposed legislative action will affect self-interests and those of their direct constituencies. . . . No such difficulty confronts the chief executive. He is elected by and represents the entire electorate. He, moreover, is, with rare exception, the acknowledged leader of the dominant political party and has been entrusted by it with the responsibility of using its best efforts to secure the translation into an action of the pledges made by his party. Strategically, he thus occupies a strong position. He represents the entire country in a way that the individual members of the legislature do not, and cannot. . . ." W. F. Willoughby, *Principles of Legislative Organization and Administration* (Washington, 1934).

or three months, there ought to be an election for President, to hold office for the full term. In the interim, several "caretaker" devices are possible: the speaker of the lower house; or the ranking member there of the President's party; or the Secretary of State. For a people to choose almost by accident, certainly by an involved compromise, and practically in ignorance, a Vice-President who may well become President, has been clearly shown to be an extremely costly business for the nation, and (it cannot be ignored) for other nations also. It has happened seven times. The story of Mr. Truman's nomination, and the unworthiness of the motives producing it, are awful warnings, deserving notice.<sup>26</sup>

Like the British prime minister, a President gives hostages as he moves along toward the supreme position. But the prime minister gives his hostages to his party colleagues: the concessions he makes to them in policy and in promises of place, are confined by the fact that party allegiance is strong. He cannot be capricious. There is method in the madness. The American President has not usually risen alongside the party chiefs: he has often risen in open hostility to them. The party is assisted by all sorts of "outsiders" among the henchmen of the local bosses, and powerful men not thoroughly saturated with party loyalty. Hence the extraordinary caravan of miscellaneous entrants into the administration at home and abroad. They may never have met before in their lives. At most they may have the merest passing acquaintance. They may hate each other as the result of incitement in casual press rumors. They drift to-

gether from the most incongruous careers with the most inharmonious outlooks. Thus, Daugherty appointed by Harding; Ray Lyman Wilbur by Hoover; Mr. Woodin by Franklin D. Roosevelt; Messrs. McAdoo and Mellon by Wilson; (Mr. Hoover himself as Secretary of Commerce); Mr. Pauley and Mr. Snyder and Mr. George Allen by President Truman; several in the Franklin D. Roosevelt "Brain Trust" soon to be dispersed and discarded; Jesse Jones as head of the RFC. by Franklin D. Roosevelt; Colonel House and Robert Lansing by Woodrow Wilson; the egregious George Harvey and later Joseph P. Kennedy in the London Embassy; the too-clever "Boss" Flynn in Canberra—almost. Hence, also, the incoherence of Presidential policy, and the frequent public brawls between two or more of the President's departmental chiefs, and sometimes between himself and one or more of the participants. Thus Milo Perkins and Henry Wallace; Henry Wallace and Jesse Jones; Leon Henderson and William Knutson; Donald Nelson and William Knutson; Sidney Hillman and William Knutson; President Roosevelt and General Johnson, and also Raymond Moley; Cordell Hull and Sumner Welles; Harold Ickes and (the proposed) Edwin Pauley and the President, in which Mr. Ickes ventured to doubt the word of President Truman in public, and even to suggest that a President may be at least terminologically inaccurate.

No limit seems to be irrefragably placed on the number of terms the Presidency may be held by one man. Until Franklin D. Roosevelt's time, it seemed to be taken for granted that two terms was a not improper rule. None had even tried for a third. Whatever the motivation of Roosevelt in flying in the face of tradition, a strong case could be made for his action on the ground that the European war required that his eight years' experience be continued. He himself urged this. It is interesting to observe that a forceful argument against this was the burden of the office on the health not only of Roosevelt but of any man at the age when he is likely to become President. A fourth term fol-

<sup>26</sup> Cf. E. J. Flynn, *You're the Boss* (New York, 1947), p. 180 ff. For a review of the problem of the Presidential succession, and legislative proposals regarding it, see R. S. Rankin, "Presidential Succession in the United States," *Journal of Politics*, February, 1946, and E. S. Brown and R. C. Silva, "Presidential Succession and Inability," *Journal of Politics*, February, 1949; and for the election figures and situations, A. M. C. Ewing, *Presidential Elections: Lincoln to F. D. Roosevelt* (Oklahoma, 1940), and C. A. Berdahl, "Presidential Selection and Democratic Government," *Journal of Politics*, February, 1949.

## THE UNITED STATES PRESIDENCY

lowed, victorious against the Republican argument that a Democratic President had better not be elected, because if a Republican Congress were, that President would be stultified! After this experience, there is more psychological freedom for at any rate three terms. The constitution itself leaves the door wide open to the needs of the nation, intentionally, according to the Records of the Convention.

The Republican Congress voted<sup>27</sup> a proposed constitutional amendment in 1947 to the effect that

No person shall be elected to the office of the President more than twice, and no person who has held the office of President, or acted as President for more than two years of a term to which some other person was elected President shall be elected to the office of President more than once. . . .

All the more reason for redoubled efforts to improve the quality of the political parties, and seriously to reconsider the central stipulations and conventions of Presidential government.

### MORE THAN AN EXECUTIVE

THE constitution intended that the executive should be more than a mere executive: it very considerably modified the pure idea of the separation of powers. He has become a very active legislative leader<sup>28</sup> as well as an executive.

On the executive side, attention need be drawn only briefly to his remarkable powers of appointment and dismissal of officials, high and low, and his power to conduct foreign affairs.

*Appointment and Dismissal of Officials.* To safeguard its interest in the execution

<sup>27</sup> February 6, 1947, House of Representatives, 285 to 121; amended by the Senate, March 12, 1947, 57 ayes, 23 noes. On March 21, 1947, there were 81 ayes, 29 noes! in the House of Representatives. By January, 1949, 22 state legislatures had ratified, two had rejected, it.

See Everett S. Brown, "The Term of Office of the President," in *American Political Science Review*, June, 1947. See for the problem of the Presidential succession, Joseph E. Kallenbach, "The New Presidential Succession Act," *ibid.*, October, 1947.

<sup>28</sup> Cf. p. 686 below.

of some administrative functions, Congress has attached restrictive rules to some dismissals: thus for members of the tariff commission, where Congress has deemed the agency to be quasi-legislative. The *Humphrey* case (1935) decided that. But where the office is administrative (and that is a matter of judgment by the Supreme Court, if an issue is taken to it), then the President, particularly because he is responsible for the faithful execution of the laws, cannot be restricted in his power to discipline by removal. Even the Tenure of Office Act of 1867, deliberately passed to thwart President Johnson, and designed to secure the administrative supremacy of the Senate, fell before the necessities of unified and directed administration. The *Myers* case (1926) reaffirmed the Presidential power. This does not invalidate rules designed to secure fairness to the official, or the efficiency of the service. A more interesting test came in 1938, after Roosevelt had removed Morgan, chairman of the TVA and the latter sued for salary. The Courts took the view that the TVA was an "administrative" agency subject to the necessary disciplinary power of the chief executive. This, although the statute and the debates leading to its passage had fostered the principle that the TVA was to have some independence and be clothed with the flexibility of private enterprise.<sup>29</sup> Yet it was a proper decision. It is a tremendous responsibility therefore that inheres in the President.

*Conduct of Foreign Affairs.* As for the conduct of foreign affairs, the President is limited by the knowledge that he had better conform to some general estimate of the mind of two thirds of the Senate, lest he suffer repudiation, as Wilson was repudiated by that body over the Treaty of Versailles and membership in the League of Nations. But within that very wide limit, the President is most potent in his diplomatic powers. He may make important agreements not by treaty but by "executive agreement!" Their range has been extremely wide: the limitation of

<sup>29</sup> Cf. Herman Pritchett, *TVA* (Chapel Hill, 1943). Chap. 7.

naval forces on the Great Lakes (1817); the agreements with various nations on the "Open Door" in China (1899 and 1900); the ending of the Boxer Rebellion (1901); the limitation of Japanese immigration into the United States (1907); the recognition of special Japanese rights in China (1917); the exchange of destroyers for bases with Britain in 1940. And so on. The courts uphold such agreements.<sup>30</sup>

In addition to this, the President has the power, as commander-in-chief, to order the movement of United States troops and navy, a power used scores of times<sup>31</sup> where his ideas of the interests of the United States in various parts of the world have required a show or the use of force. Consider the effect of Mr. Roosevelt's sending of troops to Iceland before America entered World War II, and the order to the Navy to shoot at German craft molesting American vessels.

At least as important is the everyday power to take the initiative and make declarations to the nation and the world. For example, the protracted relations with Japan, culminating in Pearl Harbor—negotiations designed to reduce Japanese power and pretensions, and to "baby them along" until American opinion and arms were strong enough to resist injustice more forcefully. Or the Rooseveltian negotiations with Hitler in 1937 and 1938, and the withdrawal of the American ambassador from Berlin in 1938. Once again, the abrupt thoughtless action (not taken in cabinet, but in colloquy with one adviser!) of Mr. Truman in cutting off Lend-Lease from Britain in 1945; and his personal difficulties in understanding the importance of not allowing a public statement on Russia on one basis by his Secretary of Commerce while his Secretary of State was negotiating with the Russians on a different basis, and the effect of this on the stability of other nations.

The importance of the Presidential dip-

lomatic power lies in its enormous scope and its value for the interests of the United States and the rest of the world. It happens that the United States is the most powerful nation in the world, by reason of her population, her level of education and culture, and her economic and military power. What a commanding instrument to wield in world affairs! The whole world's balance depends upon American clarity and firmness. Unfortunately, the constitution is not such as to assure peace to other nations, ally or enemy. For the source of diplomacy is so broken, confused, and obscured that other nations are unable to obtain an assurance of constancy and definition. The President may say one thing; his Secretary may say another; other members of his administration may speak altogether differently in public; and even if they say the same thing, which is a matter of guesswork to diplomats abroad, Senatorial sentiment must be considered. For a vigorous dissent by the Senate will arouse opposition in the nation, sufficient perhaps to wreck the policy, certainly to make the rest of the world uncertain how *effective* Presidential declarations are. Clarity more than charity is the duty owed by the United States to the rest of the world, whatever the policy. Mr. Stimson supported the League in its dealings (sometimes) with Japan over Manchuria with approval and assurances in 1931: but all foreign diplomats knew that this was a futile form of support.<sup>32</sup> They ignored it in practice because it was not a commitment. Perhaps the advent of the Security Council and the General Assembly of the United Nations will compel clarity, by compelling a bipartisan policy, and above all, after the Palestinian fiasco and reversal, by teaching that policy must be calculated many moves ahead. If that occurs, the Presidential initiative will still exist, as well as all the other instrumentalities of his constitutional authority, but it will be exercised in commission rather than individually. Significantly, it will be-

<sup>30</sup> Cf. E. M. Borchard, "Executive Agreements," *American Political Science Review*, October, 1946.

<sup>31</sup> Cf. Grafton Rogers, *World Policing* (published by World Peace Foundation, New York, 1945).

<sup>32</sup> Cf. B. W. Wallace "How the U.S.A. Led the League in 1931," *American Political Science Review*, February, 1945.

gin with party discussion and interparty agreements.

The considerable part of the executive in initiating the making of law has already been described.<sup>33</sup> It is very significant but ill-organized, chiefly because Congress does not recognize it, except grudgingly, and as an encroachment on its own powers. The President occupies a curious position as legislative leader. He is not quite the leader of his party, which can mean only the score of chieftains who are in and out of Washington from their local fastnesses of bossdom, or from the citadels of big business or big labor.<sup>34</sup> In the one serious attempt by the President (small as that attempt was) to secure for himself a party following by intervention in the primaries, his failure reinforces the validity of the advice offered him by his national chairman, Jim Farley, and reinforces the knowledge we have that the party is a more or less fortuitous gathering of local chiefs. Farley advised Franklin Roosevelt: <sup>35</sup>

... the job of the Democratic National Committee is to work for and assist in every way possible in the election of the party candidates. It denies to no man the right to aspire to office and it has absolutely no concern with, or in, the primary or convention struggles for these nominations. As individuals, the members of the National Committee may have their favorites, but as a body, the organization's hands are off and will continue to be off. These nominations are entirely the affair of the States or Congressional districts, and however these early battles may result, the National Committee will be behind the candidate that the people themselves choose. This goes for every state and every Congressional district.

The President deleted the last two sentences, Mr. Farley reports.

The platform is not drafted with his assistance and for his engagement, unless

he happens to be in office at the time of preparation for the coming campaign. He is under no obligation to take notice of its promises; and conveniently, they are not usually so hard and fast that deviation from them is either technically difficult, verbally discernible, or stirring to the conscience. And yet—he can hurt his Congressional friends by slack execution; he can help them by the loan of his experts; he can destroy their efforts by the use of the veto; and he feels some responsibility to the fortunes of that vague entity called “the Party.”

In times of emergency, like a bad depression or after a war, he could be a creative leader. He has resources of *expertise*, and freedom from the tyranny of localism—a high and central view that can contribute potently to helping men and women all over the nation to understand and accept a policy that is different from the policies of the several sections, the states, and the parties in conflict! He may take longer views than any of these; and provide against the consequences to all that will be the result of complete and uncompromising bargainers' insistence on their own full claims, or successful log-rolling by the groups at the moment most strategic for enforcement of their predatory will.

Such a contribution was made, in a degree unprecedented since Lincoln, by Franklin D. Roosevelt. His immediate successor seems not to have had his inspiration of objectives, his flair of method, his talent to seek, find, and keep counsel, his genius of maneuver, and his fortitude to withstand immediate rebuffs for long-term and nation-wide values. Let the legislation of Theodore Roosevelt, and of Woodrow Wilson, and of the New Deal era, be recalled, that is, the most important in economic and social significance: the initiator was the President and a few personal and Congressional friends. Consider the vetoes, also, of Theodore Roosevelt regarding water power; Hoover on the TVA; and F.D.R. on tax legislation, on the soldier's vote, on bills establishing price-ceilings, on the CCC (and the food-subsidy program), among many others.

<sup>33</sup> Cf. p. 442 above.

<sup>34</sup> James A. Farley, *Jim Farley's Story: The Roosevelt Years* (New York, 1948), pp. 120-21.

<sup>35</sup> For example, Mr. Truman at the Jackson Day address, March 23, 1946: “My friends in Congress have got to make up their minds whether they are for the veterans' rights or whether they are going to bow to the real estate lobby.”

Then it can be appreciated how powerful a President possessing mind and moral strength plus one third support in Congress may be to influence policy, directly by quashing a law, or indirectly, by letting his views be known beforehand, so warning Congress off certain behavior unless it is sure of a majority originally and later of a two-thirds vote to override him. By his veto power, a lashing last word in a public argument, the President is a permanent participant in Congressional calculations. For all this legislative leadership the President certainly needs help, abundant help, but a different kind of help from the gadgets so far used or proposed. For they do not deal drastically enough with the obstructions of the power to provide for the nation's needs, as evidenced by pains and stresses that can be removed from society at the cost to only a few people of some trivial and unjustified privileges.

Though these criticisms must not be ignored, it can be happily acknowledged that advisers around the Presidents have rendered them and the United States signal service in inventing and operating a number of auxiliary staff organizations without which the Presidents would be lost indeed. This development may be said to have properly begun with President Taft's Commission on Economy and Efficiency. A very brief indication of the character of these services must be given.

*The Executive Office.* They consist, first, of the Executive Office of the President: that is, of the Bureau of the Budget, the Liaison Office for Personnel Management, an Office of Emergency Management, the White House Office already discussed,<sup>36</sup> and the Council of Economic Advisers. The Executive Office was established by the Reorganization Act of 1939, and the scope of authority of the various units is defined in various statutes and executive and administrative orders. The Bureau of the Budget was first instituted by the Budget and Accounting Act of 1921, and has since undergone valuable transformations. The Liaison Office for

Personnel Management is all that remains of the recommendation of the President's Committee on Administrative Management that the three-man Civil Service Commission should be transfigured into a single Civil Service Administrator to be the President's adviser and manager of all personnel affairs throughout the civil service. The recommendation was rejected by Congress from fear of excessive power in the executive, and by suspicion that the service might be opened to spoils. Instead, the Liaison Office is a rather attenuated, untethered link between the President and the Civil Service Commission. The Office of Emergency Management exists only on paper in the form of two administrative orders of 1940 and 1941. For its purpose—to provide an organization to cope with national emergencies, such as domestic disasters of flood, earthquake, drought, and so on—was overwhelmed by the emergencies of World War II. It operated, therefore, only in wartime, when it devised the governmental procedures and machinery for the preparation and conduct of the war. When the Office of War Mobilization was established in May, 1943, the liaison activities of the Office of Emergency Management came to an end—but not the office.

Two units of the Executive Office remain for discussion, the Bureau of the Budget and the Council of Economic Advisers.

*The Bureau of the Budget.* The role of the Bureau of the Budget in the preparation of the fiscal legislation of the government has already been described.<sup>37</sup> Emphasis was placed upon the influence of the bureau in producing something like a rational harmony among the competing claims for expenditure, and therefore of the policies of which expenditure is a monetary index. The budget-making power is a mighty arm for the integration of administration and policy, and its establishment by the Act of 1921 added much strength to the Presidential office. It was, however, observed that the Bureau, whose director is appointed solely by the

<sup>36</sup> Cf. above p. 674.

<sup>37</sup> See above, p. 520.

President, can exert its authority on behalf of the President, only if the President disciplines the departmental chiefs—and this he is not in a position to do, comparably with the British prime minister, though vastly more able than the French prime minister. In the Bureau of the Budget, a lively, elevated, and constructive President has a splendid instrument for progress, welfare, and good sense, in national policy and administrative cohesion and tempo. Yet this is not proof altogether against the disruptions of Congress when the Budget passes through its deciding hands, nor against the surreptitious appeals of department chiefs to Congressional friends for support against the chief executive's "decisions."

Down to 1933, the Bureau of the Budget restricted its activities almost exclusively to those mentioned. From that time, and later under the impulse of recommendations from the authors of the Report of the President's Committee on Administrative Management, it became a more comprehensive engine of Presidential control, especially under the direction of Harold Smith.<sup>38</sup> It increased its staff greatly, and recruited the specific talents appropriate to its various functions. As prescribed in Executive Order, September 8, 1939, it undertook

To supervise and control the administration of the budget.

To conduct research in the development of improved plans of administrative management, and to advise the executive departments and agencies of the Government with respect to improved administrative organization and practice.

To aid the President to bring about more efficient and economical conduct of Government service.

To assist the President by clearing and coordinating departmental advice on proposed legislation and by making recommendations as to Presidential action on legislative enactments, in accordance with past practice.

To assist in the consideration and clearance

and, where necessary, in the preparation of proposed Executive orders and proclamations, in accordance with the provisions of Executive Order No. 7298 of February 18, 1936.

To plan and promote the improvement, development, and coordination of Federal and other statistical services.

To keep the President informed of the progress of activities by agencies of the Government with respect to work proposed, work actually initiated, and work completed, together with the relative timing of work between the several agencies of the Government; all to the end that the work programs of the several agencies of the Executive Branch of the Government may be coordinated and that the monies appropriated by the Congress may be expended in the most economical manner possible with the least possible overlapping and duplication of effort.

It was not quite foreseen that the Bureau of the Budget would emerge as the outstanding weapon of the President in the armory of several advised between 1933 and 1937. Some as we saw, fell by the wayside. Another, the Office of Government Reports, was stillborn. But the Bureau of the Budget has thrived and has given valuable hints to other governments how to establish efficiency—at the second level.

*The National Resources Planning Board.* The Council of Economic Advisers is, in some sense, the successor to the National Resources Planning Board, and some attention must first be given to the latter. The Board was conceived by the Report of the President's Committee on Administrative Management as one of the three instruments by which a single-man Presidency could secure some control over the gigantic apparatus of government: the fiscal element was to be taken care of by the Bureau of the Budget, the personnel element by the Civil Service Administrator, and governmental planning by the National Resources Planning Board. The Board succeeded the National Resources Planning Committee established in 1935 by an executive order of the President. Its work was directed by gifted political scientists, economists, and administrative experts, and its researches and day-by-day functions were conducted by a well-quali-

<sup>38</sup> Cf. especially F. Morstein-Marx, "The Bureau of the Budget," *American Political Science Review*, 1945, pp. 653 and 859 ff.; and Harold Smith, *The Management of Your Government* (New York, 1946).

fied staff, partly part-time. It produced a series of remarkable reports, looking into the future of American natural and human resources, the variety of governmental units and their aptness to the social reforms of the future, and, most urgent of all, the remedies for economic depressions. Also, by preparing reports and lending experts, it fostered regional and local planning conferences. Some of its directors also gave direct personal advice to the President at his request. It was another form of "brains trust," more institutionalized, more academic, more remote from the invention of immediate policy, and especially concerned with foresight beyond the range of instant necessities, with themes fundamental to the problems of the day but still below the political surface.

The Executive Order of September, 1939 gave it an even ampler scope, not unnaturally, since one of the authors of the Report was the leading spirit in the National Resources Committee. That Report proposed:<sup>39</sup>

This Board should serve rather as a general staff gathering and analyzing relevant facts, observing the interrelation and administration of broad policies, proposing from time to time lines of national procedure in the husbanding of our national resources, based upon thorough inquiry and mature consideration; constantly preparing and presenting to the Executive its findings, interpretations, conclusions, and recommendations for such final disposition as those entrusted with governmental responsibility may deem appropriate.

It was to be only, and never was more than, a plan-making, not a plan-ordaining or plan-executing, body. It recommended, but made no decisions. For it was recognized that decision lay with the executive and finally with Congress. It was, that is to say, a "thought-organization," not a "will-organization." It would be useful, declared its framers, only "in proportion as it is detached from immediate power and responsibility."

Accordingly, the Executive Order established the Board. Its functions were defined as follows:

(a) To survey, collect data on, and analyze problems pertaining to national resources, both natural and human, and to recommend to the President and the Congress long-time plans and programs for the wise use and fullest development of such resources.

(b) To consult with Federal, regional, State, local, and private agencies in developing orderly programs of public works and to list for the President and the Congress all proposed public works in the order of their relative importance with respect to (1) the greatest good to the greatest number of people, (2) the emergency necessities of the Nation, and (3) the social, economic, and cultural advancement of the people of the United States.

(c) To inform the President of the general trend of economic conditions and to recommend measures leading to their improvement or stabilization.

(d) To act as a clearing house and means of coordination for planning activities, linking together various levels and fields of planning.

The Board functioned to the middle of 1943, when Congress abolished it. Congress felt so hostile to it that it provided that its functions should not be transferred to any other agency, nor performed after the date of termination. For the Board had produced some remarkable reports on the state of the national economy. Even apart from their remedial recommendations, the mere record of the facts disturbed the conscience of the legislators. It acted as a reproach to the hard of heart; it indirectly accused them of not doing their duty. President Roosevelt made some parts of the reports into the ingredients of his messages and recommendations to Congress—especially so regarding antidepression measures, and the combating of want, disease, unemployment, and lack of education. The new "bill of rights" proclaimed in the message of January, 1943, comes from the Board's reports, and especially from its leading spirit, Professor Charles E. Merriam.

*The Council of Economic Advisers.* It is easier to abolish a governmental agency than to abolish the obstinate need for the

<sup>39</sup> President's Committee on Administrative Management, *Report with Special Studies*, (U.S. Government Printing Office, 1937), p. 29.

functions it serves. In 1946 Congress was compelled by the sentiments of economic improvement nurtured by experience of a war and the economic and social ideas clarified by argument during it, to set up the Council of Economic Advisers to the President. (Indeed, some politicians had proposed a committee of cabinet members to work with an advisory council.) The general political purpose was to use government to provide "full employment" and to attain higher standards of living. Congressional opposition, however, succeeded in qualifying this clear objective to read: <sup>40</sup>

creating and maintaining, in a manner calculated to foster and promote free competitive enterprise and the general welfare, conditions under which there will be afforded useful employment opportunities, including self-employment, for those able, willing, and seeking to work, and to promote maximum employment, production and purchasing power.

All the agencies of government would be utilized and coordinated for this purpose, as a continuing policy and responsibility. To enable the President to play his part, a Council of (three) Economic Advisers was established by the statute, in the Executive Office of the President.<sup>41</sup> To enable Congress to play its coordinate part, Congress established its own Joint Committee on the Economic Report of the President. At the beginning of each regular session of Congress, the President transmits to Congress an economic report setting forth an account of current conditions of employment, production, purchasing power, and the trends of these factors, together with a review of the federal government's economic program, and the relationship of all these matters to the responsibilities for economic prosperity imposed on the government by the statute. It is the Joint Committee's business to report to the Congress its "findings and recommendations with respect

to each of the main recommendations made by the President in the Economic Report."

Actually, the Council of Economic Advisers have thought it wise to make a midyear report also. The economic report is the President's. It is not the exclusive production of the Council of Economic Advisers—headed by the economist Professor E. G. Nourse—but is the product of their findings, and of the assistance and advice of his cabinet and of the various departments. The Council consults with a number of advisory committees in which business, labor, agriculture, consumers, state and local governments, and educational and research institutions participate.

Perusal of the Reports show indubitably that they are the Council's work. It is difficult to divine what the Council can possibly mean when they say, "The ultimate judgments entering into the Economic Reports to the Congress rest with the President."<sup>42</sup> The solitary man does not know a thing about the subject! All they can mean is that he has accepted the advice of others, and assumes responsibility for the analysis, and above all, for recommendations for action.

The Council of Economic Advisers differs from the National Resources Planning Board in keeping strictly to an advisory-analytical role, and not attempting to plan public works or conservation developments, and so on. It is most careful to keep itself from proposals of policy; and though this is difficult to do given its object and scope, it is possible, and the Reports show that it is done.<sup>43</sup> So far has its first chairman accepted the need to remain apolitical, that he has expressed very emphatically the view that the councillors should not appear before Congressional committees to express views on legislation which is pending. For this might entail them in a tangle before the Con-

<sup>40</sup> Full Employment Act, February 20, 1946, section 2.

<sup>41</sup> See a very interesting article by E. G. Nourse and B. M. Gross, "The President's Council of Economic Advisors," in *American Political Science Review*, April, 1948.

<sup>42</sup> *Economic Reports of the President* (New York, Reynal and Hitchcock, 1948) p. ix.

<sup>43</sup> *Ibid.*, p. 14. Cf. also E. G. Nourse, "Economics in the Public Service," *Proceedings American Economic Association*, in *American Economic Review*, Vol. 37, 1947.

gress in advocating or disagreeing with the policy the President has decided to follow. Yet the other two members feel that they ought to extend assistance to the Congressional Joint Committee when it is considering the material contained in the Economic Reports.

Although the Council is advisory, through its close cooperation with the Bureau of the Budget—which is the repository of so much knowledge about every department of the government, and which values the economic analysis provided by the Council for its own budgetary purposes—it becomes of some influence in drawing the departments together.

The President even has the Council appear at a cabinet meeting each quarter to present for discussion a survey of economic developments and problems! Yet the student must still remain a little skeptical when he reads, after less than two years of operation, that "The result of the Council's participation in cabinet meetings has been to help bring the thinking of department heads to a more unified consideration of the central economic problems faced by the President." "The Hoover Commission rightly proposed that the Council give way to a single economic adviser.

With this apparatus available, no excuse can be offered for failure by the President or Congress to take the best measures that economic science can suggest for assuring economic prosperity so far as government can assist this. Whether the advice is taken, however, depends once again on the political considerations which induce men to act or neglect to act—that is, on the balance of group wills in the community—and the judging of these is the President's business. And here, precisely, the President is still without the real assistance he needs as a creator of policy—equal colleagues equally sharing responsibility for a common end of which all are conscious and to which all are loyal.

*Interdepartmental Coordination. Vari-*

ous interdepartmental arrangements have existed or exist for administration to achieve certain comprehensive goals. For example, the Office of Economic Stabilization during World War II acted to govern the national economy from the standpoint of prices; and, in order to do so, the Director, appointed by the President, had the widest conceivable authority, with the approval of the President, to issue directives of policy to all the Federal departments and agencies concerned. Similarly, the Office and Director of War Mobilization, from the standpoint of maximum production. Similarly, again, with immense powers, laid down as in the previous instances by Congress, the Office and Director of War Mobilization and Conversion, for the orderly return to a peace economy.

In the bill of July 26, 1947, organizing the three armed forces under a Secretary of Defense and setting up a combined National Military Establishment, a National Security Council was established. It is composed of the President, the Secretary of State, the Secretary of Defense, the Secretaries of the three armed service departments, and the chairman of the National Security Resources Board. Its function is to advise the President on national defense. It is highly reminiscent of the Defense Committee of the British cabinet. (The reasoning behind it may be read in Senate Committee print, Committee on Naval Affairs, 79th Congress, 1st Session, 1945, "Unification of War and Navy Departments and the Postwar Organization for National Security.")

Finally, the President is assisted from time to time by the reports of special commissions of inquiry, appointed by himself. Examples are the President's Commission on Higher Education (July, 1946); another (under his authority as commander-in-chief) the Scientific Research Board (October, 1946); or, again, the President's Advisory Commission on Universal Military Training (December, 1946).

When all this is said, what does this far-reaching Presidential auxiliary apparatus amount to? Almost certainly, many

<sup>44</sup> Nourse and Gross, *op. cit.*, p. 290.

minor matters of interdepartmental administration are solved on interdepartmental lines, but these mainly rank below the really important political sphere. They are not by any means decided by a steady, rational supradepartmental common mind. And, above all, the President knows practically nothing about them and decides even less.

I can properly assert, on the basis of full first-hand evidence of perhaps two score top participants at or around the assistant-secretary level in Washington, that their attempts at policy coordination condemn them, whether or not it finally succeeds or triumphs at the very top level, to nerve-wracking, tormenting negotiations, started, carried on, broken off, restarted, achieved with compromise. When the process is finally abortive, there is sickness at heart, discouragement and dependency, cynicism, and nervous breakdowns. For these officials will admit, they do not work, as their British official counterparts work, within the broad, fairly firm framework of a policy made by a political party ruling the whole process of government, or, where the party has not yet made up its mind, the prior existence of a party ethos always pregnant with a policy. There, the officials are effective within a circle forescribed, but it is not an absolute circle—they may help to create it. When they have done their share of the work, the pail will not be kicked over and the milk spilled. As one tortured Washington official declared: "Our British colleagues live in the paradise of the bureaucrat!"; and he meant only that their work, when done, is not destroyed. For there is imposed on the top administrative officials in Washington, a task of weaving together policies that are the proper responsibility of the political party and the responsible executive. This should not be asked of them, and the system needs refashioning in order that what belongs to party and President should be done by party and President. To ask it of the administrative chiefs is to ask for complete or partial failure and the wreckage of health.

The brains, the character, the energy,

the impetus—all are there, but they are not geared to central inspiration. There is no concert. One man has not the capacity, though he bears the responsibility, to produce a concert. In spite of all the apparatus of advice and coordination, the President swings about untethered to the whole administrative machine—he is a stranger to it.

If the gravamen of the Hoover Reports on "The National Security Organization" and "Foreign Affairs" be identified, it consists in this feeling that the President is removed from immediate immersion in the stream of affairs and that his advisers are separated from him by the responsibilities and authority with which Congress has invested them, while the President has his own kind of responsibility. The National Security Board and the National Security Resources Board (responsible for advising on the total mobilization of all the resources and manpower of America in the event of war) are not truly his instruments, though they are necessary aids to the fulfilment of his own responsibilities. Similarly with the conduct of foreign affairs: numerous agencies own a segment of relations with foreign powers, and these often are intermeshed with their duties to domestic American life. Foreign affairs, defense measures, the economy, ought all to come under a coherent regular responsible survey by a body which has a collective responsibility. But, now, interposed between the President and some of the department chiefs, stand the interdepartmental committees mentioned and various others, while at the center stands a solitary man, hardly other than a stranger to the various chieftains who come "to brief" him, irrelevant and bewildered.

The idea of the Hoover Commission that the Executive Office would have several advisers and coordinators of large segments of government business—the economy, the budget, defense, resources planning—would seem to offer to the President a kind of new super-cabinet: this could be so, and work well, if these men saw eye to eye politically, and if, with the President, they personally felt

## THE EXECUTIVE SEPARATED FROM CONGRESS

a corporate responsibility, and if, moreover, their relationship of authority to the heads of departments were satisfactorily settled. The Hoover Commission's idea that rather than these statutory interdepartmental committees, the cabinet should spawn cabinet committees as and when it thought proper is sound: they should stem from the center of responsibility, that is to say, from the President and his cabinet, and not invade the center by advancing from the outside fortified with Congressional authority, fixed in its terms of responsibility, and divided in loyalty, inflamed with conceit. The assumption is, however, that a real "cabinet" exists—but it does not. The two reports mentioned above are permeated with the embarrassment of recognizing sole Presidential responsibility in the last, that is, the controlling resort, and the difficulty of devising a way whereby the aid given by their chosen instruments could be really made to impinge on the President's mind. I incline to the belief that "ne'er the twain shall meet," or, if so, then only by the accidents of personality.

### THE EXECUTIVE SEPARATED FROM CONGRESS

WE always return to the root of the trouble. Legislature and executive have been severed, though not completely. The executive has even been banished from the floor of Congress in open responsible appearance, though its presence is required, perhaps excessively, in committee hearings and investigations.

Congress makes the laws and Congress furnishes the funds. This at once nourishes its corporate pride and its alienation from the executive. Each is invested with its own responsibilities: it is obliged to think of those first, always possibly above considerations of good government. For it was originally believed that government could be good only when these psychological occlusions were established.

It has already been borne in on the reader how enormously wasteful a system it is that severs executive knowledge from Congressional lawmaking, and executive

administration of the laws from the direct everyday impact of those who have made them; and that separates the making of policy from its fulfillment. This is the normal predicament, even where a President and his party are well in the saddle in both Houses. But even then tremors occur—and general faults of time table, priority, and emphasis—because some men in the party, who themselves might have been high in the leadership, dislike the President. They become uncooperative: sour, conceited, obstructive; responsibility is obscured, and what should be done is neglected. How much more so does this mutual stultification, but chiefly that of the President, weigh upon the nation, when, as too often happens, the party cannot simultaneously dominate legislature and executive! Each then steers a course towards a full victory over the other at the approaching elections: neither is willing to assist the other wholeheartedly, though each may make pretense of this as an election tactic.

At the best of times, the executive arrangements for the due order of business are spoiled by the private and more or less surreptitious appeals of department heads and subordinates to Congress for laws and money and administrative permissions. This contravenes the rules of the Budget and Accounting Act of 1921, and flies in the face of the repeated orders of the presidents. Congress, not President Roosevelt, settled the dispute between his Secretary of Commerce Wallace and Jesse Jones, his Federal Loan Administrator, whatever the President's wishes in the matter.

The President's persuasion of Congress is undertaken through most tenuous processes and ramshackle contrivances which continually face breakdown. Leadership is always at long distance, even if an Alben Barkley is in the Senate as Mr. Roosevelt's devoted agent. See, for example, their clash over the tax veto in 1944.<sup>45</sup> The student might well compare that clash and the language used during

<sup>45</sup> *Congressional Record*, 78th Congress, Col. 1981 ff.

its settlement with those of Clarendon as he describes the relations between Charles II and the House of Commons in 1661. Clarendon writes:<sup>46</sup>

These ministers had every day conference with some select persons of the House of Commons, who had always served the king, and upon that account had great interest in that assembly, and in regard of the experience they had and their good parts were harkened to with reverence. And with those they consulted in what method to proceed in disposing the house, sometimes to propose, sometimes to consent to what should be most necessary to the public; and by them to assign parts to other men, whom they found disposed and willing to concur in what was to be desired: and this without any noise, or bringing many together to design, which ever was and will be ingrateful to parliaments, and, however it may succeed for a little time, will in the end be attended with prejudice.

This is not far from a verbatim description of the United States constitution in the twentieth century in one of its most vital parts.

*A Suggested Remedy.* To remedy the weakness, the Report of the Joint Committee on the Reorganization of Congress<sup>47</sup> made the following proposal:

That the majority policy committees of the Senate and the House serve as a formal council to meet regularly with the Executive, to facilitate the formulation and carrying out of a national policy, and to improve relationships between the executive and legislative branches of the Government.

This, argues the Committee (which did not lack sifted information), is "in order to narrow the widening gap between the executive and the legislative branches." On this body such members of the President's cabinet as may be desirable would serve. Manifestly, when the two branches of the government are in the hands of different parties, such a hyphen would be neither desirable nor possible. Naturally, the act "to provide for increased efficiency in the legislative branch of the

government" did not provide for the above-mentioned arrangement among its clauses. If it had, one more law would have been condemned to almost certain desuetude. For the efficiency of such a joint committee depends on the willingness of the two branches to undertake and work it smoothly. But this depends on (a) the power of the President to rely upon the following of Congress when he has made commitments to the leaders, and they have made reciprocal commitments to him; and (b) the power of the President to prevent his own cabinet ministers from betraying him by a deal with Congressmen behind his back. Neither of these foundations is as yet built. The Report of the Joint Committee even admits elsewhere that party members are free to disregard the resolutions of their own caucus! The arrangement would be built on sand. And yet, every such structure may be a slight contribution to putting more responsibility on men to consider the views of a collectivity. Not much is to be expected of the device, but it must not be altogether discredited: it should be tried.

*Congress Intrudes in Administration.*

What disintegrates the executive, both when he seeks to form overall policy and again when he is bent on driving all the departments and agencies as a single team (this need not be done by any means too tautly), is the undoubted right of Congress to intrude in the executive and administrative field. The constitution limits only the number of subjects on which Congress may make laws, not the matter over which in each case it has authority. Congress passes and always has passed laws and resolutions and financial provisions which prescribe administrative functions, define the contours of policy in each agency, ordain specific administrative organization therein, and lay down principles of administration, procedures, and personnel.<sup>48</sup> (The Tennessee Valley

<sup>46</sup> Edward Hyde Clarendon, *Life of Clarendon* (Oxford, 1843 edition), p. 1093.

<sup>47</sup> Report, Joint Committee on Organization, March 4, 1946, U.S. Senate, No. 1011, p. 13.

<sup>48</sup> Cf. Justice Brandeis in *Myers v. United States*: "Obviously the President cannot secure full execution of the laws, if Congress denies to him the adequate means of doing so. Full execution may be defeated because Congress

## THE EXECUTIVE SEPARATED FROM CONGRESS

Authority statute is representative and very graphic.) Congress can tie the hands of the administrators of any agency very tightly, and it does. It gives them an extra wring, or loosens them, year by year when the budget estimates for each agency come before it. In doing this, Congress is making a quite rigid pattern within which the President is left very little discretion to guide, inspire and coordinate.

Already within eight years of the commencement of the federal government, Fisher Ames wrote to Hamilton the results of his own observation: <sup>49</sup>

What we call *the government* is a phantom. . . The heads of departments are head clerks. Instead of being the ministry, the organs of the executive power, and imparting a kind of momentum to the operation of laws, they are precluded of late even from communicating with the House, by reports. In other countries, they may speak as well as act. We allow them to do neither. We forbid even the use of a speaking-trumpet; or more properly, as the Constitution has ordained that they shall be dumb, we forbid them to explain themselves by signs. Two evils, obvious to you, result from all this. The efficiency of the government is reduced to its minimum, the proneness of the popular body to usurpation is already advancing to its maximum. *Committees are already the ministers;* <sup>50</sup> and while the House indulges a jealousy of encroachments in its functions, which are properly deliberative, it does not perceive they are impaired and nullified by the monopoly as well as the perversion of information by committees. We think the executive power is a mere pageant of the representative body—a *custos rotulorum*, or master of ceremonies. We ourselves are but passive instruments, whenever the sovereign people choose to speak for themselves, instead of our speaking for them.

It is no wonder, then, that the committees have, in the course of time, found it

declines to create offices indispensable for that purpose; or because Congress, having created the office, declines to make the indispensable appropriation; or because Congress, having created the office and made the appropriation, prevents, by restrictions which it imposes, the appointment of officials who in quality and character are indispensable to the efficient execution of law."

<sup>49</sup> Cf. Alexander Hamilton, *Works*, 1851, Vol. VI, p. 301-3, Jan. 26, 1797.

<sup>50</sup> Author's italics.

necessary to equip themselves with the same sort of expert staffs that the executive has, and that to these have been attributed functions and character very like those recruited in the British civil service for the assistance of ministers—a matter already noticed.<sup>51</sup> It is no wonder that the Congress has established the curious hybrids in administration: the regulatory independent commissions, like the Interstate Commerce Commission, the Federal Power Commission, the Federal Communications Commission, the Tariff Commission, and so many others, which, in the words of the President's Committee on Administrative Management, constitute a "headless fourth branch" of the government.<sup>52</sup> They were so established because Congress would not trust the executive with the administration of the main principles of policy which Congress might have confined itself to laying down in the act. Being thus established, they are not within the President's administrative power of control or inspiration. Nor is it to be marveled at that the powers given by Congress to the great interdepartmental offices previously referred to (price stabilization, of mobilization, of reconversion), actually grant their directors a power of control and direction far surpassing that exercised by the President himself under the direct grant of the constitution.

Thus, the Congress skirmishes in and out of the administrative agencies with its permissions and prohibitions, and thrusts deep into their organization and working.<sup>53</sup> Thus, also, Congressmen claim

<sup>51</sup> See p. 456 above.

<sup>52</sup> Cf. R. Cushman, *The Independent Regulatory Agencies* (New York, 1941).

<sup>53</sup> A particularly instructive example of Congressional interference with the administrative process comes to mind. In an executive order of June 24, 1938, the President authorized the Federal Civil Service Commission, among other things, "to establish practical training courses for employees in the departmental and field services of the classified civil service . . ." The Commission took its task seriously, and, working with the Council of Personnel Administration, the Office of Education, the heads of the employee unions, various officials throughout the government, and

and exercise rights of visit and interrogation, in their individual capacity, to the individual departments, and even to the individual bureau chiefs and other officials. And, naturally, some of the administrators become their friends, and so also the friends of the economic groups they and their visiting Congressmen serve. This lacerates administration, and pulls and plucks at it, until it slumps askew. The commonly harmonious values are subservient to the war of all against all, and the President cannot but be at the mercy of the engines he is supposed to utilize. What can he do alone?

Deliberately, Congress commandeered for itself the power to lead on the day it banished the executive chiefs from the floor of Congress. It thereby shattered the cohesion of the executive for the executive's own business. And, simultaneously it threw away the cohesion of its own proceedings by destroying an integrating executive nucleus that might have come into its midst replete with knowledge and stimulated by responsibility for enforcing policy at the point where the clauses of the law are being quickened into life.

The logic of the system has impelled and still impels Congress to fly in the face of John Stuart Mill's logic of representa-

tive government—that a popular numerous body is eminently fit to control administration, but not itself to conduct it.

THE PRESIDENCY CAN BE TINKERED WITH,  
NOT REFORMED

THE United States is more fortunate in its government than the lands of Europe which rule themselves through a cabinet system founded on parties too numerous to provide a stable and decided executive, for it has avoided confusion and excessive fluidity. At any rate, it stands for four full years, and if necessity should desperately press, it may serve as magnificently as in World War II. Yet it approaches the European governments in lack of effective vigor: Presidents may make many strong declarations, few are the means for fulfilling them. Nevertheless, the United States has been more fortunate than France, partly due to the fact that at any rate only two parties have occupied the main scene of legislation and executive control. When the need for action has become burningly urgent, what was needed was carried by a bipartisan if not a partisan grouping. Yet it is not enough.

*Comparison with British Prime Minister.* The British prime minister is happier than the chief executive of the United States, for his choice of partners is to a large extent made for him: it is made in the least troublesome way in politics, through the gradual selective process of a free parliament and a party in which a high degree of mutual trust prevails because men are bound together in a common enterprise in the service of common principles. The harmony (always relatively speaking), is a pre-established harmony. He is more fortunate than the President of the United States because he may normally rely on the continual and current assistance of almost all of his cabinet. It is their duty, indeed, to bring him aid and comfort, not least when it is in the form of frank criticism and even resistance based on party principle. All of them are political in the best sense of the word. He knows how far he

other persons, it produced a report leading to a new unit of training administration, and appointed, March 16, 1939, a Coordinator and Director of Training. Then a revised report was prepared called "The United States Civil Service Commission's Part in Federal Training," projecting many activities. It must be remembered that in-service training has now come to be recognized by every modern state in the world as essential to the proper performance of the tasks of the public service. But when Congress was asked for appropriations to implement this recommendation which had taken many months of hard work to devise, the funds were refused. (See *Annual Report*, Civil Service Commission, June 30, 1939, pp. 46-47). In 1916, the British civil service established an elaborate system of in-service training, substantially inspired by American thought and this latest experience. But once its advisory bodies had made recommendations which the Treasury could accept, and the cabinet had decided to support the policy of the Treasury, the House of Commons found the money—there was no hiatus between executive and legislature.

can go because his stablemates are with him continually, and all together face the common ordeal of the Forum, where some six hundred men, ready to take their places, are endowed by the people with the right to take them to task about detail even as about the most lofty principle.

The prime minister is mightier than the American President if he can carry his cabinet with him and then convince Parliament (and party affiliation has already made the latter an almost foregone though far from certain conclusion). For he is master not only of the executive but also of all legislative leadership and particulars. A seamless network holds together the prime minister and the cabinet and the Parliament. They are flesh of each others' flesh, in full sovereignty, for neither constitutional limitations nor courts declare them out of bounds: and they are still flesh of each others' flesh even when they are thorns in each others' flesh. The cabinet ministers cannot, as they succeed in doing in the United States, contrive to keep their departmental affairs out of cabinet discussions. The cabinet is precisely the place where all the cards are on the table, and where no one can keep the hand dealt to him covered up. Every man has the right to require his colleagues' hand to be placed face up. Nor can a British cabinet minister be maneuvered according to the rules of the game, as in the United States, not to challenge his colleagues' policy: the rule is that he is a minister precisely to do so. Most ministers will have been so apprenticed and selected that they can (as not more than one or two in an American cabinet are ever able to) offer valid contributions to the policy of all the other members of the cabinet. Each British cabinet minister is responsibly more fortunate than the departmental chiefs in the United States, because while he may be irked by the intervention of a colleague, it assists him, and enables him the better to bear his responsibility because it is thereby shared. And all of them together are better placed to take the initiative in administration and proposals for lawmaking, because they have learned

to appraise and follow the "sense of the House." When that is accomplished they have shared their responsibility (which always sits heavy on the head that wears a crown) with Parliament. They can always answer: "You were accessories before and during the fact!"

No such comforts or permissions and easements exist in the American system: it is powerful and powerless, harsh, laborious, and stultified. It has not even the advantage of a steady, united, and responsible opposition, for the factors that disintegrate Presidential leadership do the same damage to the party in the minority. Opposition there is—strenuous and strident. But it consists of the uneven sum of individual acts of opposition by Representatives and Senators. It is scattered, sporadic, unsteady, not too well informed, and lacks the moderation that issues from admitting that criticism invokes a principle of public welfare and that criticism constitutes a self-commitment for a future spent in office. For the separation of powers precludes any reasonable assurance of future office, or the power to implement one's policy if one ever attained it.

*Suggested Remedies.* Can it be remedied? No substantial remedy exists outside a surgical one which will introduce an equivalent of the British system. All gadgets may be tried: they will effect small improvements:

(1) Most radically, on this lesser plane, all branches of the government—House, Senate and President—should be elected for the same term—four years—and at the same time. That would produce a collective, national searching of heart, vigorous and vast.

(2) Two or three question periods a week before a joint meeting of both houses might be instituted. Yet what is the use of questions unless they are of disciplinary force and can exact commitments of the executive as the British are and do? Nevertheless, let them be tried. But what would happen if the President and his departmental officers were confronted with questions by a Congress held

by a hostile party? Congress would lam-poon them: a bear garden would result.

(3) The British government has found urgent and inescapable the need for an administrative class of career officials composed of some forty permanent under-secretaries and nearly four thousand assistants to them leading upwards to the political apex in a pyramid of age and experience. The French have accepted the need also. How much more desirable is this governmental device in a system where not only may different political parties follow each other from term to term in legislative and executive power, but where the President, because his party or his friends in his party have lost power in Congress, may suddenly find himself riding astride little more than a few cronies playing beggar-my-political-neighbor. One great permanent sturdy administrative bridge is needed—always open and open to all—over which both Congress and President of the same or different parties may safely travel—not the anonymous half dozen plus a précis-making staff secretary!

(4) Is it necessary to go beyond this? Undoubtedly. The Presidency should be truly collective: and that body should have the right of dissolution of Congress on vital issues in the estimation of the President and his group. Then the President would be elected at the same time as the new Congress was being elected. Elections might then be fought on emergent issues, whereas at present, issues are fabricated for elections at fixed times, putting a strain on everybody's honesty.

Nothing short of a radical reform can raise the government of the United States to the capacity needed to solve its domestic problems and to play its rightful part in preserving itself and furthering justice in the developing world order. If not, one day, a disaster will surely overtake the nation and its world neighbors. What do I mean by a disaster? Such things as not having coped reasonably and bravely with the prices problem after V-J day. Or, not having a unified mind to tell the public the truth about industrial production difficulties. Or not having

the unified will (of course, a steady opposition is always assumed) to take measures early enough to cope with depressions. Or not having a settled enough state of mind, owing to executive-legislative disintegration, to deal justly with capitalist and labor monopolies, oppressions, and cessations of work. Or not achieving adequate clarity and constancy to fulfill international obligations. Or suffering surprises like Pearl Harbor and its train of deadly consequences.

Many American political scientists recognize this picture. Indeed, their own research has principally contributed to its painting. Perhaps nothing can be done, since tradition, law, geographical extent and diversity may doom the land to incoherence of outlook and belief, and an invertebrate party system. Indeed, the government of the United States exhibits some of the incoherence which would undoubtedly characterize a world government, if it were democratic, and for the same cardinal reason—geographical extent and diversity.

It may be contended, when the student looks at European affairs, that after all, America has not done so badly in providing liberty, order, justice, and wealth. Do not democracy, freedom and justice, prevail, and at the same time is not the standard of living the highest of all anywhere? The point is rather that much more freedom for many more people could prevail, that justice could be more nobly conceived and more effectively administered, and that the standard of living could be higher for a far larger proportion of the masses, if the government were better built and conducted. The cavalier reply cannot be impeccably made that the land is so well off. One third of the nation is still ill-housed, ill-clothed, ill-fed, and sick for lack of adequate medical attention. A not inconsiderable contribution to American welfare happens to have been made by climate, land, and natural resources. So propitious are these that they have even encouraged governmental waste.

*If the Cabinet System were Introduced.* It is possibly a useful exercise to specu-

late broadly on the possible consequences of introducing the cabinet system in the United States, and then upon the factors probably inimical to its success.

A true collective cabinet, with a solidarity of responsibility, would be of assured value only for the coordination of the administrative departments, and the production of a concerted legislative policy. It could be quite successful and valuable in the former function, assuming an inward genuine solidarity of political outlook, but it would still be marred by the power of Congress to make laws which virtually dictate how administration shall be conducted. If Congress were at sixes and sevens in making these laws, so would the administration be in spite of the solid cabinet. As for the policy-creating power, the cabinet might be solid, but the cabinet could not be sure that its propositions, any more than today, would ever become law. A cabinet would depend as much on the good graces of Congress as the President does now.

*Consolidation of Powers.* It is therefore obvious that something more is required than merely to institute a solid collective cabinet. That something in addition must, I think, mean that either the cabinet is given all of the legislative power, or that to the Congress is added the executive power. It does not matter which of the expedients is adopted: the overriding principle is that either shall have the plenitude of power, that power shall be undivided, that responsibility shall be unseparated. If the entire power of government went to the Congress, then Congress would in time create its own coherent leadership, even if the constitutional reformers had not already done so. Whatever the details, the main feature would be that the executive would emerge from the leaders of Congress, like the British cabinet or the French council of ministers. All the advantages of a union of legislative policy and executive fulfillment and leadership would then be available. If, on the other hand, the executive were endowed with both legislative and executive power in their entirety, then the executive, being elected, and

founded on the principle of democratic representation and responsibility, would endow himself and be compelled to work with a council of leaders from the majority party. It might be a smaller council known as the cabinet, or a larger one which is the Congress and its committees. It might even be that this cabinet would be composed of the leaders of the Congressional committees, though in a vastly superior position of power and influence than the chairmen of committees today.

Hence, we see that to ordain a plural cabinet with collective responsibility is not in itself effectual to reform the system. We may also infer that the separation of powers, the existence of checks and balances, frustrates reform. It may be useful, but it is trifling, to propose question-time in Congress for the executive, solitary or collective, and to propose the regular presence of the executive and departmental chiefs on the floor of Congress. While the powers of proposal and of disposal are in different hands, the government remains weak. If the separation were overcome, then, in spite of the fact that the states retain a very large field of power, enough has already been granted specifically to the national government, and even more conceded by the Supreme Court, that a good, strong, active government would have been instituted. If, then, the present trend to the increase of federal powers continued, political parties might more seriously found themselves on public and national principle. They might better fit their organization to carry out the various functions to which we have given so much attention. The greater the amount of power, the wider the scope of government sovereignty to work weal or woe to men and women, to cities, states, interest groups, regions. The keener the interest in the quest for power and for votes, the keener also its accompaniment, the quest for as many votes as possible to challenge and oppose the majority. This would invigorate party principle, animate party organization, evoke and intensify the loyalty of leaders and followers in the electorate, the Congress, and the cabinet.

Power exercised in its entirety—that is, legislative and executive by one party—would solidify the opposition. The existence of an opposition, coupled with responsibility entire in its scope, and collective and therefore simple and single in its appearance, would stimulate the solidarity of the cabinet and its feeling of obligation for the public welfare. In other words, if somehow the reform were accomplished, it would go far to cure some of the evils which are often rightly stated to be the reason why the reform is not being undertaken: that is to say, the inchoate, the inarticulated, nation-wide parties. Local bossism might succumb to central leadership, if it were potent and brilliant, just as in the Presidential leadership of 1936 and 1940 Franklin Roosevelt was able to triumph even though the Democratic machine bosses detested the New Deal, for their own local tenures depended on the triumph of the candidate.

*Obstacles to Reform.* What factors are inimical to such reform? True, it would, if instituted, invigorate and reform the party system. But could it do so enough to become a viable system of government? It must be acknowledged that several powerful factors stand against the possibility. The first is the geographic range of the country, with its nature-determined regions, and the economic interests and therefore political loyalties based upon them. The most obvious is North and South. Another is East and Middle West. Another is the corn belt and the manufacturing and commercial regions. There are many others. Can a policy be found which can unite regional interests in a party, not merely for an election, but for decades and decades, so that a recognizable entity—party—survives the years, even if changes occur in its outlook? This is exceedingly doubtful. It is doubtful also whether the peculiar complex class composition and outlook of the British political parties can possibly have its counterpart in the American political environment, since the history and present composition of American economic groupings and opportunities have their

own peculiar characteristics. Nor can the various interests of states and cities be ignored. It would seem as though the very range and variety of American geography and economic interests doom the nation to inarticulated parties. If this be granted, the government is bound to be at once disarticulated, and only in the spasms and agony of disaster to make unified forward surges in policy. If party unification and loyalty were missing, so would the Congressional be, and so also, the cabinet's unity.

Other obstacles exist to a full cabinet system, furnished with the conventions that guide it in Britain. The Senate was deliberately set up to perpetuate regional obstructions on national government; consciously to disrupt unified political parties if they should ever arise. A constitutional amendment could abolish the Senate, but if the Senate were abolished, it would not reduce the natural factors in the American polity which produced the Senate in the first place: that is, once again, regional diversity. A cabinet system requires that we assume a legislature based on the homogeneity and the solidarity of the free and equal representatives who represent free and equal citizens without distinction of territorial blocs, or regional vested interests.

Though it may seem a little recondite, it is not altogether without point to observe that in Britain the existence of an hereditary chief of state—the Crown—helps considerably in maintaining the smooth operation of the cabinet government. The chief of state symbolizes the unity and continuity of the state, the political order: is a point of reference for dissolutions and the appointment and resignation of ministers. He is a fixed point in fluctuation. It has already been appreciated how difficult a problem it was to provide against a dangerous and inefficient dualism of the executive in Weimar Germany, and in the France of the Fourth as well as the Third Republic. One of the awkward problems of statecraft is the election of the chief of state: if by the people, he may seek power and he will certainly have been defamed by

some of the parties at the election. If by the legislature, then he will suffer the same fate of defamation and will most likely be weak. What would be the equivalent problem, what the chief of state, in an American system of cabinet government? The national government could hardly dispense with a chief of state separate from the prime minister and cabinet, and this chief of state could hardly avoid interfering with the cabinet.

Further reflection suggests that if the single executive gave way to the multiple executive in the United States government, the cabinet might be disintegrated by the demand of the various sections of the country for their own members of the cabinet in it. And, again, if the two-party arrangement did not continue at least as well as it now operates and if the government were no longer one of separated but of combined powers, the United States, having committed so important a stake to the political fight, might see the institution of multifarious parties, as in France or Germany or Italy, though inspired by different factors and seeking other objects. Then a cabinet system would be no gain, but a loss; for it would have cost the nation the executive stability provided by the fixed term, and transferred frustration from the separated powers to the segmented political parties.

Thus, it may be of the utmost importance to make a radical change in the central governing institutions of the United States; yet history, geography, and traditions may be insurmountable obstructions to anything but minor reforms.

*Presidential Responsibility.* Some observations on the nature of the President's responsibility need to be added. They are necessary because some men who see little hope of improvement in Congress believe that the "responsibility" for good government has been transferred to the presidency, since he is the only central political institution voted for by the whole people as a single national community, whereas the House of Representatives and the Senate are only the uncertain sum of hundreds of local elec-

tions in which local issues and local outlooks predominate.

Now, the President is "responsible" in the sense that he is vested with certain obligations by the constitution. So much is certain. But, in the first place, nearly all of those obligations and rights, whether executive or legislative, are expressed in highly general terms. That generality of expression throws back "responsibility" to the man in office. It is not outwardly to a document or the popular legislature that he must look to discover the clear lines within which he ought and is able to work. The contrast between Harding and Coolidge and Franklin D. Roosevelt demonstrates that. Therefore, the "responsibility" is mainly moral, that is to say, it stems from his own conscience and character. No Congress can harm a do-nothing President like a Calvin Coolidge, nor chastise a deserve-nothing like Harding; no Congress can altogether check the daring, like Jackson, or quell the bold and courageous, like Lincoln. His office is his, and he retains it for his four years. Congress can punish a President who desires to get things done, when he asks for money and laws for his purposes; but it cannot punish a President who is not interested in policy and action, for then it has no sanction over him. Accountability as responsibility is significant only in the case of active, aspiring, presidents. It may be urged that the President has a responsibility which issues from the fact that the people have elected him, and that he therefore owes them a duty. A duty may indeed be implied when a man has either asked for or not denied the candidacy. But the important question is, How is this implied duty to be made concrete and fulfilled? Presidential candidates are not usually given to being specific over the whole range of policy. In some branches they have no competence, for it belongs to Congress. They conduct a campaign in company with some party friends—they give one knows not what hostages to them. Many situations are obscure at the time of election. Where is the responsibility for dealing with them

later? It may be argued that the candidate ought to be conscious himself of his policy and specific in his commitments. This desideratum may be not only conceded but even urged. But though a Presidential candidate may be the author of promises, he is not the master of their fulfillment.

Assuming that a responsibility is acknowledged to the people, it cannot be comprehensive, it cannot be specific, it is incapable of full and specific performance: though the performance may, in fact, be partial and specific, and even clever and appropriate to the problems at the moment when they are actually reached. Assuming, once again, that the President is responsible to the people as the nation as distinct from the people in Congress assembled, how can the responsibility be brought home to him in the years between his election and the end of office? It may only be by deputations, correspondence, and the press, the consultation of public opinion polls, of which the greatest as well as the first master was Franklin Roosevelt. Can this be said to be an exact responsibility? The continual stream of public comment, appeals, reproaches, and scorn may induce or lash him into promise and action. The polls of popularity are watched and followed with considerable sensitiveness by the dweller in the White House. It still leaves the President to formulate his will on the matters brought to his attention in this way. He can transmit the impressions and impulses he receives to Congress, he can stimulate the stream of communication to him and to Congressmen by the use of publicity devices: the radio and the press conference, and the White House chats to visitors, and speeches on special occasions in various parts of the country. He can bring together and exert appealing influence upon conflicting groups in industrial warfare. He enjoys unrivaled opportunities and prestige for the mobilization of public opinion. But his responsibility to use them—and, having used them, to transform the aroused emotions and wills into law and administration—is still once again to be deter-

mined only by his own conscience and character. His term of office is not subject to the will of a controlling Congress, nor, unless he desires a second term or more, to the people's will. Hardly even where a President is anxious to secure re-election is it possible to think of "responsibility" in the sense of accountability, as it operates to rule a cabinet in Britain or France.

All the rest—with the exception of that rusty but still constitutionally available method of impeachment for crime and misdemeanor—all the rest is moral responsibility, the affair of a President's conscience, the pangs he feels. It can either be insufficient, as in the case of the weak Presidents, or it may, as in the Presidential attempt to reform the Supreme Court, be excessive accountability as responsibility stimulates, moderates, and guides; it is the preceptor and corrector of government; and this office is best managed where the government (in this case, the President of the United States) must account to an intermediate body between it and the people, so amorphous and widely scattered. And it becomes the more sensitive and helpful an instrument where both the agencies of government, the controller and the controlled, are not assured of fixed terms of office.

*Responsibility and the Facts.* Hardly a day goes by without a threat by congressmen that they will not find the funds for the President's policies, especially for foreign policy and military expenditures, unless the President "tells us all the facts—all." Now neither the House of Commons nor the French National Assembly is ever told all the facts. Nor can any assembly of hundreds of people, nor the people as a whole, ever be told all the facts, at the time they themselves demand. For one thing, the facts in their entirety that may be requisite to a right policy may not be available even to the executive. For another thing, some of the facts (in foreign policy especially) cannot be immediately told, lest they should make peaceful continuation of negotiations impossible. To tell may actually undermine the nation's ability to defend itself by the disclosure of information, by re-

vealing that the nation is able to get information through its secret service or through the cracking of a foreign power's codes.

Far more important is the truth that a point is frequently reached where a transition from the facts to a decision must be undertaken though all the facts desirable are not yet obtainable. Policy is very frequently the offspring of inference, and no other basis than this is at hand. Yet the policy must be formulated and applied without waiting, lest events bring irrevocable disaster to the statesman and his people. But it is precisely at the frontier of inference and guesswork, in the twilight zone between facts about the past and firm resolutions about the future, that Presidents and Congresses may most seriously differ and dispute. The point has been admirably put by Justice Jackson speaking in 1948 for the Supreme Court in *Chicago and Southern Air Lines v. Waterman S.S. Corp.* (68 S.Ct. 431): "They [executive decisions as to foreign policy] are delicate, complex, and involve large elements of prophecy."

In the British system of government, and even perhaps in the French, though it is weaker, the unintermittent merging of executive and legislature, the ever-continuing life in each other's physical presence, is some assurance of the unison of mind which leads to a unison of guesswork, and therefore to a sharing of responsibility for policy. It enables a measured trust in the executive that purges a peevish demand for "all the facts." The United States President is, on the other hand, compelled to face the task of correct inference from uncertain premises alone—this is a burden of all governments, everywhere, and at all times in human history. It is a dreadful burden for a solitary man, even if assisted by a few faithful friends, to bear alone. Accompanying it is a twin burden: that the knowledge of the facts and the consequent guesses must be carried forward in a state of tentativeness and uncertainty, in a condition merely of temporary probability and yet of possible final certainty, in face of a clamant people

anxious to learn what sacrifices, what burdens, what happiness or unhappiness the future holds in store for them, and a people also, to whom the President owes an accounting. Particularly when the horror of war or the misery of depression is being faced is it difficult, as electorates now are, to release the secrets of fact and conjecture, when this may mean undeliberate, emotional behavior by popular groups, which would not occur later when time and events have ripened and made concrete the surmises which the statesman is obliged to nurse. The President is in a position where he can see much further than most people in the nation, even than the most enlightened publicists, but he is in a position where he must not talk as much as undutiful ones. He must bide his time, suffer the criticism until the day of reckoning, and hope that his prophetic thinking is sound enough to redeem his reputation because it served his people. A true political party system tends to guarantee that the executive and the legislature share in common the values involved in inference and prophecy. Without it, the President bears an awful burden indeed.<sup>54</sup>

*Planning and the Presidency.* If it is ever found necessary—under stress of war or the emergency of a more disastrous depression than that of 1929 to 1936, or, more likely still, under a democratically developed conviction that social control of economic activity is conducive to liberty and welfare—to institute planning on something like the scale of contemporary Britain, then no doubt can possibly prevail that the Presidential system must undergo the most drastic reform. With it Congressional-Presidential relations would be transformed. A new coherence among the institutions of leadership and control would need to be established, and a real sharing of responsibility would have to replace the crude checks and bal-

<sup>54</sup> Professor Charles A. Beard's utter failure to acknowledge these truths about guesswork utterly vitiates his study of Rooseveltian foreign policy between 1933 and Pearl Harbor. Cf. *Roosevelt and the Coming of War* (New York, 1948).

ances of the horse-and-buggy age. The struggle against George III in the eighteenth century was different in kind from the twentieth century's encounter with giant masterful economies and relations with spirited and powerful independent sovereign nations, and the instruments of man's contemporary well-being should be appropriately contemporary.

A recent study has made a most cogent and comprehensively stated case for planning auxiliaries for the President.<sup>55</sup> But what stands out starkly in the argument, and what the sincere author finds to be an obsession to which he must continually return, is the constitutional power of the President by himself to thwart or advance the policies which emerge from his advisers. He says:

It is obvious that the administrative effectiveness of a central planning agency must depend on its relation to the President. The Office of the President is more than a government institution; it is even more than the reflection of the peculiarities of an individual personality. No organizational device can strengthen the backbone of a timorous President. No administrative arrangement can alter a fundamental conviction of a chief executive. The experience under the Employment Stabilization Act of 1931 clearly revealed that a mere legislative declaration of policy and the establishment of some administrative machinery did not automatically produce administrative action. President Hoover was not disposed to move even under the conditions which were overwhelming him. The answer was not different administrative machinery, but the election of 1932. Planning leadership, then, in the last analysis must always depend upon the personality of the chief executive.

The same single-handed power of the President to make or mar the government of the nation appears from reflection on one of the most interesting proposals ever made to surmount the combined effect of the separation of powers and the solitary executive. It is that made

by Professor W. Y. Elliott, before the Joint Committee on the Organization of Congress.<sup>56</sup> He proposed the institution of some half-dozen councils or committees, each covering a broad field of policy and administration: thus, foreign affairs, defense, fiscal policy, social security and social services, physical resources, commercial policy, and legal and organizational matters (civil service, etc.). Each of these councils or committees would be manned by a number of departmental chiefs, and it may be some of their immediate advisers, and some Congressmen of both minority and majority parties. Presumably, the chairman would be the departmental chief whose department was the principal focus of the field of policy covered—thus, for foreign affairs, the Secretary of State, or today for defense, the Secretary of Defense, and so on. The proposal was in part stimulated by President Roosevelt's action at that time of taking the Republican leaders as well as his own party friends into consultation on foreign relations, and by the operation of the Committee of Imperial Defense in England. But the proposal was not wedded to the chairmanship belonging to the principal department chief, since its author talks of the President placing direction in the hands "of a trusted staff adviser, who could act as the focal point for the formulation of policies." And, furthermore, the author had proposed to the President's Committee on Administrative Management that the six aides to the President should conduct coordinating work in this very sense.<sup>57</sup> It would be left entirely to the President to decide whether the opposition would be members of the committees, and to him also what individuals should be called, whether of his own party or not.

Then, the six committees, already coordinating large provinces of cognate subjects, would themselves be marshalled by a single chief of staff to the President.

<sup>55</sup> Cf. J. D. Millett, *The Process and Organization of Government Planning* (New York, 1947) p. 163. In both a civil and military capacity the writer has been close to the centers of federal governmental planning.

<sup>57</sup> *Ibid.*, p. 964.

## THE PRESIDENCY CAN BE TINKERED WITH, NOT REFORMED

It is essential that the President should have . . . someone who would perform the kind of "Chief of Staff" functions that have been put upon, first, Justice Byrnes, and now upon Judge Vinson in the Office of War Mobilization and Reconstruction. Such a Chief of Staff, either especially named, or made Director of the Bureau of the Budget, might readily organize these staff functions of the six groups . . . for bringing together in a manageable way the reporting of information, the research, and the policy clearinghouse upon which both President and Congress must depend. I would make bold to say that during the five years that I have spent in Washington, the major difficulties which we have encountered have arisen from the lack of adequate staff planning and coordination of policies, quite as much as from the inevitable difficulties of an improvised administration faced with the gigantic problem of modern war. We need to look ahead as to the effects of policies, of conflicting jurisdiction, and not to have all our time taken up in trouble-shooting avoidable messes.

These staff assistants to the President, at the head of each committee, were not designed as super-cabinet officers, but chairmen of advisory staff committees, whose responsibility would be to the President through a chief of staff. "Short of the President, and in the last analysis, of Congress itself, there can be no ultimate policy resolution" under the existing arrangement.

The prime problem still remains with us: Could such coordination be effective, even on a lower plane than the highest policy, while all policies, and especially crucial and unresolved ones, must go to the President, and when all those that are resolved virtually take the authority out of the hands of the President though still leaving him with responsibility? Could he possibly yield the supreme coordinating authority to his top chief of staff without emptying himself of power? The answer to that lies in President Roosevelt's admission, reported earlier in the discussion.<sup>59</sup>

The President needs more than help: he needs to be put into commission—but a true collective commission, virtually

elected by the people, and merged with the legislature. It is no longer possible to repeat, with what seems to have been an air of satisfaction, Justice Brandeis's dictum that the doctrine of the separation of powers was adopted by the convention of 1787 "not to promote efficiency but to preclude the exercise of arbitrary power. The purpose was not to avoid friction, but, by means of the inevitable friction incident to the distribution of the governmental powers among three departments, to save the people from autocracy."<sup>60</sup> It may be true, but is it relevant?

If, then, radical reform is not possible, let us not believe that an incantation about "responsibility" and the wealth of the United States is enough. We owe ourselves clarity.

I have put the difficulties in the way of reform with full force, so that it may not be argued either that I do not know them or that I ignore them. Yet such difficulties may be overcome by a change of mind among those who can lead public opinion. It is a change of mind and intention that is needful. What an era of continued impotence, floundering, and corruption would British government still have suffered, if Jeremy Bentham and his one handful of friends had not dared to invent what was necessary and right, and proceeded to agitate for its acceptance! No vested interest in small-time pottering ought to be allowed to obstruct the upsurge of young men devoted to a new and more effectual vision.

What is of the most urgent importance is that no American student, and still less any American teacher, should permit himself to be seduced into not seeing faults and remedies just because they may have been rehearsed by foreign observers. The most public-spirited attitude surely is that which may be suggested by Rembrandt's picture, "The School of Anatomy." The teacher stands at the table with the scalpel; the body is laid open; the students observe. Is the man with the scalpel concerned with the nationality

<sup>59</sup> P. 671 above.

<sup>60</sup> *Myers v. United States*, 272 U.S. 52 (1926).

## THE UNITED STATES PRESIDENCY

of the dissected body, or is medicine his first loyalty? Can you identify the nationality of the man on the dissecting table? Will the gazing students shut their eyes, simply because the teacher may have come from abroad, from Padua, or Bologna, or Oxford, to the things revealed to their minds by his neutral steel of in-

sight? And, if the heart laid open should prove not to have done its duty to the now no longer living arteries, will they because they are Dutch, and the teacher is French or Italian or perhaps a Spanish friend of Cristoforo Colombo, say, despite the final cold facts, "The heart, nevertheless, is sound"?

*Some Concluding Observations*

If there were always at the head of the administration a man whose comprehensive genius embraced all the circumstances, whose responsive and flexible mind knew how to conform its plans and wishes thereto; who, endowed with an ardent spirit and a tranquil reason, were passionate in the pursuit of the good, and calm in the choice of means; who, a judge upright and sensible of the rights of different classes of the community, knew how to hold the balance between their pretensions with a steady hand; who, conceiving a just idea of the public weal, promoted it without precipitation, and, considering the passions of men as a fruit of the earth, proportioned their development to that of eternal Nature, and set up no picture of perfection except to excite his own courage and not to irritate himself with the obstacles. . . .—N E C K E R

Nothing goes by itself: that is one of the errors of administration.—  
N A P O L E O N

## *The Civil Service in the Modern State*

THE function of the civil service in the modern state is not merely the improvement of government; without it, indeed, government itself would be impossible. The civil service is a professional body of officials, permanent, paid, and skilled. Its numbers are a measure of the activities of the state and an indication of its nature. Already the totals of public employees—taking central and local government together, and including the industrial staffs—range from some one in ten of the gainfully occupied in the United States to something like one in five in Britain, France and Germany. The increase during the last hundred and twenty years is shown in Table 22, and it can be forecast that the numbers will increase.

### THE GENERAL ASPECT

FEW doctrines are more productive of error than that which avoids the solution of the difficulties of state activity by abstractly relying upon the term "institution." It is certainly a valuable gain made in the written and oral teaching of the last fifty years that the too familiar abstractions of "sovereignty," "state," "government" have been at once reduced in their traditional authority over our minds and enlarged in body and perspective to mean concrete institutions.

Yet institutions are nothing more or less than men. No institution rises above the quality of its inventors and personnel.

The ultimate possibilities of solving problems of government lie in the nature of the men and women who compose the institution. Plato did not err when he concentrated upon the training of his Guardians, and much political thought since his day has been a rediscovery of his supreme insight.

Modern governments assign the rights and duties of government to almost all "uncertified" people over 21 years of age. Our inquiry into the practice of government has already included the voters and their representatives. It must now proceed to consider these among the population who have adopted the service of the state as a professional career. We have, indeed, already made it plain that the efficacy of state action is far from being dependent upon the professional servants of the state alone, for it receives its animation and direction from the psyche and resources of the general population among whom the civil servants work. It is equally true, however, that be the population and their resources never so favorable, the quality of state action can be reduced to a base level by the unsuitability of the professionals and their organization.

Indeed, this problem tends more and more to outweigh any other in the modern state and even to assume a critical importance. For the actual and immediate application of political power to cases varying from one person to the whole population is carried on by the

1821	27	14.1	—	30.4	[1800 23 1850 25]	11.6	—	—	8	9.6	1821
1841	17	18.5	90	34.2	25	15.0	—	—	23	17.1	1841
1861	59	23.1	248	37.4	—	18.5	—	—	49	31.4	1861
1881	81	29.7	379	37.6	152	27.5	452	45.4	107	50.2	1881
1901	153	37.0	451	39.0	250	35.0	907	56.9	256	76.0	1901
1911	644	40.8	699	39.6	342	41.0	1,159	65.4	370	92.0	1911
1921	958	42.8	1,212	39.2	390	38.1	1,753	63.2	597	105.7	1921
1928 <sup>g</sup>	1,024	44.7	1,008	40.7	443	39.1	1,187	64.4	609	122.7	1928
1946	2,336	47.8	1,429 <sup>h</sup>	40.5	—	—	—	—	2,128	146.0 <sup>i</sup>	1946
Labor force (approximate)	—	21.0 (1946)	—	21.0 (1946)	—	14.0 (1939)	—	34.0 (1939)	—	60.0 (1946)	

<sup>a</sup> *Caution.* In spite of the greatest care and use of the best sources, these figures are only approximate: it is highly dangerous to compare those for each country in different years (since census methods and scope have varied), and even more dangerous to compare the figures for different countries since here even the definition of civil service varies. We have attempted to include all paid, professional, full- and part-time civil servants of the central and local authorities, *excluding* military and naval services, judges and magistrates, police and teachers. We have *included* all other civil servants whether "established" or "unestablished," whether administrative, clerical, manipulative, or "industrial" (i.e., postal and railway workers, for example), whether drawing salaries or fees or wages. The task has been exceedingly difficult, and there are errors and uncertainties. A fascinating history could, of course, be written, recounting *why* the growth we record took place. Cf. F. Morstein-Marx on this subject relating to Germany, *American Political Science Review*, 1935, p. 451 ff.

<sup>b</sup> We attempted originally to include only the servants of the central authority, but France and Germany lump *all* officials together; their method was followed in order to get the major amount of comparison possible.

<sup>c</sup> Census returns, occupational analysis, for 1861-1921; for 1928, *Treasury Memoranda to Royal Commission on Civil Service*, 1929, with 1921 figures of local government servants.

<sup>d</sup> No local government officials included until 1861. In earlier years there were none; later, not available until 1861. The apparently astonishing leap after 1901 is due to the inclusion of large classes of "additional" workers, i.e., mainly industrial and manipulative. The census, before 1911, was unsatisfactory on this score.

<sup>e</sup> Computed from *Bulletin de la Statistique Générale de la France*, October, 1913, article by Lucien March, "Contribution à la Statistique des Fonctionnaires." Figures for 1841 are those for 1839, and are central officials only; figures for 1861 are really for 1866. Figures for 1921 are from Census (*Statistique Générale*), Vol. I, Part IV; for 1928, from information supplied by Lucien March, of the *Institut de Statistique de l'Université de Paris*.

<sup>f</sup> Figures for 1800 and 1850 represent central officials only, and include police. They were supplied by ministerial director, Dr. Arnold Brecht, of the Prussian Ministry of Finance, with

## THE GENERAL ASPECT

civil service, and not by the people, legislature or executive. How far does a close view of the apparatus of public administration warrant such a judgment of the importance of the part played by the civil service? The answer to this question hangs upon two considerations: the nature and the extent of state activity, and the comparative contributions therein of the politician and the administrator.

It must already be quite clear that the salient feature of modern government is its positive and wholesale activity. That does not mean that in earlier ages the state either theoretically or actually abandoned a positive part. We have seen, on the contrary, that this was not so, and that, in fact, the state from its inception onwards claimed and exercised the power to regulate and control social activities over large territories and wide fields of human enterprise. Except for a short period, from about 1800 to 1832, state action did not slacken though it may have been incompetent. It is highly probable, also, that the regulatory power of the state will go on increasing, perhaps for centuries. That which is novel about modern state activity, and that which, also, causes us to believe vaguely that it is an entirely fresh phenomenon, is its extent and method. Nothing like such regulation of human activity has been attempted outside ancient theocracies.

Further, this activity differs from the old in its scope, its minuteness and its instruments. In scope, it hardly fails to envisage any branch of the moral or material sides of human endeavor. The record is written on the roads, the gutters, and the buildings, and spells what the state has done in order that society may have a modicum of wisdom, protection of person against criminals and mechanically propelled vehicles, environmental and personal defense against deadly bacteria as well as against economic misery. The annual thousands of rules and orders, the detailed and present plan of activity of all modern states, reveal how the state concentrates upon each individual and weaves his every impulse into the myriad-threaded warp of its existence. No second in the day is unprovided for; and for the many simultaneous events of each second there is the exact and predetermined form or officer. Though some may not admire, few can fail to wonder at, this vast, involved scheme, which no single mind has ever completely analyzed in even a thousandth part of its extent. The state is everywhere; it leaves hardly a gap. But it is different today than, say, in the eighteenth century, when it could do little more than make a claim to power by issues of statutes, orders, proclamations, and rules, while now its own professional servants calculate, control, and

reserve. Thenceforward to 1911 they were obtained by computation from the *Statistisches Jahrbuch für den Preussischen Staat*, which began in 1903. Figure for 1921 from *Beamten-Archiv* (1921) with allowance for local government; for 1928 from *Finanzstatistiken Teil der Statistischen Korrespondenz*, Berlin, October 3, 1930. Naturally, the Prussian figures are from 1871 onwards a constituent part of the *Reich's*. They must not be added together.

<sup>a</sup> Occupational census in *Statistik des deutschen Reichs, Neue Folge*, 1882, 1895, 1907, 1925. For 1928 the analysis in *Wirtschaft und Statistik*, 1930, p. 650. When the Prussian figures are subtracted from those of Germany (which includes all the states, all the local authorities, and the federal government), the figure remaining is one for all the other states and local authorities and the federal authority.

<sup>b</sup> *Statistical Abstract of the United States*, 1930, Table 177. This is for the federal authority only. To find the full number of American central and local services would involve discovering undiscoverable figures of the forty-eight States and all the local authorities.

<sup>c</sup> Of which about 1.4 million are local, including teachers. Nationalized corporations excluded of *Monthly Bulletin of Statistics*.

<sup>d</sup> Of which about 360,000 are local, including teachers. State industries excluded. Figures supplied by French Information Service (New York) from computations of the Civil Service Commissioner in attendance on the President of the Council of Ministers.

<sup>e</sup> Add some 3,000,000 for states, cities, counties, etc. Figure in table is for June, 1947. U. S. Bureau of the Census.

## THE CIVIL SERVICE IN THE MODERN STATE

apply those commands. Where formerly the state was wont to issue a proclamation, it nowadays deposes an officer. Few states have ever imagined that to command was enough, but no states until the eighteenth century began to employ public administrators on a scale sufficient to make the commands effective. Where the state used to rule by punishing offenders after the law was broken, it now anticipates errors of personal and corporate behavior and seeks to prevent them by the action of its officials. Even in the eighteenth century only one state, Prussia, had arrived at anything like our modern perception of public administration managed by a force of people, especially and systematically trained, recruited, and paid, to the exclusion of any other occupation, to execute the commands of the state.

The civil service is as much the product of the spiritual and mechanical factors of western civilization as are all other political institutions. The nineteenth century turned away from the impotent survival of unsalaried, untrained officers, who, as the records of the seventeenth and eighteenth century show, were illiterate and unwilling whether they were of the common people, the lesser gentry, or the nobility. Gradually the "honorary" officer ceased to play a part in translating the commands of the estate into social and individual behavior.

For two things were realized, though not uniformly in the countries under discussion. The first is that a rational order in industrial effort and organization demands the inclusion of all the best-skilled elements to do the required work, regardless of their social position, religious beliefs, political party, and (more recently) their sex; and the exclusion from the administrative apparatus of all those with such adventitious qualities, but lacking the specific skill. The tendency toward economic rationalism which triumphed to such a degree in the field, the factory, the office, and the stock exchange triumphed also in the creation of the civil service.

Second was the realization of the social

advantage of division of labor. More conspicuously in the nineteenth than in any other century, did people group themselves into trade and professional categories moved by the vague sense that only in this way was the maximum amount of skill and productivity attainable. Society could now obtain the high standard of living which had become its god, by the knowledge and use of scientific technique functioning in a highly complicated organization. This technique could only be acquired in its minutest exactness, and practiced with the highest efficiency, if people undertook only as much as could be mastered. One branch of such science and art was administration or management, and such a profession of administration could be exercised under either private employers or the state. Indeed, recent discussion goes far towards assimilating private to public officialdom for purposes of scientific analysis. The activities of the state grew enormously for reasons we have described elsewhere, and with them, naturally, the managerial class<sup>1</sup> necessary to carry them out. It is clear, then, I think, that the growth of some of the cardinal and least-questioned principles of modern civilization brought about the establishment and growth of a professional civil service, and that the realization of those principles would have been impossible without such a service. Nor must we forget the part played by the democratic urge of "the career open to the talents," produced by the belief in the equality of men, the desire for freedom of opportunity, and hatred of the official privileges of the aristocracy.

Modern states, then, directly employ very large numbers of people who make the service of the state a life-long professional matter. It would be possible, or it is at least conceivable, that the legislatures, jealous of the public officials, might themselves attempt to formulate the rules and regulations to implement the statutes. If they did so, we have amply

<sup>1</sup> I used this term ten years before James Burnham's *The Managerial Revolution* (New York, 1941), and use it still without his extreme conclusions.

shown that they would need to increase their own numbers enormously, reorganize their timetable, and revolutionize their working habits and procedures. They would in fact have to supply themselves with whole-time experts. And if they tried to emulate the ancient city-states and to accomplish the actual enforcement of law by officials who were elected for short terms and unpaid, the laws would in fact not be enforced. The task to be done is immense (departments of government employ anything from two or three thousand to over a hundred thousand). The intricacy of the task, the need for continuity and regular and punctual attention, with a sense of enduring and unslackening responsibility, and above all, the scientific and technical knowledge required, make impossible any substantial reliance for the actual operation of the services on the people, the legislature, the political parties. A reading of the list of the hundreds of different jobs under the broad classifications of any civil service will indicate the concrete activities for which alone a lifetime must be spent to secure mastery and efficiency in practice.

The part played in government by the civil service is, then, of tremendous importance. In what respect are they governors? What is their part relative to that played by those other and elected elements who stand in the closest connection with them?

The earlier discussion in the chapter on the separation of powers has explained the politico-administrative connection. The business of the electorate, of legislatures and chief executives, is a double one: it is compounded of conflict and propulsion. They undertake to overcome popular opposition to their schemes for using the national resources, and by a multitude of devices, from academic discussion to the ruthless use of violence, they make their scheme effective. Those who triumph, and thereby come into possession of the legitimate power of the state, could, it is conceivable, employ their own party followers to help them to carry out their policy, and for centuries, in fact, this was considered good poli-

tics and adequate administration. But this practice was made impossible *first*, by the growth in the scope and detail of social policy, the division of labor, which, claiming the continuous energy of men in a set and special field, reduced the number of potential party rank-and-file; and *second*, by the need for technical skill. Thus the political power acquired by electoral victory, or through the influence of the privileged, had necessarily to be distributed among the few who acquired authority to command, and the many who were permanently employed to serve by the best technical means. Because the authority of scientific technique has so won its way among all sections of the population, it is now an almost universally accepted idea that those who professionally serve in a technical capacity can do so without affecting policy, or if they affect policy, that they do this impartially, without political tendencies and intentions and as a result of the sheer scientific value and significance of their advice and their assistance. They are the human transmitters of general forces and laws and nothing more. It is because a dozen or a score of men cannot today manage millions of people without a large body of servants and much machinery, and because a vast range of science, which the politician does not possess, is required to accomplish this, that we say that though the legislature, the cabinet, and the presidents may rule, the civil service administers.

It is a mistake in observation to lay the main weight on the public services as the "core of the modern state." "The core" is a misleading metaphor: it obscures the practical as well as the theoretical supremacy of public opinion and the elected legislatures and executive. Being a mistake of observation, it is accordingly wrong doctrine. It is, moreover, likely to be productive of a faulty public ideal. (Max Weber was first responsible for this bias.<sup>2</sup>) But an enormous and indispensable

<sup>2</sup> *Parlement und Regierung* (München, 1918), p. 14: "In the modern state the real government effectuates itself neither in parliamentary debates nor in royal proclamations but in

## THE CIVIL SERVICE IN THE MODERN STATE

ble service is rendered by the great corps of professional and scientific and administrative and clerical experts, together with their manipulative assistants. They contribute special expertness: they know the facts. They work as continuously and as long as a rational plan for the job to be done dictates, not under the artificial limitation of electoral periods. Whereas the politician who directs them is the instrument of popular desire and will, the public official supplies the natural or social-scientific veracities which determine how desire may be fulfilled or whether it must be modified or abandoned. He indicates ways to satisfy desire or will with the minimum sacrificial obligations which citizens must bear if laws are to be carried out. I need go no further in praise of the expert, though in view of some essays on the limitations of the expert—by whom our civilization lives—it would be in order.<sup>3</sup>

### THE NATURE OF CIVIL SERVICE ACTIVITY

WE must now attempt to answer the question: what general qualities distinguish the activity and organization of state servants? and we may do this by describing them with comparative reference to the qualities of private industry. In this way we shall discover the features upon which to fix our attention.

*The Urgency of State Services.* Not all the services rendered by men to each other come equally under control of the state. Some, indeed, are entirely uncontrolled by the laws. There are very few such services. It is easier to see the varying extent of control, which ranges from the official registration of contracts to the actual stipulation of prices and the management of industries; from the cleansing of a street to the compulsory isolation of a fever-stricken citizen; from the application of general principles of "public-

policy" to the compulsory supply of certain services.

What impelled men to force the state to take upon itself these functions? These functions were undertaken because they were so essential to the maintenance and continuation of the state desired that their conduct could not be left to the privately established institutions of individual persons. This was shown by experience. Fear, pride, pity, charity—and a hundred other human elements—operated along devious and amazing ways to cause men to demand the large-scale, socialized, and permanent organization of certain services. Such were the relief of the destitute and the organization of the labor market, the provision of public health services, free education, the building of highways, the running of postal services, and many others.

All these services have certain common qualities. All have a quality of urgency, an urgency which takes its tone from the publicly accepted philosophy of the time. They are urgent because a high standard of living is desired, or because illness or death may result from their absence, or because—we do not quite know why—it is morally right, and here our reasons border on the mysticism of religion and are supported by vague conceptions of God, Progress, Evolution, Reason, World History, the Future, and many other things to which we have as yet given no name. When the urgency of these desires seems unlikely to obtain satisfaction from the independently created agencies of individual men, the state is asked to shoulder the burden. And so the state, as we have already said, becomes many things: a telephone, telegraph, and postal company, one enormous hospital, an army, a navy, an electricity-supply company, an association for the organization of trade relationships with other countries and within its own territory, an informative research service, a giant school with many grades, an insurance company, a bank, a coal mining corporation: the list of the state's incarnations is inexhaustible. But the state is incarnate because a special urgency affects each of these services.

---

the exercise of administration in daily life, necessarily and unavoidably in the hands of the civil service."

<sup>3</sup> Harold J. Laski, *Limitations of the Expert* (Fabian Society, London, 1935); Ernest Barker, *Reflections on Government* (Oxford, 1942).

It is a risk—nay, a peril—which the majority of inhabitants cannot contemplate undertaking (so experience has shown), to leave private, uncoordinated activity in charge of such services. Hence the special emphasis upon continuity in the public services; the tendency to keep governmental activities immune from judicial control and punishment; the great prestige attaching to official appointments, with the frequent corollary that men serve with their highest energies regardless of monetary reward, while with some the power flies to the head, and their conceit issues in disobliging “bureaucratic” behavior.

*Large-Scale Organization.* An activity of the state has usually been commended for control or management by the state because it is desirable that roughly the same main principles should be operative all over a large area (e.g., public education), or because safety of health or person demands it (e.g., motor-truck certification), or because it is economical to plan and operate over a large area (e.g., transport), or because some peculiar efficiency is to be obtained by central initiative (e.g., management of coal mines). For economy it is necessary to avoid duplication of lesser staffs and to concentrate control and operation in fewest hands. This is not a doom of the state's activities. Decentralization is possible and is one of the rationally conducted acts of modern administration.<sup>4</sup> But usually the organization under one control is large. Hence, much administration is accomplished not by immediate personal confrontations of the situation to be solved—and all situations are local and personal—but from afar, by writing, and report, and recording, and paper analysis. This is mitigated by the fact that modern communications make possible more than ever before action or investigation on

the spot by central officials. The defects of centralization are also mitigated by the remarkable development of standards and units, costs, and results, so that local observers can transmit to the center reports and figures which have the same vivid meaning at the center as they have at the extremities. Yet the personal impact of the complainant consumer is desirable. Too much public service activity is still impersonal.

*Monopoly and No Price.* The state's services are completely, or almost completely, monopolies; and the state renounces almost entirely charging the consumer a price, or a direct *quid pro quo* for value received. It treats all its clients alike, and does not charge what the markets will bear or make a profit on one citizen to recoup itself for the loss on another. The public services operate, fundamentally, to make universal provision of a necessary service to all who need it. The principle of price in a competitive market full of competitive consumers is discarded.

Since the state has a monopoly, its service cannot be judged by the results attained in like industries operating outside state control. Nor can the citizen threaten to find a competitive service of supply. Since the state charges an equal price to all, or no price whatever, a quantitative estimate of value is lacking, and the consumer is deprived of the ordinary means of expressing his judgment. As a rule, the consumer measures the difficulty of earning—or the unwillingness of parting with—his money, against the satisfaction he anticipates from a commodity or service he desires. He can pretty flexibly register his judgment of the comparative value of different quantities of goods at different prices by means of a price paid or withheld. Anticipation of his demand causes the production of goods in the special quantity and quality and time called for. The supplier who meets the conditions profits in proportion as he meets them: he who does not tends to become insolvent. There is a fairly direct relationship between efficiency and profit, value and payment, in the free

<sup>4</sup> Cf. D. H. Truman, *Administrative Decentralization* (Chicago, 1941); Herman Finer, *English Local Government*, 4th edition (London, 1949); C. D. H. Cole, *Regional and Local Government* (London, 1947); William Anderson and others, *State and Local Relationships* (Chicago, 1947); David Lilienthal, *T.V.A.* (New York, 1944).

## THE CIVIL SERVICE IN THE MODERN STATE

operation of economic enterprise. Price—the index of efficiency and value—is quantitative. Solvency is a sensitive and automatic indicator of past success and a regulator of future enterprise. It automatically decides where, when, how, and how much, goods and services shall be produced.

In the services performed by the state there is no such index. The reasons for the provision of the services regularly transcend individual judgment; that is why the state performs them. The funds for operating them are not acquired voluntarily in direct proportion to the service immediately rendered, but compulsorily from the general revenue of the country on a broad judgment of how much it is desirable to spend, a judgment made by the representatives of the people and their technical advisers. The measurement of the value of state services is made by institutions, like legislatures, which may appropriate a sum to be spent in a certain time, but have not so far been able to make every dollar as certainly obtain its full utility as do some private industries.<sup>5</sup> The distance between the consumer and the producer is occupied by intermediaries—the parties, the legislatures, the cabinets, the civil service organization itself—which weaken the full force of consumers' demand, even of the consumers' need. Mistakes can be recouped out of the revenue, and explained (as we have shown, p. 528 ff in a previous chapter on legislative control of the executive) without the certainty of timely, informed, or decisive criticism. Where can a measure be found of the desirability of a reduction of the death rate? At what point should the interests of "future generations" be preferred to those of the present? How much is "France's prestige abroad" really worth? Did the direct and indirect results of the attempt to enforce Prohibition in the

United States merit the expenditure of human and material resources thereon? How much would it be worth the while of Frenchmen to improve their public hygiene? Would it be worth while establishing a total system of social security? What would the postal revenues amount to, if it were not for the social need of serving rural districts at a price much lower than the cost of the services, and how far ought such a burden to be borne? Between the minimum and the maximum answer to those questions a hundred graduations are possible; and in the upshot, the representative assembly makes only one of them effective. We have already seen the conditions under which such decisions are made; they are makeshifts, large, immobile, inflexible, and but inexactly responsive to the desires of the people or their legislative representatives.

Since the assemblies work under such conditions, it is clear that the everyday control exercised over the executants of the policy thus paid for is not likely to be either exact in relation to policy or purchased at the lowest possible price. For the inability exactly to measure attainment by the ultimate employer, the people, or the immediate one, the representative members and ministers, has its effect all through the ranks of the civil service, operating primarily through all those who are in managerial positions, whether they are the higher administrative officials or the foremen in workshops. It depends upon these whether the necessary discipline is exerted upon the executive and manipulative workers who are the ultimate units in the execution of state projects. Up to a certain point they bear financial responsibility to no one, for their financial responsibility cannot be accurately measured; and within the margin of uncertainty or inexactness, they may be inefficient at the expense of the taxes. Within that margin there may, of course, operate other incentives which secure a return for money much greater than what is given in private enterprise, and the strength and potentiality of those incentives will be the subject of later discussion. But whether they are operating

<sup>5</sup> The total utility of state activity may be much greater than the utility of all private activity together, because its largeness of scale and its own general authority produce economies which even the stupidest administration cannot entirely destroy.

or not is measurable, so far, only very roughly.

No accurate way has yet been invented of assaying the relationship between the output of the state and its revenue. We have already, in previous chapters, examined in detail the instruments by which the work of the civil service has hitherto been measured: the parliamentary investigations, the inquiries of committees and commissions, the informal deputations from interested groups; the formal and permanent representation of interests in the government departments; and the Treasuries and Ministries of Finance. The instruments of criticism move towards precision, and tend to rate ever more accurately. Yet a certain sternness and persistence is absent in the spirit and methods with which this purpose is pursued. For the result does not immediately affect each individual member's comfort and solvency, as such an examination does affect that of each individual consumer and producer. The ultimate loss of the former is, perhaps, some votes: that of the latter is certainly of welfare which could have been obtained without extra effort had the judgment been sound and the inquiry vigorous. The former cannot rate values so exactly as the latter because his tests—the electoral, the representative assembly tests—are linguistic<sup>6</sup> or polemical tests, in spite of recent improvements in parliamentary technique, while the test of the latter is one of hard cash.

Not that the politician's test may not sometimes be applied more fervently and call out all his talents and hopes, or that the civil servant may not love and know his work so much better than any man working for a personal money profit, but the question now is not so much one of incentive, as the ability to measure the extent of satisfaction or dissatisfaction, i.e., economic calculability. Further, as we shall show later (Chap. 34), the bodies set up to supervise and control the civil ser-

vice cannot possibly do so with exactness—there are too many immeasurables—and this results again in the inability to rate the value of one servant's work against another's—neither pressure nor standard is sharp.

In smallish enterprises it is almost possible to break down the financial results and penetrate to the department or the person responsible for success and failure. The price is a kind of continuous referendum; the employee voted down is supposed to be beaten out of his job or his business. This is not borne out in actual practice, but it is a useful myth and criterion.<sup>7</sup> No such external, competitive, and exact criterion of consumer preferences is applicable to public services: at any rate not over the whole field. Thus public officials are absolved from exact, external determinants of efficiency. Other determinants, and disciplines, and productivity investigations are required to keep the services fresh, wholesome, hard-working, and responsive to the consumer. If we cannot be sure that a system of external control and solvency will bring about the production of desirable results, then the nature of our desirable results must immediately determine the qualities we look for in the men admitted to the service. It is of the highest importance that only the fittest shall be selected and promoted, and that the conditions of discipline, reward, social status, and civic rights shall foster clever and zealous activity.

*Equality of Treatment.* We have already observed that public administration does not exist to make a profit, but to render services wherever they are most urgently needed. Inevitably the principle of equality imposes its demands upon officials: they must be fair, they must favor no one above another, and are only to be guided by the equal application of the law. In France and Germany the principle is actually declared. The Weimar constitution said,<sup>8</sup> "All Germans are

<sup>6</sup> R. H. Hawtrey uses this term in *The Economic Problem* (London, 1925), p. 348, but in another sense; I think that having regard to the controversial nature of government, "polemical" is nearer the truth.

<sup>7</sup> Cf. the extreme advocate, Ludwig Von Mises, *Bureaucracy* (Yale, 1944), and contradiction by B. Wootton, *Plan or No Plan* (London, 1938).

<sup>8</sup> Article 109.

... Public privileges or disadvantages of birth or rank are to be abolished." In France the jurisprudence of the *Conseil d'État* is thus summed up in Jèze<sup>9</sup>: "All individuals fulfilling certain conditions, fixed in a general and impersonal manner by the organic law of the service (law, rules, general instructions) have the legal power of demanding the service which is the object of the public service: this is the principle of the equality of individuals in relation to public administration." The Bank of England charter under nationalization requires the governors to be "equal and indifferent to all manner of persons."

These principles exclude partiality: do they exclude adaptability? They do not in theory, but they tend to in practice. As state activity increases, this principle of fundamental equality with appropriate difference becomes of more and more importance in the relationships of public and service. It excludes differences of treatment which are liable to creep in, such as political antagonism, sex preferences, and religious and class differences, but the very serviceability of official action requires that there shall be differences of treatment according to the nature of the time, place, and person.

*Limited Enterprise.* Public officials are officials; they are not politicians or statesmen; they are not legislators. They may be and should be advisers, and must be executives. But their enterprise is not their own to decide upon. They cannot take the liberties or property of the citizen at their free discretion, offering him in return certain services or goods as a businessman does. They operate within the minimum and maximum permissions stated in the statutes. Admittedly and necessarily the statutes give them some discretion, always under the safeguard, however, of political executive direction and control, and of legislative and judicial remedies. The faults of officials are therefore frequently the faults of the laws,

not of themselves. Sometimes they suffer from the frustrations of eager men limited by what they regard as irrational blinkers on useful activities and ideas. But just as the private entrepreneur will not be rewarded for the services he is not asked to produce, and may think how silly his customer is, so the civil servant is obliged to administer the laws which do not permit him to supply what he personally likes. If he did otherwise, the cry of "despotism"<sup>10</sup> would rightly arise. The effect on the mentality of the service is discouraging: that in private industry continuously encouraging.

*Public Accountability.* Democratic systems of government have established devices to keep the public servant accountable, or responsible, to the representatives of the people. How necessary these devices are can be appreciated from some of the observations already made regarding the monopoly and largescale nature of the services. They live, as one observer has remarked, in a goldfish bowl;<sup>11</sup> their every activity is liable to Peeping Toms, and the Peeping Toms can punish them. This cannot but inject in them an appreciable caution, a determination not to make mistakes. They will insist on records and files, will carefully consider the law before a decision is reached, and even then will hedge. Accountability makes for hierarchy and subordination, as the top men try to avoid involvement in responsibility by subordinates. It tends to dampen the independence of mind and contribution which the younger men in the department may make to policy building, for the chief will accept only what he can defend. Resolute attempts therefore must be made to institute deliberately counterhabits to the tremors and rigors induced by the peering eye and the prodding finger. A story is told of the United States Department of Agriculture in the New Deal days. A public-spirited new arrival in the department thought how useful it would be if he

<sup>9</sup> *Les Principes Généraux de Droit Administratif*, 3rd edition (Paris, 1925-30), Vol. III, p. 20.

<sup>10</sup> Cf. Lord Hewart, *The New Despotism* (London, 1928); and James Beck, *Our Wonderland of Bureaucracy* (New York, 1932).

<sup>11</sup> J. Juran, *Bureaucracy* (New York, 1944).

could transfer the income from one activity to expenditure on a fresh activity. When the department's legal adviser was asked what possible objection there could be to this good idea (and note that he was asked), his answer over his oldfashioned pince-nez was, "They cut off King Charles' head for that!" But in dictatorial states, also, the head looks upward to the dictator or falls off. Hence a congenital tendency to "red tape," *paperasserie*, and *Vielschreiberei*, and a special fear of rashness.

*"Establishment" or Hierarchy.* The rather inflexible determination of the scope and nature of state activity by the executive and legislature, and the impossibility of prompt and frequent resilience, result in the conception and practice of an "establishment," that is, a carefully graded hierarchy and number of posts with duties and salaries to match. This is not normally alterable or escapable, so that civil servants affected by the public atmosphere of free and developing industry which surrounds them, and faced with an almost certain prospect of no exceptional changes in their favor, become very sensitive about promotions, and their morale can become pathologically affected unless special attention is paid to the equity of the promotion system.

*Grading of Its Members.* Both the impossibility of accurate money measurement of the civil servant's output, and the ultimate impossibility of legislative control of finance unless based upon a few simple, unchanging standards, impel to the creation of grades or classes of servants. Legislative control would be quite impossible if every head of a department had the right to bargain with each servant on an independent basis; this may cause great unfairness as between one kind of duty and another.

*Directness of Government.* Since the civil service is concerned with the direct execution of government in relation to the citizens, and since it is immediately compelling, it is naturally disliked. All groups feel that their burdens in the state are more significant than their gratifications from membership of it. That

is a universal tendency of human nature. The bearer of ill tidings, moreover, is not seldom personally blamed for the disaster. There must always seem to be too many civil servants: they must always appear to be officious and hard of heart: and the benefits which they have to bestow must always seem to be slowly and grudgingly given. There are few citizens, indeed, who can see into and beyond the action of an official, and detect the ultimate groups and interests upon whose behalf he is, in the last resort, acting in any particular instance. Public officials are too often blamed for the law and the policy made by the legislative or executive, when the latter are really at fault.

*Lack of Ruthlessness.* The services do not act primarily to make a profit. They are largely philanthropic. Many services were assumed by the state on philanthropic grounds, and, in recent years, to improve the condition of the worker pained by the insecurity of his economic lot. Ruthlessness is banished, because it is believed that the state ought to be a "model" employer, and further, the "established" nature of the service tends to exclude personal competition. Hence, "once in the service, always in the service." Neither colleagues nor superiors care to speak with harsh judgment of each other or subordinates, personal reports are frankly discriminatory, disciplinary power is seldom employed, and dismissal as a penalty is exceedingly rare. It becomes a special concern, then, to discover the conditions of restful, inventive work, *within* these limits.

*Anonymity and Impartiality.* The modern system of ministerial responsibility and of changing political executives unequivocally demands that civil servants shall do their work without personal public blame or praise for policy, and that they shall act with impartial, but enterprising and unrelaxing, helpfulness to governments of any party complexion. This demand involves certain rules and standards of conduct to be obeyed by both ministers and civil servants, and especially affects the methods of recruitment, the political and economic rights

## THE CIVIL SERVICE IN THE MODERN STATE

of civil servants (such as candidatures and the right of association), and concerns, too, the methods of redressing their grievances. These problems will be discussed later in Chapters 34 and 35.

### THE MEASURE OF THE VALUE OF ADMINISTRATION

It is urgent in the highest degree that administration be neither overvalued nor undervalued. In order that a sense of proportion may be kept, it is important to realize that the word "administration" covers a multitude of jobs. They may be purely technical, in the natural-science sense of the word, or statistical, or instrumental (like blue-print drafting) or they may merely involve the statement of the relevance of a legal clause or decision. Some men who call themselves "administrators" and describe their profession as "administrative" are hardly more than clerical or arithmetical instruments. Yet so also included in the category "administrative" is the highest departmental adviser to the political chief of a great department of the government.

Now a large mistake in the smallest and most common of functions could have disastrous consequences for the state. The decision in the United States War Department by a fairly minor official to send the telegram of warning on December 5, 1941, to Pearl Harbor *via* commercial telegraph determined that the message should never reach its addressees in time. Yet all in all, we may, like Macaulay in the mid-nineteenth century,<sup>12</sup> talk of two general planes of administration: the intellectual and the routine, or, in modern terms, high-staff advice and management as contrasted with routine operations.<sup>13</sup> The welfare of the state depends normally far more on the former than the latter, since it contributes a significant ingredient of policy as well as helping to its practical fulfillment: it makes and gives orders

from the pinnacle. Even so, it is still no more than auxiliary to the politically chosen chiefs of the government. The political chiefs make the policy, and all the rest, staff and line,<sup>14</sup> are subordinate in authority and decision.

We have already had ample occasion to appreciate the important, the incalculable services rendered by the highest officials to the political executive and the legislatures, but they are far from being the masters of their nation's destiny. Whether they are in the higher positions, or *a fortiori* in the lower, it has always seemed to me (since I sat in the central councils of the TVA for a whole year and acted as consultant for two years to the ILO) that the "administrator" may make no more than, say, a difference of ten per cent (if that) to the efficiency of the government as a whole for good or ill. Policy rules or ruins, not administration. Policy kills or quickens, not the general manager or the budget officer or the personnel director. The administrator can scarcely ever be so brilliant and devoted that governmental action becomes over ten per cent more economical or efficient than a poor to average man would attain. On the other hand, if the administrative services fell to a point of inefficiency more than ten per cent below what the public and the legislature might reasonably expect, then all the organs of public opinion would be scandalized. The ten per cent would be the pathological administrative fever point, at which stage harsh medicines and purges would be applied. I am not wedded to ten per cent. The magnitude is set down to indicate that some such criterion is the proper symbol of the value of administration in government. We must not overrate it, lest our attention be diverted from the sovereign field of policy, of function, of objective, and of the problems involved in their proper formation. Yet ten per cent is not to be disprized. If clever, loyal, constant administration added ten per cent to the national efficiency, so far as government

<sup>12</sup> Cf. p. 762 below.

<sup>14</sup> Cf. A. W. Macmahon, J. D. Millett, and G. Ogden, *Federal Work Relief* (Chicago, 1941).

## THE TEMPERING OF BUREAUCRACY

can add to it, the value would be equal to the discovery and use of some new invention or some new mineral resource that would raise the standard of living of a whole people.

The criterion of cost must always be applied in considering governmental efficiency at the administrative level. Now only a fool would withhold his tremendous admiration at the truly breathtaking miracles of administration performed by the United States government on the way to victory in World War II. Yet, without cost, we have no criterion if we are interested in the value of administration and the lessons of victory. Doctors bury their mistakes, but must victory bury hers? The alternative cost must be borne in mind in weighing the significance of true general judgments like the following by a very talented theorist and practitioner:<sup>15</sup>

It is easy to point to individual blunders, the need for a true "war cabinet" with a secretariat, and the "failure of the system of anonymous Administrative Assistants," but no one can question the extraordinary total effectiveness of the Presidency under the administrative system which we had through the war years. Perhaps it was luck, perhaps it was Divine Lend-Lease to the USA, perhaps it was "that Man in the White House"—perhaps the organizational system had something to do with it too. But whatever it was, the American constitutional system *in time of war*, and particularly the Presidency, will long receive the acclaim of historians and statesmen both here and abroad.

### THE TEMPERING OF BUREAUCRACY

SINCE, therefore, certain necessary potential consequences of the organization and status of public services are undesirable, the statesman is obliged to invent anticipatory remedies. If the quality of the administrative product cannot be guaranteed by the whip of competition and price, then we are compelled to rely on the personal qualities which produce efficiency and productivity. The sum of pro-

ductive qualities, when assured and cultivated, should add up to efficiency to the consumer. Hence the intense preoccupation of students with recruitment methods, training before and after recruitment, the moral as well as the intellectual qualities to be cultivated, and the whole range of subsequent moral and material incentives, inducements, and controls.

Now, part of the inducement to enter the public service is a sense of service: that is, the consideration that of the many calls which a man may have on his life as he surrenders his years and faculties with the passage of time, this above all has value and justification. It is clear that such a sense of service depends tremendously on the general values of the civilization he lives in. These values are determined by the history of his country; the religion it effectively practices every day, and even the one that is professed; the state of the alternative professions and occupations; even how much money he supposes the pretty girl he wants to marry will expect him to bring home. It depends upon how the possible recruit has been taught to use his leisure. I have no formula which will cover the different amalgams of material and spiritual aspiration of the different countries this volume studies. But that what is holy in one country is the object of contempt and jeering in another is a fact, and social value and prestige affect the degree to which the best brains and the best characters are prepared to serve the community, at home and abroad, through the conscience and will of the whole society, as they operate through the organization called the state.

This, however, leads to an observation on the malicious and interested attacks on public officials, expressed in the invective of "bureaucracy." The cry is particularly shrill in election years. Its real target is most often the purpose of the law but it hits the official who administers it. The maligner makes no distinctions. His cry is sometimes aimed against the true infirmities of officialdom like the abuse of powers suggested above, even of

<sup>15</sup> Luther Gulick, *Administrative Reflections from World War II* (University of Alabama, 1948), p. 77.

## THE CIVIL SERVICE IN THE MODERN STATE

*misdirected zeal. Authority causes some men to grow, but others only to swell. Bureaucracy is not public officialdom; it is the infirmities of a profession, for which well-known practicable prophylactics and remedies exist.*

The problem of bureaucracy is not a problem of the public offices alone. It involves the three elements in the state: the bureaus, the legislature, and the public. Each has its indispensable contribution to make, and the fulfillment of it by any two can be frustrated by the default of the third. The legislature owes, above all, careful drafting of the laws so that responsibility may be clear and tasks defined. It owes a twentieth-century rationalization of its machinery and methods, so that it may survey—amply, patiently, and thoughtfully—the work of millions of public producers. And, supremely, it owes to the nation the deep sincere obligation of treating public servants as average business men and women working for their living in the business of the public. This implies that partisan injustice and spiteful sneers be restrained, and that the legislature conduct its necessary and desirable investigations not as operations of torment or as self-righteous exhibitions of hatred and contempt or as invitations to the public to spit upon alleged sensational scandals. It is easy in a democracy to get the public to laugh away its political assets, and someone is always ready to cheer the iconoclast. If the members of the legislature make a goat of public officials, they cut off democracy's right hand. An awful responsibility is incumbent on parliamentary institutions in this, the twentieth century.

Finally, the public has its duties. It must recognize that the consumer is sometimes wrong. It need not condone inefficiency; it ought to make complaints. But it owes a self-control over spite and derision and it ought to hear both sides. It should not permit its legislators to cry out, "Good hunting!" whenever they see a civil servant. To hate government is infantile, for government is necessary. And what is necessary should be suffi-

ciently respected to encourage the invention and application of improvements. It should never be forgotten that a vast part of modern private enterprise has—either by deliberate collusion or by the manifest benefits of large-scale organization—come under single managements, which, because they lack competition and are of great size, have succumbed to the diseases we know as "bureaucracy."<sup>16</sup>

Finally, the supreme importance of recruiting and retaining persons stands out like a beacon in the efficiency of the public service. If the right people are obtained, they are able to know and do all the things that otherwise cumbersome procedures must be invoked to do. Such are decentralization; correct division of the work among departments and divisions and subdivisions;<sup>17</sup> proper marshaling and leadership of the technical forces; useful application of advisory and research committees; and then, as level upon level rises to the final political governors in the executive and the legislature, coordination of the persons and authorities necessary to advance stage by stage in reasonable progress. These divisions of function come about because a single human being is unable to do everything all the time: as the technical jargon goes, his "span of control" is limited.<sup>18</sup> The distribution of responsibilities occurs in order not to overload any single official with more than science teaches us he can bear. But then, again, for wise policy and effective action the parts must again be brought together, once more because of the limitations of the individual: he sees his own job intensively and his eyes get glued properly, thereto. Yet something must transcend the pieces that compose the jigsaw puzzle of state. Or-

<sup>16</sup> This much is well demonstrated in Professor Marshall Dimock's monograph on *Bureaucracy and Trusteeship in Large Corporations* (Temporary National Economic Committee Monograph, U.S. Government Printing Office, 1938).

<sup>17</sup> Cf. Schuyler Wallace, *Federal Departmentalization* (New York, 1941).

<sup>18</sup> Cf. *ibid.*, and L. Urwick and Luther Gulick, *op. cit.*

## THE TEMPERING OF BUREAUCRACY

ganization does this but again, organization is worked by human minds. The personnel problem then is sovereign. Inferior men and women can defeat the finest departmentalization, whether at the center, whether between the center and the localities, whether in the form of release of powers to quasi-subordinate functional bodies. Personnel is sovereign. If men and women are competent enough, they can give life even to inexact, confused, and rough-hewn demarcations. Personnel is the sovereign factor in public administration. Will and mind are first; they engender policy; and mechanism is subsidiary to function.

In the coming chapters, accordingly, attention is confined to personnel problems; and within that focus is another, namely, concern for the top manage-

ment, or administrative, groups. Apart from considerations of scope, the reason for this is the supreme importance of the advisory and directing function at the summit. But also, the broad masses of the service offer fewer tough "public" problems, seeing that they perform either the average jobs of the service or the highly specialist ones. The tempo and morale and creativeness of these is either unamenable to any very considerable improvement by managerial tactics, while the specialism carries with it qualities of morale and professional standards which are at once definable, examinable, and controllable, whether top management is good, bad, or indifferent. The problem here is chiefly how to release upwards by promotion those of exceptional talent into the administrative class at the apex.

## *Origins and General Character: Germany*

WE now seek to deepen our understanding of administrative problems by reviewing in broad outline the administrative experience of a number of countries. Each country has its own history, each its own direction and pace in the course of the last three centuries, and therefore each regards modern questions from a different point of view and asks them out of a different experience.

The country with the longest serious study and experience of a civil service and its problems is Germany. What I have to say here is the common heritage of Germany, but in the main it refers more exactly to the history of Prussia. The character of that influence is known to all the world as "bureaucracy." This was more the outcome of historical accidents than inborn temper, and now that it is challenged by the sovereign popular assemblies, it is likely to change its nature within a generation or two. No biological feature stamps Prussia as inevitably bureaucratic, but merely an accident of organization in the past, remediable perhaps in the future. Ancient purposes compelled her to forge bureaucratic instruments. The political error was not that such instruments were ever used, but that they were retained after their primary purposes had been accomplished.

If, from an early date, the German civil services were bureaucratic, they were also regarded as professions conferring great honor upon those who followed them. Indeed, in every state the civil ser-

vice was the most honored profession, though in some, like Prussia, the higher military services were considered slightly superior. It was not snobbery that set this standard, but service and the expectation of service to prince and people. At a time (1723) when England and America in this respect were barbarian, and France profligate, rules of training and recruitment were formulated in Prussia which successfully provided efficient staffs. Indeed, it is plain that energies as mighty as those which England devoted to the creation of parliamentary institutions were in Prussia turned to the establishment of administrative institutions. While England was founding the constitutional state by the bloody struggles between the Stuarts and Parliamentarians, Frederick William, the Great Elector of Brandenburg, in struggles as bloody, consolidated his state, uprooted the remnants of feudal administration, and created the administrative organization indispensable to an efficient absolute monarchy. In 1688 when the Great Elector died, his legacy was an army and a civil service; in 1688 when William of Orange ascended the English throne, the English reward of a half-century's efforts was a sovereign Parliament. Thenceforward the cleverest young men in England passed (or did not pass) from the universities to the political parties and the House of Commons, while the clever young German, whether a Bavarian, Prussian, Hanoverian or Saxon, passed through grade after grade of ac-

## EARLY HISTORY

tual and diverse administrative service, to become a statesman. Each system has its advantages and disadvantages, and each its philosophies. Political science in England maintained the turn it had taken prior to and during the Parliamentary struggle: it concerned itself principally with the question of political liberty and obligation. In Germany, cameralism, or the art and science of government by administrative departments (*Kammer*), attracted the best minds of the seventeenth and eighteenth centuries.

### EARLY HISTORY

*Recruitment.* In Germany attention was early turned towards the problem of recruitment. This is, of course, the vital problem of the civil service. All depends upon the quality of the servants, and this is, to a large extent, governed by the terms of recruitment. Necessity and chance, as in all growth, had a large share in directing earnest attention to recruitment. The earliest formally qualified civil servants were the so-called "hired Doctors" (*gemietete Doktoren*) of the late fifteenth century. They were councilors forming part of the permanent or occasional entourage of the prince, and learned in the law.<sup>1</sup> There was, of course, no systematic organization of recruitment; the doctors of the law were engaged as they were needed, for the business of the rudimentary state did not require continuous services: in that it differs vitally from the modern state. The majority of the court officials who constituted the civil service of the time were men of high ecclesiastical status and of the nobility. These learned councilors were usually in the employ of more than one court. It is interesting to notice that with the institution of "hired doctors" there was introduced in Germany that connection between the civil service and legal training which is characteristic

of that country, and which has fallen in the course of time from being its highest glory to being, perhaps, its gravest defect.

In the next century, the full social and political force of the New Learning began to be felt and the reign of great states was beginning. The universities began to exert a vivifying effect upon intellectual life, and the state to develop from the private "estate" of the prince—the *seigneur*—into a more public thing. One set of officials acting in the localities in the service of the prince were concerned with military, police, and miscellaneous duties, including supervision of the municipalities; a second set were specially occupied with financial affairs; and a third conducted the administration of police, though, in the primitive division of powers, this included many things which we should today call administration. These central officials who, in Bavaria and other states, acted locally, were a powerful instrument of centralization owing to their education, which made them the frequent arbiters in disputes between powerful men, town, guild, and estate councils. Most of these officials were nobles, but in proportion as learning was required for the execution of their duties and as legally trained *bourgeois* became available and tended to be preferred by the antifeudal centralizing princes, the nobles were gradually forced to acquire a modicum of skill, either by formal instruction at the universities or by making the Grand Tour (*Kavalirtour*). The nobles lost ground rapidly in the two official categories where reading, writing, arithmetic, and legal skill were required: that is, in the financial and the judicial offices. For the office of defense and maintenance of the peace the non-learned, warlike noble was sufficient unto the time. At this date two troubles afflicted Germany which required more than a subsequent century of effort to eradicate. The large estate owners were made the royal officers and they were paid, as most officials then were, not in money, but in kind, the produce of the royal domains. The economic interest of these estate-owning officials tended to overcome their principles of

<sup>1</sup> Cf. S. Isaacsohn, *Geschichte des Preussischen Beamtentums* (Berlin, 1874), Vol. I; A. Lotz, *Geschichte des Deutschen Beamtentums* (Berlin, 1909), pp. 33 et seq.; C. Bornhak, *Geschichte des Preussischen Verwaltungsrechts* (Berlin, 1885), 3 vols.

good administration, and it became necessary to separate the economic management thereof. At the same time, the actual property of the noble was by no means completely under the direct government of the royal authority. A second danger threatened: one, indeed, which we shall show later (p. 750), entirely demoralized French public administration for two critically important centuries: the sale of offices and the alienation of jurisdiction. Under this system the office became, in the rudimentary condition of financial administration of the time, an easy means of producing revenue. A great deal of the State's field of administration was delivered over to private proprietors and towns. But Germany was energetic enough to purge herself (not entirely) of hereditary jurisdiction and sinecurists by 1700, while France succumbed.

*The Reception of Roman Law.* From the beginning of the sixteenth century, Roman law exerted a powerful influence upon the civilization of the Continent.<sup>2</sup> It taught the absolute authority of the *princeps*. The authority and the justice of the latter were pitted against those of the estates and localities, and caused the growth of a large popular literature of legal handbooks. The reception of Roman law, which took place over a period of two and a half centuries, can be said to have reached its completeness about 1550. The uncoded, largely unwritten and uncertain law of the Germanic states, varying from place to place and from court to court, and hardly deserving the name of application, since the subjective feeling of justice of the judges was paramount and unconnected with general principles, gave way gradually to a unified, crystallized, codified set of legal principles, the logic of which decided the fate of any particular case. The courts of law and administrative positions were opened only

to schooled lawyers.<sup>3</sup> There began that close and continuous and fruitful connection between the universities and the civil service which has not yet ceased and which other countries began to organize only about three centuries after this time.

At the same time, officialdom was influenced by the new conditions of commerce and law in other important directions. The councils of the prince received a more permanent and systematic organization than before, and both sessions and the division of work became more regular. The learned officials began to be paid in money and their contracts with the prince provided for their tenure and superannuation. To their character of mere servants of the prince's person they added that of servants of the public, for in the fiscal and other arrangements they made with the estates, the prince's opponents, they had to render justice not only as between prince and estates, but as between the various branches of the estates. The official councils became the resort of those who sought prompter justice than the occasional circuits of the courts could give, and by the end of the sixteenth century such official councils to advise the prince were accepted,<sup>4</sup> and were by the estates demanded, as indispensable to good princely government. Their cosmopolitan learning, their wide experience, and their conceptions of sovereignty made their temper anti-estate and anti-local. Since they were schooled, they could be turned to a variety of jobs, and in the consequent notation they learned the art of administration. Their centralizing spirit earned them the hatred of the estates, for, following the deliberate policy of the princes, they were frequently not natives of the state, but foreign-born, since these were more likely to side with their master than with the estates. Officials of the kind we nowadays call subordinate, or in Germany *subaltern*, were drawn from the middle class, obtained experience in town administration, and had a grammar-school education. They sometimes reached

<sup>2</sup> See Stintzing, *Geschichte der Deutschen Rechtswissenschaft, Erste Abteilung*, pp. 21 et seq.; W. A. Holdsworth, *History of English Law*, 2nd edition (London 1922-38), Vol. IV; Stölzel, *Brandenburg-Preussens Rechtsverwaltung und Rechtsverfassung* (Berlin, 1888), Vol. I, "Erster Teil."

<sup>3</sup> Stintzing, *op. cit.*, p. 52 et seq.

<sup>4</sup> Cf. Lotz, *op. cit.*, p. 58.

the highest offices. The usages of the time included the receipt of presents as well as fees.

*The Seventeenth Century.* It is in the seventeenth century that we can better see the growth of the modern state exerting its inevitable influence upon the civil service. The civil service was the royal answer to feudal pretensions and local patriotism. As loyalties and services were withdrawn from their feudal and local possessors, they were transferred to the centralized civil service. Broadly, they combined almost complete centralization with careful, deliberate, and clever organization of the various central councils. A central financial and budgetary system, a privy council for high politics, and a central and supreme judicial court were set up. The administrative center of gravity was the Exchequer (*Hofkammer*). The Exchequers then laid down financial policy and drew up financial legislation; they were the controlling authority for the royal domains, an appreciable source of wealth and power in a day when states were small. They collected the state revenue and administered its debts. They fostered handicrafts and trades and markets, planned tariffs, and were the personnel authority. The Exchequer became the central point of the economic system, for state activity was then not characterized as "interference": it seemed to be the expected and natural process. The Reformation threw further duties upon the state: *viz.*, education and poor-relief.

#### THE RISE OF THE PRUSSIAN CIVIL SERVICE

PRUSSIA now commenced to develop rapidly until it became the foremost state in Germany, and an example to the rest. Its exemplary and brilliant progress was largely due to the same kind of accident which in France led to deplorable results—the accident of birth. Between 1640 and late in the eighteenth century—let us say until the French Revolution—Prussia had the fortune to be ruled by four kings of whom three had administrative genius of a high order: these three, the Great Elector, Frederick William of Brandenburg

(1640–88), Frederick William I (1713–40), and Frederick the Great (1740–86), reigned in all for about 110 years.

*The General Course of Development.* It is almost impossible to appraise sufficiently the importance of these years of intensely energetic administrative drive. This directing force came at just that epoch in the life of the state when it was most urgently needed: that is, when all the spiritual and economic interests of men demanded a medium for their realization which the towns, counties, duchies, and other small and separatist areas of government no longer adequately afforded.<sup>5</sup> It came at a time, too, when its results in terms of administrative organization were bound to have an influence stretching as far as the institutions and mind of the nineteenth century. The Thirty Years' War caused tremendous material, spiritual, and institutional damage, and it threw upon the survivors the burden of reorganization of at least the revenue and military system. The state was extended in territory and population, and thus the number of civil servants within a single organization increased. It increased, too, because there was ascribed a field of activity to the state not again equaled till recent years. The sovereignty and *jus eminens* of the princes, which now obtained an absolute form and suffered decreasingly from challenge, was linked with the positive character of the state. A new technique was demanded, for the contemporary economic processes and morality required promptitude in judgment, honesty and energy in administration, intellectual equipment of the civil servants, and a reform of the old councils and chancelleries. The economic-cum-administrative science of cameralism began, and it taught the importance of a trained civil service.

Prussia was given a great impetus "to strengthen the civil service as the concrete means of unity, as the chief organ of state

<sup>5</sup> This is, perhaps, most brilliantly described in G. von Schmoller's famous essay, "Das Merkantilssystem," in *Umriss und Unterscheidung* (Leipzig, 1898).

unity."<sup>6</sup> The Great Elector considered the Privy Council and himself as the unifying and supreme authority over all affairs of state. The character of the Privy Council had changed from that of an advisory to an executive organ. Some of the chiefs of the various departments were appointed members of the Privy Council so that they brought special knowledge to bear upon the discussions and, further, knew exactly how far their department was called upon to execute the decisions. There was a continual process of accumulation of business in the hands of the state and a continual creation of special organs to deal with it.

The whole country was the better brought under the control of the central authority by the institution of the *Statthalter*, a local regent appointed by the prince. They were non-natives of their particular province, and, being appointed members of the Privy Council at Berlin, they constituted a bond of union between the center and the localities, making of the resolutions of the Council a local reality. The *Statthalter* was important till the end of the seventeenth century, when the opposition of the estates and the provinces to central domination having ceased, they became unnecessary in their crude early form. Few were natives of the district in which they served, for in accordance with the nature of the state of the time, not the least important quality of a civil servant was his impeccable loyalty to the central authority. The civil servant was first the outpost of royal power; other qualities were essential, but only after this.

This twofold aim of centralization and militarization accompanied another which we nowadays describe as paternalism. In the actual experience of the Prussian state, however, it was found easier to realize the aims of the first two, but not so easy to create a civil service which should produce good fruits from the third. For centralization and militarization are inimical to paternalism: the former is only rarely

its appropriate tool, while the latter is its competitor and consumes its substance. Until the end of the eighteenth century, paternalism continued to be a faithful expression of the state, along with centralization and militarization. But the tendency was for it to lose its value compared with the others, and centralization and militarization became the predominant characteristics of the Prussian civil service. Forms predominated over purpose; command over the substance of commands; hierarchy over collegueship; discipline over free creation; routine over local and personal invention; and at the end of Frederick the Great's reign, the charge of "bureaucracy" begins, not to end even in our own day.

*The War Commissariat and the Chambers.* We have anticipated the results of development. Let us retrace our steps. In the middle of the seventeenth century, the armies were nationalized. Prussia created a standing army directly administered by the state; and the formerly mercenary officers, captains, men, equipment, and so on, became socialized. Naturally, the war commissars became permanent state administrative officials: they had their local areas and central department. The government became a recruiter, and since money economy was yet in a backward condition, it had to become a barracks and feeding agent. The localities were directly called upon not merely to pay taxes in money, but to supply billets, food for men and horses, stabling, arms, and clothes. This led to penetrating interference with the life of the citizens, caused interference with civic administration, with guild and market conditions, and not least, with the bane of the seventeenth century, inns and tippling houses.<sup>7</sup> When natural economy gave way to money economy, the war commissars were brought into direct contact with the taxation system of the country. From 1680 onwards, the war commissars stood in the very front and center of public administration. They were obliged to take into consideration everything that could increase the ca-

<sup>6</sup> G. von Schmoller, "Der Deutsche Beamtenstaat in 17 und 18 Jahrhundert," in *ibid.*

<sup>7</sup> Cf. *idem.*, p. 299.

capacity of the citizen to pay his contribution toward the maintenance of the army; taxation systems and reforms, the excise which would be increased by greater production, the general police measures which would free the people of material and moral defects, and social welfare institutions like the promotion of good agriculture and manufactures. They became tax officials and local police authorities and overcame the independent tax officials of the states, so that thenceforward the state predominated in this field through its own officials. The central director of war was created, the *Generalkriegskommissariat*, to exercise control and direction over the local commissariats—the best-hated branch of administration in the state, best hated, that is, by the estates and the cities, and Frederick William's testament acknowledged the difficulties of the situation. It was the soul of the new state. As one of the ablest of German administrative historians has said, "Prussia was then not a land with an army, but an army with a land."<sup>8</sup> In 1712 the *Generalkriegskommissariat*, which had split off from the Privy Council, was reorganized to cope with its accretion of duties: one of its divisions was devoted to taxes and excise, another to military affairs, and the third to administration and administrative jurisdiction. State power and civil equality were its pillars.

Meanwhile, from 1651 onward, the financial and economic divisions of the former local agents of the central authority, the *Amtkammern*, were given an independent status, and connected with a central division of the Privy Council. These local *Kammer*, and the central authority supervising them, had a field of activity comprising the contemporary equivalents of what is now the work of the British Treasury, Board of Trade, Inland Revenue Office, Ministry of Agriculture and Fisheries, and other economic administration scattered through the British government departments.

Both the war commissariats and the

chambers took away from the power of the old claimants—the governing bodies which represented the local and feudal authorities. These authorities had till recently possessed the power to judge the competence of the chambers wherever they were disputed, but gradually this power of judgment was withdrawn, and all matters relating to the *statum politicum et oeconomicum*<sup>9</sup> were transferred to the chambers and the commissariats themselves. Administrative departments had arrogated to themselves an extensive field of justice. It was secured that the state departments should decide the limits of sovereignty and private law. By a series of instructions between 1713 and 1725, chamber or administrative justice<sup>10</sup> was set in the ascendant until the reforms of 1808; but the extent to which it is maintained is still a point of distinction between Continental and Anglo-Saxon institutions. Its later development and significance is discussed in another chapter (Chap. 36).

*Centralization and the Civil Service.* The centralization of the country proceeded apace. As in contemporary England, there was no local government system in organic connection with the central authority: none which, made by the central authority or evolved from its own necessities, had formed an efficient association with the central government. The towns and other great estates ruled themselves. Voluntary administrators, called *Kreisdirektoren*, performed the tasks of local government in unions of estates, and they and their districts became the basis of the Elector's local government arrangements. The establishment of a standing army had led to the appointment of state commands for these districts, and, naturally, continuous negotiations between these and the *Kreis* authorities took place. It was not long before the work of the Commissars was transferred to *Kreisdirektoren*. But instead of being self-elected, they now came to be appointed by the Crown, and as the office grew in importance and

<sup>8</sup> Ernst von Meier, *Hannoversche Verfassungs- und Verwaltungsgeschichte, 1680-1866* (München 1898, 1899), Vol. II, p. 409.

<sup>9</sup> Lotz, *op. cit.*, p. 115.

<sup>10</sup> Cf. *Acta Borussiae* (edited by G. von Schmol-ler, O. Hintze, et al.), Vol. III, p. 68a ff.

required technical knowledge, they gradually became central professional officers under the direction and pay of the central authority. Thus a local authority was created which represented at the same time both the central authority and the local interests; that authority had come into being out of military necessities and for more than another century the military spirit pervaded its administrative activity; that activity naturally became extended over a very large number of economic and social activities; and it was a rural not an urban institution.

The towns were brought under the supervision of the central authority by the institution, in 1680 and following years, of tax commissioners to whom the municipal excise officials were obliged to account. At first they were traveling commissioners, making their circuits twice a year.<sup>11</sup> Soon their tasks were increased, for, as tax officials, the central authority required them to undertake various detective activities, for example, into the rate of payment for entry into citizenship, or the fees asked for admission into guilds. With the assistance of municipal magistrates, they became courts of justice in cases of tax frauds and insults to tax officials. They were made the inspectors of weights and measures; new taxes upon bakers and slaughterers were put under their management; and little by little they came to supervise the whole field of municipal administration, and to control the trades—guilds, building, and brewing. "By 1722 the Tax Commissioner had practically become the guardian of the town, which lost all independence."<sup>12</sup> He had under his control a host of medical men, and lesser officials like police and bailiffs, statisticians, and clerks. Tax collection ceased to be his primary business: his vocation became the control and supervision of the life of the municipality in the name and the interests and under the direction of the central authority. He was the clearest symbol, as he was the most

active agent, of the police state, the bureaucratic state on its paternalistic side. He combated local simony and nepotism. He was not, however, a wheel which turned independently of the other cogs set in movement by the energetic Hohenzollerns—he was a member of the war commissariats, where he exercised weighty authority. He had no judicial authority, but the commissariats had, and they judged the cases he brought before them. The tax commissioner's profession was the training ground for the best Prussian officials of the eighteenth century,<sup>13</sup> and they brought to their central departmental duties a fund of experience which explains why the Prussian state, incapable constitutionally of being reformed from outside or "below", could at decisive times be reformed from within or "above."

There was by now, in the first quarter of the eighteenth century, a civil service large for its time. Posts (nationalized in 1650), taxes, customs, forests, salts and mines administration, the schools and the church, in country and town—all demanded a large number of officials, capable officials, most of whom were recruited from subaltern army officers who had finished their service. The wakeful vigilance and grim earnestness which enabled the Hohenzollerns effectively to demand the efficiency and accountability of their presidents, ministers, and councilors was continued in the relations between these and their subordinates in the early days, at least, of these institutions, and with variations from chief to chief.

*Energy and System.* So far only the pioneer work had been done, great as that was. Men had been chosen for the state services of great capacity, occasionally of extraordinary talent, the field activity had been plotted out on an extensive scale, the enemies of the state suppressed, and a measure of competence and honesty introduced into the civil service. The organization, though so far approaching systematic form, was still loose and tentative, the authorities confused and

<sup>11</sup> Cf. G. von Schmoller, *Preussische Verfassungs-Verwaltungs und Finanzgeschichte* (Berlin, 1921), pp. 151-52.

<sup>12</sup> Lotz, *op. cit.*, p. 121.

<sup>13</sup> G. von Schmoller, *Deutscher Beamtenstaat*, p. 300.

overlapping. The new ruler added system, formulated the rules of recruitment for higher officials, purged (by no means entirely) the service of the dishonest, and infused it with a fresh energy.

The quality of this energy is more important than the institutions which were created, but we cannot omit the institutions, because they work upon mind and energy, now improving, now spoiling, what springs from inward source. Schmoller best describes Frederick William's character, and it was this which, to the extent of the possible, recreated the character of his officials. He entered upon his work with "modest, latherly economy, with Protestant conscientious morality, with sober rationalistic consideration, but also with the shrewd intensity and force of an unbendable will."<sup>14</sup>

The institutions energized by this intense spirit were ingeniously planned. In all the central departments the "collegiate" principle was thoroughly carried through, in order to avoid the predominance of any one man and to secure the benefits of collective wisdom and continuity of policy. Collective responsibility was enjoined. The councils were responsible, especially for accounts and for the probity and competence of their subaltern officials. The councilors were expected to create the means of narrowly watching all those at work in their department, and they were to make use of "spies" to inform themselves. Yet they were to examine with care the reports made by the spies lest the reports did an injustice to their subjects. Even the king himself had spies all over the country to report upon the conduct of ministers and officials.

Various instructions settled exactly the hours of work, procedure, and official secrecy. Employment outside the official service was prohibited, the acceptance of presents was prohibited, excise officials were forbidden to buy confiscated goods, and from those who handled money a guarantee was required. The officials who came into direct contact with the public were ordered to be polite, and the insult-

ing of merchants was punished with a fine for the first offence and with imprisonment for the second. The tax commissioners were ordered to keep personal records of the local officials. Residence in the neighborhood of the work was exacted, and the conditions of leave were rigidly regulated. For breaches of the regulations there was a series of heavy fines, which were imposed. A Spartan quality was introduced into the service. Perfect accounts were expected, and expenditure beyond the budget was charged against the official. The king now undertook the examination of estimates, and each was obliged to receive an assent. Along with these sources of information about the nature of his state, the ruler had regular reports at various times of the year from the various central and provincial authorities. The royal example operated downwards through all grades of the service, and the spirit of strict subordination, the forcible exaction of the last ounce of duty from those who were obliged to render it, became part and parcel of every member of the administration. Direct explosions of the royal wrath were feared, and there yawned always the gulf of delation by colleague-spies. The king's example compelled imitation even to the farthest corner of the kingdom.

*Provisions for Civil-Service Recruitment.* In this reign the first formal rules of recruitment were established; and, fundamentally, they have ruled the German state ever since.<sup>15</sup> Already in 1700 written and oral examinations had been prescribed for military judges and judicial councilors. By the judicial order of June, 1713, it was laid down that no subordinate judge was to be appointed and no advocate was to practice without passing the examination prescribed by the state. If there were several competitors for posts, the best candidates were to be accepted in order of merit. Soon after this the *Protonotarien*, the highest clerical officers and the secretaries of the law courts, were required to pass a written examination before appointment. All this, of

<sup>14</sup> *Deutscher Beamtenstaat*, p. 287.

<sup>15</sup> Cf. *Acta Borussica*, Vol. I, *passim*.

course, presupposed a thorough legal training at a university, and in 1723, such a training was expressly required, and at a native university, the University of Halle, about which we shall have something further to say a little later (p. 733). Aspirants to the service could be allowed to participate in the procedure of the courts, but without a vote, before taking their state examination. Thus began the system still adhered to in Germany of the *Gerichtsreferendar*: the aspirant to the judicial service, who takes his university examination, and is known as a *Referendar* while he undergoes a period of preparatory service, after which he takes the final state examination to become an *Assessor*, the first rung of the judicial service. In 1737, a minimum of legal knowledge was prescribed for all other officials, in whatever departments or institutions, who participated in the administration of justice. This affected the relationship between noble and citizen, to the general advantage of the latter, since even those who took part in the administration of justice in virtue of feudal survivals were now obliged to acquire their university diplomas.

The rules of recruitment for the higher administrative service were not prescribed until later. And it should be specially noticed that these differed materially from those applicable to the judicial service. Experience was at first considered a better preparation than any formal training that could be invented, for general administrative work. Apparently, this, which occupied itself directly with promoting the economic welfare of the country, was the king's favorite branch, for upon being asked by the general directory in 1723 whether a place could not be found for the son of a deceased chancellor, he answered: "Examine him to see whether he has sense and a good head; if he has, let him be employed in the Kurmark War-and-Domain Chamber; if, however, he is a fat-headed devil, make him a member of the Supreme Court of Cleves, he's good enough for that." <sup>18</sup> Yet considerations of

efficiency soon found their expression in a genuine though rough-and-ready procedure. The Instruction (of December 20, 1727) establishing the *Generaldirektorium* contained the general statement of qualifications: the presidents of the commissariats and chambers should have the same qualities as members of the general directory:

clever men as could be found anywhere, Evangelical, Reformist or Lutheran by religion, faithful and honest, with intelligent vision, possessing sound information about commerce, manufactures, and other cognate subjects, but also able with the pen: above all, they must be native subjects, but a foreigner of extraordinary ability can be suggested; they must be persons who are capable of anything for which one wishes to use them.

It was expected that the candidates should have taken courses at Halle, Frankfurt, or Königsberg in cameralism—that is, in administrative science—and in agriculture and forestry. The university diploma was a prerequisite, ordinarily, to office. Young men were brought into the service after such a preparation and were then employed, without pay, in the departments, so that they might acquire practical experience of administration before they were given a permanent situation.

Here, in these university candidates, we see the lineal ancestors of the modern *Regierungsreferendar*: the government or administrative aspirant, then called *Auskultator*. In 1748 the qualities and studies of the candidates for government service as *Auskultator* were laid down in an instruction:

They must have occupied for at least one year such a position as would have given them the opportunity to obtain a knowledge of agriculture, cattle breeding, brewing and brandy manufacture, as well as trading accounts and extracts, as well as the surveys and valuations; during the winter they should learn something of administrative policy in the neighboring towns, and finally, they should make a record of what they thus learnt.

<sup>18</sup> Ernst von Meier, *Französische Einflüsse auf die Staats- und Rechtswentwicklung Preussens im XIX Jahrhundert* (Leipzig, 1908), Vol. II, p. 65.

The state did not leave to chance the creation of the requisite faculties in the universities, but in 1727, Frederick William established a professorship of cameralism at Halle and Frankfurt to teach "the principles of agriculture and police, also the institution of surveys of offices and estates, and also the efficient administration and government of towns."

It is convenient not to break off here, but to pursue this history of recruitment to the final point it reached before the storm of the French Revolution and the period of the great reformer at the turn of the eighteenth century. Theory marched with practice, and the specifically German contribution to economic and political science of the eighteenth century occupied itself continually with the problems of the formation of a satisfactory civil service.<sup>17</sup> For example, Gasser, first professor of economics at Halle, shows clearly how insistent were the royal desires to change the basis of admission into the service from legal training to a more general education. The lawyer is too involved in pedantry and tricks.<sup>18</sup> Zincke<sup>19</sup> pointed out the need for a broad education in all the sciences appropriate to the state's task: namely, "to improve and perfect all that constitutes the temporal weal of its members." Justi,<sup>20</sup> himself in the Prussian service of mines for some time, emphasizes the importance of cameralia or *Staatswirtschaft*: that is, the whole complex of administrative-cum-economic-cum-planning-science taught at Halle University. The state may be compared to a machine; hence all its parts—that is, the offi-

cials—must be appropriately recruited and managed to its purpose.<sup>21</sup>

The examination system was rounded off principally by rules laid down in 1748 and 1770. A candidate for the higher government service must have had a good academic record. Upon application to the government, he was first given a written examination by a particular department, and then followed an oral examination before the Chamber Examination Commission. The one year's experience in a local department in accordance with the rules we previously described was required, in addition to the academic preparation upon which the examination was based. The commission reported to the department, the latter to the general directory. The second and final examination was taken with permission of the department, no period between the first and second being prescribed. It consisted of a written part, in which there were papers in jurisprudence and in administrative science (*polizei*) and in the survey and valuation of an estate, and an oral part, which could ramify over all branches of finance, natural law, and other subjects contiguous to the science of public finance. Some of the records relating to these oral examinations are extant and show with what comprehension and thoroughness the examiners executed their work, if not their victims.<sup>22</sup>

*The Civil Service a Profession.* What now, we may ask, was the essence of this development? The administration of the state had been professionalized; that is to say, it now depended upon a body of men permanently employed upon special work, their activities being uniquely at the service of the state and being purposively regulated and disciplined to accomplish its specific ends. A system of educational preparation had been established the like of which no other state demanded until the lapse of more than another

<sup>17</sup> G. Marchet, *Studien über die Entwicklung der Verwaltungslehre in Deutschland von der Zweiten Hälfte des 17 bis Zum Ende des 18 Jahrhunderts* (Munich, 1885), and A. Small, *The Cameralists*, (Chicago, 1909).

<sup>18</sup> Small, *op. cit.*, p. 210. Gasser said: "His Majesty the King of Prussia resolved to establish *Professores Oeconomicae* at the universities of Halle and Frankfurt, who should teach the students the principles of agriculture, policy, and also the establishment of budgets of offices and estates, and, further, the proper administration and government of towns."

<sup>19</sup> *Ibid.*, p. 228.

<sup>20</sup> *Ibid.*, p. 294 ff.

<sup>21</sup> J. H. G. Justi, *Gesammelte Politische und Finanzschriften*, etc. (Copenhagen and Leipzig, 1761), Vol. I, p. 8.

<sup>22</sup> Cf. Ernst von Meier, *Die Reform der Verwaltungsorganisation* (Leipzig, 1881), pp. 30-34.

century, and in its composition there was secreted the most appropriate training imaginable for the eighteenth-century state, by no means without lessons for our own day: for it required a knowledge of real as well as of written things, and both kinds of knowledge appertained to the actual institutions by which men earn their living and pursue their social destiny. A resolute, impartial, energetic, and honest spirit had been breathed into the service, and it became, side by side with the military career, the vocation *par excellence* of the most ambitious young men. Henceforward, the civil service became a career to which many families, generation after generation, contributed their talent, and it was a deliberate purpose of Frederick the Great's to draw into the civil service successive generations of the same family to create the proper mentality of servants of the state. The noble received a certain preference, but less under Frederick William than under Frederick the Great, and even then only if the minimum regulations had been met.<sup>23</sup>

The state had been almost altogether centralized: it performed an enormous range of duties. Any central survey of policy was left to the cabinet, the king's immediate entourage of trusted advisers. The political testaments of Frederick the Great, as well as his actual manner of government, show clearly how the reins were all brought into the cabinet and thence to the Crown.<sup>24</sup>

A well-conducted Government must have system as well-knit as any system of philosophy; all measures taken must be well-considered, and finances, policy and the army must move together towards the same purpose which is the strengthening of the State and of its power. Now, a system cannot emanate except from one mind; therefore it must issue from that of the King. . . . More vividly affected by what he thinks, than by the thoughts of others, he will follow his plans with the fire necessary to make them succeed; and his pride which at-

tracts his interest to the work will become useful to the country . . . Sovereigns of the first kind (who themselves rule) are like the souls of their State. . . . They have, like God (who uses a mind superior to that of men in order to operate upon their wills), penetrating and industrious minds, to execute their plans and to fulfil in detail that which they have projected in the large; their ministers are properly instruments in the hands of a wise and clever master.<sup>25</sup>

For nothing had Frederick the Great more contempt than the French practice of a weak king and mutually independent and hostile central departments.<sup>26</sup>

#### DECLINE AFTER FREDERICK THE GREAT

THIS might have proved for a century or more to be an efficient system of government. But already there were two features that might easily become defects: the service was militarized, and one personality, the king's, overshadowed all the rest.

*Militarization.* The service was militarized by Draconian discipline and by the rigidity of its classes. The subaltern ranks of the service were intentionally filled with those who held subordinate posts in the army. From these officials the king required "enthusiasm, regularity and punctuality, and unconditional obedience to directions and official regulations."<sup>27</sup> The frequency of war caused occasional surpluses of men in the intervals of peace, and the jobs in the local services of the central authority were almost entirely made over to the military candidates. This service was on the whole subordinate to the first purpose of the state—the extension of its dominions. Infused with military spirit and dedicated to military ends, it was quite natural that under Frederick William and Frederick the Great, its paramount purpose should spoil the instrument for any other objects perhaps more desired by the population, the true interests of which were welfare rather than international glory.

<sup>23</sup> Ernst von Meier, *Französische Einflüsse etc.*, Vol. II, p. 58.

<sup>24</sup> *Die politischen Testamente Friedrich's des Grossen*, edition of Professor Gustav Berthold Volz (Berlin, 1920), pp. 37, 77, etc.

<sup>25</sup> *The Anti-Machiavel*, published by Jean van Diven (Hague edition, 1741), p. 276.

<sup>26</sup> *Ibid.*, p. 37.

<sup>27</sup> Lotz, *op. cit.*, p. 159.

One personality overshadowed and drove all the rest! The Prussian state before 1740 had been compared to a great school and the king to a headmaster.<sup>28</sup> What should happen when the task grew too big, or when external pressure took the mind of the genius away from domestic affairs? It was inevitable, if that should happen and civilization produced these conditions, that the wheels would continue to turn for a limited time, and then require adjustment, not to another great man and many "average" subordinates, but to "average" men only.

*The Polizei-Staat.* What was radically at fault with the apparatus as a form was its dependence upon an impulse from above and within, and upon its own strength and knowledge. It would have been extraordinary for kings who called themselves the "first servant of the State" to serve on any other terms but their own, or to admit the superiority of anybody else's wisdom. They could not admit either the wisdom or the right of the people to determine the main lines of policy. Political theory as yet opposed such a field of liberty, and the administrative science of cameralism did not provide for the participation of the administered. All roads led to what is now called the *Polizei-Staat*. We have already explained that *Polizei* in seventeenth- and eighteenth-century administrative and political science did not mean the mere maintenance of the peace. Its connection with constabulary was inappreciable. It comprised almost all that we know today as the administration of economic and social institutions. Mayer, the German constitutional lawyer, defines it shortly: "Police: that which gives the whole its distinctive mark, and becomes a comprehensive and systematic working-up of the human material available in order to lead it towards a great goal." Its outlines were: strict obedience of the subjects to the king, who was the first servant of the state; the legal omnipotence of the royal will; a civil service which was the expres-

sion of this will; and in practice, the enormous range of the state's power.

Toward the time of the French Revolution, the system no longer operated with the effectiveness of a generation earlier. Cameralism and mercantilism—it is possible even to talk of state socialism—had led it into a range of activities which could be successful only by decentralization and popular cooperation; the military spirit had overcome that of social service, and strictly disciplined hierarchies ramifying through a large country were mentally too inflexible to invent the necessary devices to vanquish routine. The service was obedient but lacked that personal interest in the result which is the salt of industry. The single-headed genius had departed and multiple-headed Demos was not yet called upon to propel the machine or renew its defective parts. While Frederick William had been the personal president of the general directory, Frederick the Great and his cabinet now directed activities by memoranda, and the central departments increased in number. When Frederick the Great died, the directory had lost its cohesion and the cabinet its driving force. But, says one of the greatest authorities:

this police-power operated grimly and unmercifully; with an impulse of eudamonic and social welfare it threatened to annihilate the definite private sphere of individual freedom. It threatened, as Tocqueville said, to change society into a prison or a barracks. In an Administrative Order of Baden in 1766 the following appeared: "Our Royal Administrative Council is the natural guardian of our subjects. It is its duty to lead our subjects from error and show them the right path; to teach them even against their will how to manage their own domestic affairs." Were this standpoint accepted, then ultimately one would be obliged to place a State official by the side of each citizen for life.

*The Revolutionary Age.* There now took concrete and institutional form those conceptions of social relationships and government which were proclaimed by the pioneers of the French Revolution. The Physiocrats and Adam Smith powerfully challenged the economic assumptions of

<sup>28</sup> Schmoller, in *Preussische Jahrbücher* (Berlin), Vol. 26, p. 552.

Colbertism and cameralism, and they could be no less explosive of the political institutions which embodied them. In Kant and his colleague Kraus,<sup>29</sup> at the University of Königsberg, a stimulus was given to political and economic individualism and to the reign of law in which each individual should be regarded as an end and not as a means. The enlightened despotism of Frederick the Great and Christian Wolff were discredited by these new prophets, and those who sat at their feet in 1780 and the following decade were the foremost officials toward 1800. If the startling ideas and events of these years made immediately no great inroads upon the institutions, they did upon the mind, of Germany, and yet only as a "revolution from above." The influences of laissez faire and democratic theory were effective in Germany only upon a portion of the bureaucracy, and, further, upon the philosophers. It is fair to say that philosophy was affected more than the men with practical power. The fact was that monarchical ideas were strong because the monarchy had not been inefficient, and it had deadened the people with military discipline and conserved the economic and social privileges of a landed nobility.<sup>30</sup>

The centralized military and police state held together until Napoleon smashed it. Only its desperate need caused King Frederick William III to invest supreme authority in Stein, the only man who was able to conceive, if not realize, the essential reforms. It was not Stein alone who conceived the reforms, settled their principles, or worked out their details. He was encouraged and helped by colleagues and subordinates of equal genius in their own spheres: von Schon, Hardenberg, Scharn-

horst, Gneisenau, Vincke, and the two brothers Schrotter and others. But he was possessed by the passionate desire for his end, the capacity for sustained endeavor, and the flaming but controllable impatience, in the degree of intensity which convinces the doubtful and overcomes the obdurate. This spirit, aflame and invincible, was conducted by a mind and character formed and tempered by affairs. Experience as a Prussian official for nearly a quarter of a century had taught him the nature of the Prussian bureaucracy; and to him, that nature was synonymous with ossified weakness.

Stein's criticisms were directed against both the form and the spirit of the administration. He looked to reforms in the direction of decentralization and the popular consultation, and a rearrangement of central machinery. As regards the latter he suggested, in order to overcome the growing gulf between the special departments and the lack of unified direction, that in place of the cabinet (which though atrophied allowed of illicit influence upon the Crown) there should be a council of heads of departments who would be relieved of concern for details, and would direct and supervise the execution of the general policy of the country only. In this system the king was to receive advice only from these ministers, and to command through them only. This would limit personal government and, at least, weaken the influence of territorial differences which had hitherto been emphasized owing to the division of departments upon a provincial basis. A single treasury was to take the place of the numerous treasures. Over and above the suggested ministry there should be a Council of State (*Staatsrat*) to exercise an even more general and common directive influence upon the various departments of government: to give advice on new legislation, to discuss questions affecting all or many departments. It was to be composed of the princes, ministers, high officials, and others appointed by the king. This Council, whose uses seem to the critic to be an unnecessary addition to the ministry, never came into existence. We have already used the term "Min-

<sup>29</sup> See Ch. J. Kraus, *Staatswirtschaft*, 5 vols. (Königsberg, 1808-11).

<sup>30</sup> G. P. Gooch's *Germany and the French Revolution* (London, 1920) amply shows this. Those who have worked on the first-hand materials of Gooch's book cannot fail to bear tribute to its conscientious and able scholarship.

Cf. for another survey of the eighteenth-century Prussian bureaucracy, W. L. Dorn, "The Prussian Bureaucracy in the Eighteenth Century," *Political Science Quarterly*, 1931, 1932, pp. 75 ff., 403 ff., 259 ff.

ister." It was Stein's project to abolish the "board" or "collegiate" system, and to have a single head for each department. These heads in council, under the permanent presidency of the king, would have had many points of resemblance to the early cabinet system in England, but since Frederick William III preferred one minister to act as intermediary between him and the others, a cabinet system could hardly be said to have come into existence: instead, one minister became predominant and this gave rise to the modern German chancellorship and Prussian minister-presidency which still strongly retain and reveal their embryological features.<sup>31</sup>

The provincial authorities were to be reorganized so that each branch thereof corresponded in extent of administration with a special central department; and it was suggested that all affairs which could be left to the independent local execution by these provincial authorities ought to be. A large reorganization of the local agencies of the central authority should then follow.

It is at this point that Stein utters those opinions about Prussian administration which most concern us.<sup>32</sup> His criticism of the bureaucracy was sharp:

We are governed by *paid, book-learned, disinterested, propertyless* bureaucrats; that will suffice so long as it suffices. These four words contain the character of our and similar *spiritless* governmental machines: *paid*, therefore they strive after maintenance and increase of their numbers and salaries; *book-learned*, that is, they live in the printed, not the real world; *without interests*, since they are related to no class of the citizens of any consequence in the State, they are a class for themselves—the clerical-caste; *propertyless*, that is, unaffected by any changes in property. It may rain, or the sun may shine, taxes may rise or fall, ancient rights may be violated or left intact, the officials do not care. They receive their salary from the State Treasury and write, write in quiet corners, in their departments, within specially-built locked doors, continually, unnoticed, unpraised. And then again they educate their children for equally useful State-machines.—One machine (the military) fell on October 14th, 1806. Perhaps the writing-

machine will have its 14th October! There is the ruin of our dear Fatherland; bureaucratic power and the nullity of our citizens!

The civil service lacked life, inventive power, ability to serve the needs of the population, enterprise: impotence had overcome it and it was out of touch with the life which surrounded it.

*The Bureaucracy in the Nineteenth Century.* Judgments of that kind continued to be passed upon the civil service throughout the course of the nineteenth century. What is extraordinary, however, is that the rest of the world somehow formed the belief that this civil service was the ablest in the world; and in fact, it did some first-class work. Even while Stein was writing in retirement, it carried out, under Hardenberg's chancellorship, many far-reaching reforms, and it continued to do so until after the middle of the nineteenth century, without the co-operation of a representative assembly.

By 1800, a reform should have been made of the educational preparation for the civil service to correspond with the tasks set by an age new to Germany. It is material, therefore, to review the type of criticism passed upon the ethos and the mentality of the service. (We later—Chapter 31—proceed to a study of recruitment in the nineteenth and twentieth centuries.)

In 1844 there appeared at Hamburg a small book entitled *Bureaucracy and Officialdom in Germany*.<sup>33</sup> The author attempts to show how enormous is the size of the service, an exercise which earlier and later generations have all enjoyed. He arrives at a total of 700,000,<sup>34</sup> and says: "These 700,000 promote the welfare of the subjects, secure their life and property, administer education and in-

<sup>33</sup> *Bureaucratie und Beamtentum in Deutschland, I. Preussen* (Hamburg, Hoffmann and Camte, 1844), p. 72. The author's name does not appear, and the book purports to be a translation from the English of a Lord's steward who was in Germany for nearly ten years. But the book is written with so much animus, such a bitter hatred of the bureaucracy that it is doubtful whether an Englishman would have been so interested in German affairs.

<sup>34</sup> They include the judicial authorities, the teachers, and the clergy.

<sup>31</sup> Cf. Chap. 25 on the German cabinet system.  
<sup>32</sup> From the Nassau Memorandum.

struction, judge evildoers, and edit, inspect, super-edit, control, decree, foster, journalize, chew over, insinuate, execute, remit everything, and so on."

The service had become a caste, sundered from the rest of society, in particular owing to the stringency of official secrecy, which unduly prevented civil servants from discussing affairs with the public whether orally or through the press. Our anonymous writer remarks that "it is a curious contrast that the first Protestant State of the Continent uses, as the basis of its administration, a principle which is the strongest pillar of Ultramonism." (Not so curious or surprising, as we shall see when we arrive at the end of our discussion of modern administration, Chap. 31).

Like the Catholic Church, the civil service tolerates no deviation from the faith, not the slightest, lest one change produce a greater. Fearful of losing its power, it does not accommodate itself to progress.

The spirit of Prussian administration is in many respects in direct contradiction to the spirit of the Prussian State, that is, the Prussian Government, and should the Government desire to be never so liberal, the Administration will maintain the opposite tendency as long as it can. The contradictory elements are, on the one side, the spirit of the Reformation State, on the other, organization according to the military State. The former is the ally of popular activity, the latter the resort of reactionary administrative activity. Bureaucracy can as well be compared with the military system as with a hierarchy, and is often compared with it. The three are parallels: military, hierarchy, bureaucracy; all rest upon the divine right of despotism, which wills no exception, no leniency, no progress, but only blind devotion and the eternally unchangeable acknowledgment of its infallibility. The three maintain themselves by unconditional obedience; the means by which obedience is maintained is fear; and this is maintained by dependence. The dependence of Prussian Civil Servants is rigidly secured by two devices: secret reports and the strict maintenance of official secrecy. The former reminds officials every moment of their superiors; the latter of the office.<sup>35</sup>

The result is a machine directed against the people, at least, when the people's will is something other than the will of the civil service. Within itself the organization receives its direction and energy from suspicious severity, and the control of detail by superiors, not from trust of the freely exercised discretion of subordinates. The moral strength of the officials is not evoked; and with all its mechanical accuracy the administration lacks a spirit of honor.

There are many other opinions of interest in this brochure, but the chief substance has been given and it shows, we think, where the fault of the Prussian civil service was considered to lie in the decade 1834 to 1844. A year afterwards this criticism was supported by a book called *The Prussian Bureaucracy*.<sup>36</sup> Its temper is similar to that which we have just described, but it surveys the field with a more level and composed demeanor. It is antipathetic to the civil service because that service is not directed and controlled by the people, and the author deems that from this fact flow a number of evils, chief of which, summarily described, are bureaucracy in the service and the political nonentity of the citizens. Since 1815, in fact, the civil service had been the instrument of oppression of liberalism, and it is not surprising to find here as elsewhere judgment centered not upon any examination of the technical efficiency of the civil service in its admitted purposes, but upon the political complexion of the critic. Were the writer convinced of the value of an absolute, antiliberal state, then the civil service seemed to him a splendid instrument; but were he in the ranks of those who (like Börne and Heine) fought for a liberal constitution, then the civil service was at once dubbed a "bureaucracy" and reproached with showing all the worst features inherent in such a governmental system. The author whose work we are now discussing confesses this power of the point of view over the judgment, for he says: <sup>37</sup>

<sup>36</sup> Karl Heinzen, *Die preussische Bureaucratie* (Darmstadt, 1845).

<sup>37</sup> *Ibid.*, p. 71.

It is one of the chief purposes of this book to show, by an appeal to facts, that the Administration in Prussia is in no way qualified to be a substitute for the Constitution, that much more, it is the Administration which makes a Constitution most urgently necessary, together with the freedom of the Press and every kind of publicity belonging thereto.

It is from this level that the author surveys and describes his field. Another critic says that it is not the organization that makes a civil service bureaucratic, but the spirit that moves the organization.

By bureaucracy we here naturally mean not the form, but the spirit, not the body, but the soul. We mean what has generally come to be denoted as bureaucracy: the surplusage of officials and their activity, the abuses and evils of officials and departmental authority. The word bureaucracy is invective, which we cannot properly translate into our mother-tongue any more than we translate such words as despotism, canaille, etc.

This bureaucracy directly issues from Prussian absolutism. For absolutism is to be maintained only by centralization and a military and civil army. Although such absolutism came to pass under previous rulers, bureaucracy originated only when the head of the state lacked energy and benevolence.

In such a system it was bound to happen that the civil service felt its significance and status to be bound up with opposition to the people. It was forced by the situation in which it was placed—as defender of absolutism against the demand for representative government—to make its primary purpose consist of its own continued being and activity. It could not criticize its own composition and seek to remedy its defects or invigorate its spirit, nor could it tolerate criticism from without. Benevolent in intention, in manner it could not but be oppressive. "In England orders were given by the ministers who acted on behalf of the people; in Prussia orders were given by the civil service not only to themselves but to the people." The relationship between civil servant and the public may be epitomized in the words of the author as: "The limited vision, the

pedantry, the dark ignorance, inhumanity and arrogance" of the official, and the lack of remedy of the public.

This continued until the recent past to be a characteristic of the German civil services, not merely the Prussian, and history quite clearly shows that the reason of it is the lack of parliamentary institutions, or, perhaps it would be truer to say, the parliamentary state of mind. While that state of mind lacked force, absolutism prevailed, and every civil servant was bound to be actuated by the intentions—benevolent, offensive, and defensive—of the master spirit.

The relationship between superior and subordinate is analyzed with much acuteness of mind and is evidently founded on experience. On the one side there is the lust for power and dominion, with their cognate qualities and behavior, and on the other side, cringing servility, sycophancy, and those habits which men develop to propitiate the objects of their fears, and, further, the necessary degeneration of all qualities of initiative and independent creativeness in the official.

The secret reports constitute a vital element of the German civil service: an indispensable incentive to produce the character approximate to the times before the advent of democratic control. The system threw the civil servant entirely under the domination of his superior. Until the constitution of 1919, these reports could not be inspected by the person reported upon, and though, between 1845, when this account was written, and 1919, a disciplinary procedure was established which went far to abolish the arbitrary, the civil servant could never know what sort of a storm was brewing which might one day unexpectedly burst upon him. The moral atmosphere of the departments was charged with mistrust, espionage, fawning humility, and minor treachery. The compelling proof of political importance is inclusion in the constitution: and the right to inspect these reports was included in the constitution of 1919.

*Survey.* Before we can pass to a consideration of the German civil service during the period from 1850 or thereabouts

to the present (which we shall do in Chapter 31), let us survey the position so far reached. Prussia (and with some variation the other Germanic states) was governed in the middle of the nineteenth century by an official hierarchy which was intensely bureaucratic in temper, uncontrolled by any popular representative institution and contemptuous of such, enjoying a jurisdiction of exceedingly wide extent and managed through centralized institutions, excellently efficient in formal and routine functions, and adept at the drafting and interpretation of rules and laws. This efficiency was assured by the rules of recruitment, and the ascription of a special social prestige to the civil service. These did not any longer produce inventiveness and plasticity of mind. Of this we have Bismarck's assurance, based upon his own experience as *Referendar* just before 1840. We shall see that as soon as Germany was called upon to serve positively and construct in the field of modern social and economic problems, instead of merely to keep order, the civil service was deemed either to be insufficient by itself and to need the aid of other institutions, or to require a radical reform of its education.

The books and the men I have consulted lead me to believe that between 1815 and 1871 the technical efficiency of the Prussian civil service was of a very high grade, and on the whole quite sufficient to the tasks imposed by the political, social, and economic conditions of the time. Not, indeed, until the third quarter of the nineteenth century did that country begin to be shaken by the mighty travail of a new order of state and society, and until the issue of that travail required official care, the old dispensation worked not unsatisfactorily.

*Social Composition of the Service.* The Prussian civil service was in its upper ranks the product and the monopoly of two classes—the nobility and the upper middle class, or the "bourgeois particiate" as it is commonly called. The avenue to power was not open to the classes lower than these, for the necessary educational preparation presupposed means

which could maintain a young man in easy and respectable circumstances until the age of about twenty-seven or twenty-eight.<sup>38</sup> Even were these means available, yet further obstacles were placed in the way of general recruitment: the candidate was required to be "friendly to the state"—that is to say, conservative, of "good" family, a member of students' *corps* or a reserve officer, and as a rule a Protestant Evangelical. Hanover was especially subject to the class monopolization of the civil service. There were certain advantages about this method of recruitment: the family tradition of state service was a valuable guarantee of loyalty and devoted industry; the young men had a habit of government; and a sameness of origin gave rise to *esprit de corps*.<sup>39</sup> But what was praised as *esprit de corps*<sup>40</sup> by one set of people was blamed by ever greater masses of the population as the "caste spirit," not something which impelled to the *clan* of concerted activity but that which fostered a forbidding exclusiveness. The habit of government learned on Junker estates was apt to take on a sinister aspect to those who experienced its exercise—class rule and class government were bitterly resented, and the bureaucracy (especially those who were drawn from the army) was the anathema of the growing working-class movement. Loyalty and devoted service are not synonymous with administrative and political creativeness, nor with service to the whole of society regardless of class privileges. But here the discussion of German bureaucracy must merge with that of other countries. We shall compare their ultimate solutions in the same chapter, Chapter 34.

<sup>39</sup> Cf. H. Oncken, *Rudolf von Bennigsen* (Stuttgart, 1910), Vol. I, p. 33 ff.

<sup>40</sup> Cf. Hegel, *Philosophy of Right*, para. 297: "The members of the executive and the State officials constitute the main part of the middle class, in which are found the educated intelligence and sense of right of the mass of the people . . . The sense of state and the most conspicuous education are found in the middle class, to which the State officials belong."

## *Origins and General Character: France*

WE must make acquaintance with the chief characteristics of the administrative institutions and manners to which the France of the nineteenth and twentieth centuries was heir. For the history of these later years has consisted very largely of the attempt to escape from the deficiencies of the administrative organization and spirit developed in the centuries we call collectively the *ancien régime*. The attempt to escape has been less forceful than the avowal, so that the *ancien régime* is still more than a reminiscence.

The features of French administration which leap to the eye from the study of its development are centralization, *Étatisme*, the venality of offices, the passion for place, the caste differentiation of officials, the popular detestation and suspicion of public administration, the establishment of administration, and the establishment of administrative law. All of these, excepting the venality of offices, are still present in modern France, but with differences of importance due to the influence of respect for private and local liberties and the abolition of arbitrary government. The venality of offices was killed by the revolutionary principle of "the career open to the talents," though it has taken over a century to destroy its successors, favoritism and patronage, and to replace it completely by recruitment by merit. These qualities are products of the *ancien régime*. The widely-current popular notion that centralization and the

power of the state are Napoleonic creations is erroneous: Napoleon was given as many opportunities as he made.

### THE RISING TIDE OF CENTRALIZATION

*Its History.* France is the classic home of centralization, as it is of the doctrine of royal sovereignty, and for the same reason. These are not emanations of the French racial character, but the direct results of French feudal arrangements, which created hundreds of independently privileged lords and localities. The first result was a polyarchy indistinguishable from anarchy, though it was then the natural order of society, and the second, rivalry between the equally privileged for personal predominance. This competition among ducal houses filled the twelfth to the sixteenth centuries with war, rapine, daily violence, assassinations, murderous treachery, cynical ruses, misery among the common people, and periodical despoliation of the *bourgeoisie*, while kings and would-be kings died early and sudden deaths by poison or the dagger. Yet fitfully a single power added to its dominions. The usual phenomenon of centralizing power was witnessed; the Crown called to its aid not nobles, but clever and insignificant persons, and it showed mildness toward the *bourgeoisie*. By the end of the fifteenth century, monarchy had established itself, and from that time it sought to make good its hard-won authority by the imposition of its govern-

ing will all over its diverse conquered lands. The days of the centripetal forces were numbered.

From the accession of Louis XIV, the monarch was unchallenged by feudal pretenders, and it turned its attention away from the first task of all governments, the reduction of opposition, to the second, the regular provision of daily utilities. Long reflection upon the struggles of the monarchy with its noble competitors has convinced me that the grimness of French centralization was a direct and natural answer to the ungovernable refusal to be governed. Its exaggeration exaggerated centralization, which persisted throughout the reign of Louis XIV and Louis XV: in both it was the source of bitter complaint by the parliaments and local authorities. Under Louis XVI it continued to function, but towards the time of the great Revolution its character softened, its despotism became, in the language of the late eighteenth century, "enlightened" and "humanitarian." Nevertheless, a formidable despotism it was; the people had no effective part in either central or local decisions; and it required even more than the Revolution of 1789 to secure it.

Let us see through what institutions this centralization operated. The monarchical power was extended by the institution of intendants: that is, by representative managers or administrators. Their history appears like successive waves from a central source. A weak and transitory movement first begins. The next is more definite as the purpose of Richelieu and Colbert behind it is more conscious and deliberately planned, and it overwhelms the ground before it by its purposeful force. The tide is full in the last years of Louis XIV and the reign of Louis XV, and it masters all obstacles and it recedes only when the monarchy under Louis XVI is affected, though not completely convinced, by the strange but compelling philosophies of the democrats and the Encyclopaedists.

*The Intendants.* Much has, however, been said about the intendants. Some writers relate them, though remotely, to

the *missi dominici* of Charlemagne and the *enquêteurs royaux* of Saint Louis. A careful and discerning historian, M. Hanotaux,<sup>1</sup> shows that the intendants began as itinerant justices, of inspectorial and appellant rather than original jurisdiction—began, that is, in the institution known by the graphic name of *les chevanchées des maîtres des requêtes de l'hôtel*. The *maîtres des requêtes* were judicial officers who originally received complaints and requests addressed to the king, and reported these to him; they sat in judgment, with the king, upon these requests. In the interests of royal justice, which not infrequently was in competition with that of the parliaments and the relics of feudal courts, they went on circuit through the provinces.<sup>2</sup> These were their status and functions in the middle of the sixteenth century with which we are now concerned; their later history is interesting but belongs to another part of this study.

The intendants first appeared in the provinces in the company of the commanders of the royal armies when civil or foreign war was rampant. Tentatively established earlier in the century, they were withdrawn during the Wars of the League. They exercised powers which varied with the necessity for the exercise of power. They were called "intendants of justice, police, finance, victuals and of the military authority," and "commissioners sent into the provinces to execute the orders of the King." Their functions with the armies soon became insensibly attenuated, especially as the armies left; and the term "commissioner," which savored of unsettled, warlike, abnormal times, ill-accommoded with the character of the intendants after the *Fronde*, and was, in fact, mainly used as a term of disapprobation by opponents of centralization before and after the great Revolution.<sup>3</sup> It took nearly a century, from about the

<sup>1</sup> G. Hanotaux, *Origines de l'Institution des Intendants des Provinces* (Paris, 1884).

<sup>2</sup> Cf. Albert Babeau, *La Province sous l'Ancien Régime* (Paris, 1880), Vol. II, Chap. I.

<sup>3</sup> A. de Tocqueville uses the term in *De l'Ancien Régime* (Paris, 1850).

last quarter of the sixteenth until the middle of the seventeenth century, for the intendant to shed his military character and become part of the normal apparatus of government.<sup>4</sup> At first *gens de lutte*, they now had become *gens de bon ton*.

From the beginning, the intendants roused the hostility of the quondam rulers of the provinces and towns. These early intendants did not stay long—a year or two was usual—and gaps of years often elapsed between the withdrawal of one and the commissioning of a successor. Further, their powers varied. They intervened in matters which were peculiarly liable to cause local disaffection: justice, finance, and municipal politics. In the first, they came into conflict with the nobility and the clergy, whose claims they often had to deny, and against whom they had to give judgment. In regard to finance, they had the power to examine the accounts and procedure of the collectors of taxes and deal with malversations, and to see that recalcitrant evaders were pursued. Their judgment was above appeal save to the royal council. And they could participate in the work of all courts of justice, preside even, give judgments, while the judges and royal officials were commanded by the Crown to obey and implement their decision. They settled differences between the officials themselves. In municipal politics they received powers which enabled them to call a truce to disputes of local factions which in some places resulted in chronic disturbance of the peace, and these powers became in the long run so great that local self-government became disastrously limited, the forms remaining with the municipalities while the authority was transferred to the intendant.

The intendants were chosen among the most intelligent and dependable members of the king's council and they correspond with the secretaries of state, sometimes with the king.<sup>5</sup> In the province they ap-

plied the *raison d'état* as learned directly in the council of state, and they did not stay in the province long enough to suffer this to be modified; often, indeed, they attained high power in the Council of State. Just before the reign of Louis XIII and the advent of Richelieu, their powers were already great, and an increased assurance is observable in the tone of the royal commissions—the words *power, authority, commission, special command, will and ordain, enjoin, authorize, approve and validate* are scattered with generous profusion.

With the advent of Richelieu the final state in the development of the intendants commenced. There was a change of such striking quality in spirit that many historians have ascribed to Richelieu the inception of the system. But Richelieu's genius consisted in the infusion of the existing institution with the full creative force of his own personality. It was the beginning of creative centralization, and Richelieu's innovating genius and fierce energy electrified the provinces, and in time reduced them to submission, but not to complete acquiescence. Intendants were sent to every *généralité* (divisions of a province) except the two or three nearest to Paris. The mere reception of an intendant by a province was, however, in those days a victory for the monarchy, for the *Parlements*: i.e., all the lawyers, in particular, were desperately hostile and the centers of local resistance. The numerous edicts and statutes gave them unlimited opportunity to challenge royal power, and they used the fine arts of interpretation to invalidate the intendant's jurisdiction. Their ultimate resort was the refusal to accept any royal commission which they had not registered, that is, discussed and accepted as due law.

The celebrated *Code Michaud*, an *ordonnance* to reform the kingdom, was drawn up in 1629. Article 58 of that code prescribed the powers of the *maîtres des requêtes*, and in such wise that its negotiation by the *Parlements* was certain. At

<sup>4</sup> Boyer de Sainte-Suzanne, *Intendants de la Généralité d'Amiens* (Paris, 1865), p. 87.

<sup>5</sup> Cf. Le Comte De Luçay, *Les Secrétaires*

*d'État depuis Leur Institution jusqu'à la Mort de Louis XV* (Paris, 1881), Chap. III.

a distance of twenty-three articles from this, that is, in article 81, was insinuated the rule that "No one can be employed in the office of intendant of justice or finance, deputed by us in our armies or provinces, who is . . ." and then follow a few prohibitions. The institution was thus established in the law, for discussion ceased at article 13, and article 81 was passed without discussion.<sup>6</sup> The *Fronde*, in fact, was the last attempt of the vested interests of feudalism to put off the triumph of the absolute state: the nobles united with the richer *bourgeoisie* to smash the power which threatened to make away with their privileges and to collect the taxes it demanded. The absolute state won, in terms too easy as the Revolution afterwards showed—and the trustees of this victory were, for the next century and a half, the monarch, his ministers, and the intendants.

*Colbert.* Under the rule of Colbert, supported by Louis XIV, whose application to administrative detail earned him the name of *roi administrateur*, the powers of the intendants increased in effectiveness.<sup>7</sup> Wherever any of the older authorities showed a weakness—as, for example, in the affairs of the clergy and the universities—the intendants stepped in to advise, control, or directly administer. Wherever there was no authority adequate to new tasks projected by the ministers—the making of roads, canals, bridges, fortifications, and the regulation of industry—the intendants were saddled with new functions. They were expected by the king to control the *Parlements*, and they did, though in the face of shrill remonstrances.<sup>8</sup> We shall see later how perfect centralization was rendered im-

possible by the sale and hereditary nature of offices: how, since the revenue derived from these was essential to monarchical policy, this very necessity meant the creation and maintenance of independent magistrates who could oppose the royal power.

Colbert was an utterly callous administrator. Once convinced that his purpose was good by *raison d'état* (or, as we might say, with perfect truth to political psychology, *raison de l'état Colbert*), he searched for the means best adapted to fulfil it, and this discovered, he had none of our conventional scruples: he dismissed, appointed, rotated officials, gave and denied favors, served with his tongue in his cheek, and detracted his equals and superiors. The incarnation of order and industry, he gave neither rest nor indulgence to his colleagues, his subordinates, or, indeed, the king.<sup>9</sup> The passion of the reformer which he ceaselessly endeavored to conduct to the intendants is amply shown by his enormous correspondence.<sup>10</sup>

When we reflect upon the immense number of public activities which Colbert either established or extended, and remember that the efficacy of it all depended upon the initiative of the central authority, since this was unwilling to share power with the old local authorities, or quasirepresentative assemblies, we can understand what an enormous amount of driving power was needed at the center, and what minutely obedient instruments were needed at the extremities. Industries like lace, silk, and Venetian glass were established or developed; native

<sup>8</sup> Paul Viollet, *Le Roi et ses Ministres* (Paris, 1912), p. 536. This contains excellent bibliographies, and renders unnecessary more references than actually are here given on the intendants.

<sup>9</sup> The latter, who boasted that he *was* the state itself (or so a legend has it), was made the servant of Colbert's will by Colbert's flattery. Phrases like "Your majesty had told us in two words what the deepest meditation of the cleverest men in the world could invent only in several years" put the scepter into the hands of the servant.

<sup>10</sup> This appears in full in the *Correspondence Administrative sous le Règne de Louis XIV*, edited by G. P. Depping (Paris, 1850), 4 vols., especially Vols. III and IV; it also appears in excellent selection in Pierre Clément, *Histoire de Colbert et de son Administration*, 3rd edition (Paris, 1892). I give the references to Clément as this is most accessible.

workmen were prohibited from leaving France and foreign craftsmen were encouraged to enter; the guilds were entrusted with powers to regulate trade and industry and themselves needed regulation; commerce in the most important native agricultural products was carefully regulated; fleets, arsenals, bridges, roads, and canals were built; mining was encouraged; forestry was regulated and horse breeding developed; criminals and vagabonds were unmercifully pursued.

*The Qualities of the Intendants.* Locally, the intendants were the local points of all this activity. Now it is quite obvious that any such extent of state activity is unrealizable without a large and competent body of officials. This is exactly what France lacked. The intendants were judicially trained officers. They were men who had gone through the legal training of the day. This was exceedingly formalistic and could not be said to prepare young men for an administrative career.<sup>11</sup> At the most, it enabled them to know their legal place in a territory closely contested by other lawyers. But it did not follow that legal training had even that effect, for the consummation of this was a judicial office, and as these were purchasable and hereditary, the power to purchase was the real key to entrance upon a legal career, and the politics and administration of the day were reserved mainly to the lawyers.<sup>12</sup> Of these, those with influential relatives or friends at court or in the Church, or those favorites of favorites, male or female, obtained office and promotion by intrigues. As soon as one member of a family acquired office, he began to pull every available string for the benefit of his relatives. Even Colbert's

brilliant genius was several times shadowed and almost extinguished by men aspiring to the same career; and a man of the ability and noble nature of Olivier D'Ormesson was lost to the service of the state for the very quality—judicial integrity—that should have won him the highest office but did not because it was exercised against Colbert for his ruthless and lethal attack upon his predecessor Fouquet.

This does not mean that patronage always had or has had results, for the king and the ministers had their own credit to guard. And this is precisely the defect of patronage: when the patrons care little or not at all for their own credit, the offices go to the worst, and the most competent keep out of the system or, through discouragement, cease to work. What was commended as a policy to increase the material welfare of the people tended to petrify and become a deadening tyranny.<sup>13</sup>

It is clear that the intendants could achieve nothing without the aid of subordinates, and all the minor officers in the employ of the various departments of the council of state were at their beck and call. Further, the officials, paid and unpaid, of the local authorities, were their servants also. Both classes of officials, as far as we can see, showed neither ability nor willingness. They were recruited in one of three ways: (1) they were elected (e.g., parochial collectors of the revenue) and like the English overseers of the poor of the same time were only too anxious to shuffle off their onerous and unpaid duties; or (2) they purchased their office, as in the case of most of the central authority's officials, and saw in it only the means of oppression and the extraction of the maximum fees, bribes, and the other profits, while they gave the minimum of service, all the while maintaining an irritating independence of the intendant; or (3) they were appointed by the Crown or the intendant at discretion,

<sup>11</sup> The examinations conducted by the legal corporations were farcical. See e.g., Ch. Normand, *La Bourgeoisie Française au XVII<sup>e</sup> Siècle* (Paris, 1908), p. 652 ff.

<sup>12</sup> *Le Journal d'Olivier Lefèvre d'Ormesson*, edited by A. Cheruel (Paris, 1860), 2 vols., tells this story, and is an invaluable record of politics and administration under Louis XIV. Cf. also the careers of the Ormesson and Molé families in Normand, *op. cit.*, Chap. IV. The career of Colbert and his relatives is equally instructive.

<sup>13</sup> Ch. Godard, *Les Intendants sous Louis XIV* (Paris, 1901) sums up the jurisdiction of the intendants at the end of Louis XIV's reign (p. 440).

which meant, in fact, by the favoritism of families or mistresses. There was constant war between the intendants and the local administrative apparatus, yet without the use of the latter the intendant could not carry out his policy. The maintenance of harmonious relations with the local powers—the governors, the courts, the president of the estates (where there were estates) and the municipal leaders—therefore became of first importance, and it is not therefore surprising that not only the character of the intendant was important in this regard but that of his wife also!

*Subdelegates.* The intendants were quite early in their history (about 1640) obliged to appoint subdelegates<sup>14</sup>—at first for special occasions, later as permanent subordinates for all tasks—for primitive means of communication compelled the delegation of work to local agents. Colbert wrote to the intendants, individually and collectively, to employ subdelegates as little as possible.<sup>15</sup> It is clear that he was afraid that the full force of the will of the central government would be weakened by the employment of officials drawn largely from the locality. He complains that they will have private interests, affections, or hatreds which do not march well with the course of justice.<sup>16</sup> But the Crown was obliged to bend to the administrative necessities which it had itself created. The central authority began to treat with the subdelegates directly when this was expedient, and their expenses were paid by the king. What administrative necessity had initiated, financial necessity completed. In 1704, a subdelegacy—called an *élection*—was created by the Crown in every chief town of each administrative district, and the office was purchasable. Until that time the appointments were made at the free discretion of the intendants. As few buyers appeared for the office, they were suppressed in 1715. The duties were very vague and were as elastic as the intendant allowed them to be. These subdelegates

were paid by the intendant and by whatever fees and bribes they could extract.

There was thus established in the seventeenth century a system firmly under the direction of the central authority and extending practically over the whole territory of France. Its personnel was of very unequal quality, but some of its members were exceedingly capable administrators, and even more than that, men of fine character and genius. The later intendants, as we shall show, wore less and less the aspect of tyrants, and became benevolent administrators who were not seldom in conflict with the central authority for their local sympathies and sending a stream of reformatory suggestions to it. Between the end of the reign of Louis XIV and the Revolution, there stretches more than half a century of administrative history which De Tocqueville has described in *L'Ancien Régime*. De Tocqueville does not spare the system; the full energy of his passionate belief in liberty and decentralization is directed to paint in its darkest shadows.

The centralized system had consolidated itself, and the intendants were its instruments. In several famous and eloquent chapters De Tocqueville draws up the catalogue of France's grievances. "The Intendant was in possession of the whole reality of government." He quotes the often-quoted remark of the notorious Law to D'Argenson:

"Sir, I could never believe what I saw while I was administering the finances. You ought to know that this kingdom of France is governed by thirty intendants. You have neither parliaments, nor countries, nor Estates, nor governors, I am almost inclined to add, neither King, nor ministers. It is upon thirty Masters of Requests, sent to the provinces, that their happiness or misfortune, their fertility or sterility depend."

The volume of work for which they were responsible is enormous and has ludicrous results. They administered the unpopular taxes, principally the *taille*, the capitation tax, and the *vingtièmes*; they administered conscription for the militia, undertook the execution of public works, directed the engineers in the

<sup>14</sup> Cf. Babeau, *op. cit.*, Vol. II, p. 68 ff.

<sup>16</sup> Clément, *Histoire de Colbert*, ol. II, pp. 11 and 12.

## THE TIDE TURNS

construction of roads, maintained public order with the help of the mounted police, administered poor relief and the work houses, promoted agriculture, and supervised all the regulations governing industry. Government had assumed the place of Providence. The results were in part ludicrous and in part tragic. Foolish regulations caused officials to undertake foolish tasks: they entered into the most minute detail, for example, to ensure that cloth was made of the right dimensions and quality while producer and consumer had other wishes entirely. But other effects were more serious; people and officials became accustomed to formalities, delay, overregulation, and a surplus of reports and statistics. No one could possibly understand or keep all the rules, and therefore both officials and population ceased to take them seriously. The localities had experienced the substantial extinction of all rights to self-government, and the center of power was in Paris; to Paris, therefore, the best talents flocked, further denuding the provinces of spiritual life. The country was in the grip of a rigid and deadening centralization, one, indeed, which so worked upon the habits of men that the Revolution could not finish with it, but had to let it return because there was no other mentality ready to fill the possible vacuum. When the enormous weight of a whole system reposed upon the king or one or two favorites, capable or not, it was inevitable that from time to time the power to make decisions should fall into the hands of the subordinate officials at the center. Hence the development of what is called "bureaucracy."

### THE TIDE TURNS

As we have seen, the system had grown up in the course of some two hundred years, by a process of struggle followed by continuous and gradual consolidation. But on the eve of the Revolution—indeed, for a quarter of a century before it—changes were in progress which find too little consideration in De Tocqueville's accounts. In a brilliant study, a Russian

historian has revealed their nature.<sup>17</sup> For various reasons, the center now exerted less influence upon its local servants; the chief reasons were the increasing complexity of affairs and the growing independence of the intendants.

*The Intendants Change in Character.* The intendants became domiciled in the provinces for long periods: twenty years was by no means uncommon; many served for longer, some for upwards of thirty years. Out of sixty-eight intendants who administered France during the reign of Louis XVI, twenty-four served in one place for more than twenty years, thirty-nine for at least ten years, and only eight for less than five years. Men entered their posts in early manhood and remained often till death. What a contrast this was to the short terms of office of the ministers in Paris, and to the early history of the system!

The result was twofold: the growth of independence *vis-a-vis* the ministers, and the development of local patriotism. People talked now of the intendant as "the man of the province."<sup>18</sup> The intendant became paternally interested in the province, made his peace with the competing powers, represented the special interest of his locality, and, besides carrying out the policy of the central authority with every benevolent regard for the well-being of his area, contrived social and economic experiments on his own initiative. Office of this kind had become a family career, and there are many instances of the succession of office in the same family and the ramification of collateral branches of the family among other offices either in the same or neighboring provinces or in Paris. There was frequent consultation among intendants directly and

<sup>17</sup> Paul Ardascheff, *Les Intendants de Province sous Louis XVI* (Paris, 1909). If there is any bias in this study, it is only in the desire to point out that de Tocqueville was insufficiently discriminating about the period at which he placed the full force of despotic centralization. This was before 1760. Cf. footnote 8, and see Paul Viollet's *Histoire des Institutions Politiques et Administratives de la France* (Paris, 1903), 3 vols.

<sup>18</sup> Ardascheff, *op. cit.*, p. 81.

not through the intermediary of the central authority: they pooled their experience and lent each other their experts. Their work was made the easier by their accumulation of offices: they remained members of the legal corporations, were members of the *parlements*, and in some cases were even the presiding officer of these bodies, and what could not be obtained with facility through one of these professional channels they obtained through another.

The intendants were drawn from a class susceptible to the winds of doctrine which blew so strongly in their time. They were of the class which Ardascheff has very ingeniously named the *noblesse d'État*—that is, the very rich *bourgeoisie* which had acquired high office by its talents and money, and in acquiring office had acquired nobility—the *noblesse de la robe*. Under Louis XIV the officials had been chosen from a poorer and humbler class, they had been the spear-heads of the attack upon the pretensions of the feudal aristocracy: as Saint-Simon called it, "*le règne de la vile bourgeoisie*." They were precursors and sometimes the ancestors of this new aristocracy to whom the chief offices of state, the financial and the municipal offices, and the magistracy, were the natural heritage. They were the precursors of the absolute state; the Revolution proclaimed the overthrow of their power but did not accomplish it, and even the era of Parliaments and the career open to the talents is still largely dominated by their social and economic power. From this class came the thousand or so lawyers practicing in the *parlements* and the other high courts. They could not enter the *conseil d'état* as *maîtres de requêtes* until after at least six years' service, and this requirement reduced the source of recruitment to between two and three hundred. Other offices, retirements, and deaths reduced the office of *maîtres des requêtes*. Then not all who were qualified to be members of the *conseil* desired to be. So that the number of *maîtres*, eighty-four, was the source of the thirty administrators of the provinces.

These men were precisely of that class

who formed the staple of the *salons* of the time. Reason, Benevolence, and Progress mastered their minds and phrases and began to affect their administrative behavior; they talked the Rights of Humanity long before the crowd began to enact them. Their administrative habits became milder; their projects savored less of the study and their own uncontrolled personal will; improvement became their passion; and "love of the people" softened the rigor of their aristocratic position.

Whether or not the despotism was enlightened, it was a despotism—which operated through the intendant and his subordinates. Though the intendant mitigated the full weight of centralization, yet it was still very oppressive. Though the relations of the intendant and the province became more harmonious and mild, the province desired representative institutions, for whether or not the intendant was actuated by "humanity," he was the scion of a caste whose interests and mentality could not but exclude most that was vital to the Third Estate.

Nor was this all. You cannot pretend to govern for the good of the people without finally causing the people to want to govern themselves. Any despotic government which includes the people's good is ultimately excluded by it. It is amusing—though the upshot was tragic—to see the intendants attempting to maintain unsevered in their one bosom two warring souls, each of which they loved with a great passion: the Humanity and Benevolence of their century, which impelled them to interfere, and the *laissez faire* of the economists, which hissed "Leave them alone."

The public documents of the last few years before the Revolution show the intendants perfectly willing to promote the well-being of their provinces, and becoming more and more able to do so. Learned societies of all kinds—agricultural and other—they sponsored; inventions they encouraged; public works of utility and embellishment they planned and executed. The history of Turgot in the Li-

mousin<sup>19</sup> is by no means an isolated history, although the character of the man has made it extraordinary. Neither the character nor the ability of the intendants was to blame for the defects of the *ancien régime*; at least, by no means primarily. But the intendants were the whipping blocks, as are, always and everywhere, the officials of a machine whose purpose and propelling force are disliked.

The intendants, willy-nilly, were the instruments of extortion. They were the tools of the powerful modern state, which had taken over the government and social obligations of the feudal lords without taking away from these their privileges, or without sharing its power with the people, who, by taxation and personal labor, maintained that power. On this disparity of financial burden and privileges pivoted all the theories and acts leading to the Revolution.<sup>20</sup>

The people, charged with taxes, duties, services and obligations, of all sorts, complains of the situation and desires a better. . . It attributes, as is usual in the human mind, all the evils it suffers to the administrators it sees.<sup>21</sup>

When they attempted to even out the financial burdens by making their administrative practice violate the letter of the law, the whole of the privileged classes cursed them for meddling fools.

*Provincial Assemblies.* From long before the middle of the eighteenth century, there had been a strong undercurrent of criticism against the intendants. Aristocratic and democratic thinkers agreed in this, that the intendants should

be abolished.<sup>22</sup> By the middle of the eighteenth century even the court was affected by anti-absolutist views, especially the entourage of the future Louis XVI. In 1778, provincial assemblies were actually set up by Necker in two provinces to moderate the centralization of governmental power.<sup>23</sup> In 1787 the system with some differences, was widely extended. The assemblies failed not in their life but in their conception. For they were conceived as part of the old social order, not as the instruments of a new. As parts of the old social order, they were compelled to maintain the privileges on the one side and the burdens on the other. Therefore they could not be given any powers which affected the financial system or the sovereignty of the established authorities.<sup>24</sup> The *Tiers État* was never allowed its full voting power, and even if it had been increased to any equality with the combined *noblesse* and clergy, the functions were strictly limited. The elective element of the assemblies was therefore impotent.

*The Revolutionary Age.* When legal equality replaced privilege, the way was open for representative assemblies and decentralization; the central authority did not need to be as tyrannous as before, and the two-century-old institution of the intendants died. If it was not difficult, once social forces had shifted, to decree the abolition of the intendants, it was not so easy to escape from the tradition which had been created. For a tradition is a motive power in men; what has been sanctioned is a persuasive force, and an expedient ready-made; it saves exertion and thought and secures obedience. The tools had been abolished, but not the spirit which used the tools: centralization

<sup>19</sup> A good account is in S. d'Hugues, *Essai sur l'Administration de Turgot dans la Généralité de Limoges* (Paris, 1859).

<sup>20</sup> This is not the place to describe the structure of society. It can be found in H. Taine, *Les Origines de la France Contemporaine* (Paris, edition of 1906), Vol. I of which is entirely devoted to this; in Alexis De Tocqueville's *De l'Ancien Régime* (Paris, 1850); and, on the administration of finances, Marcel Marion, *Les Impôts Directs sous L'Ancien Régime* (Paris 1910); and, perhaps, best of all in Necker's works.

<sup>21</sup> P. Renouvin, *Les Assemblées Provinciales de 1787* (Paris, 1921), p. 89.

<sup>22</sup> Thus the Marquis D'Argenson, *Considérations sur le Gouvernement de la France*, composed about 1747, and first published in 1764 (edition 1787, *Avertissement*).

<sup>23</sup> Cf. Jacques Necker, *Memoire sur l'Établissement des Administrations Provinciales* (Paris, 1778, Stael edition), ol. III, p. 333 ff.; and his *De l'Administration des Finances* (Paris, 1784), Vol. II, p. 189 ff.

<sup>24</sup> Cf. also Léonce de Lavergne, *Les Assemblées Provinciales* (Paris, 1863).

itself had not been abolished. Only the undemocratic quality of centralization had succumbed. There was no alternative that could be set against it as a thing efficacious and proved by experience. Theory and aspirations might have provided a substitute, but the Revolution and Napoleon both needed the old method; the Revolution to cause a complete and universal break with the social and political conditions of the past, Napoleon the better to usurp and make all provinces obedient to his will. The notion of *laissez faire* was ever foreign to the Continental mind, and the French did no more than salute and march past it; yet that notion is essential to the readiness to give and take local self-government. Revolution followed revolution, reaction followed reaction; and the impulse of each sudden change was to impress itself over the whole country. No régime had the time and security to grow mellow or experienced enough to share its power—none but the Third Republic. And then by the middle of the nineteenth century, when decentralization had to some extent been practiced, and when its value was beginning to be understood, the evolution of science, industry, and commerce turned all in favor of centralization, and the second half of the century was occupied in the struggle against the old and the new forces that maintained centralization. Of these more recent developments we must speak later (Chap. 32). One blazing truth stands out: centralization can be a democratic as well as an undemocratic device, for the people who make the laws in a democratic state may demand services of government which can only be produced by centralization.

*The Caesar Complex.* The memory of power of the central executive and its former pretensions has caused French Parliaments to be highly jealous of the modern executive. It has been impressed upon them that the central power was once an entirely unrestrained authority, that its acts were arbitrary, that it is still a restive entity animated by the old spirit, and that the old spirit functioned in such wise that only a bloody but glorious Revo-

lution could expel it. The means is thus identified with the end; and though the end was the real vice, it has the vicarious force of causing hostility to the means. And thus at every point these two, Parliamentary and Official, find themselves in contrast. It is a sheer reaction from an historical situation, one of those undue reactions of which the history of government is almost entirely composed: an unfortunate quality of human behavior but one which human beings, who live by exaggeration, will take centuries to grow out of; on a large scale it is what the uncontrolled reflex is in simpler behavior.

#### CORRUPT METHODS OF RECRUITMENT

THE centralized methods of the *ancien régime* might have been supportable by the country if the officials had been competent, if the career at least had been open to the talents. But the career was not open to the talents, and very little heed was given to the problem of competence. This is a very striking difference from Prussia, and the advent of Revolution in France and the slow progression from autocracy to constitutionalism in Germany are in part direct effects of the difference in the quality of their respective bureaucracies.

*The Venality of Offices.* In France until the Revolution, almost every office, central and local, excepting the dozen or so highest offices in the kingdom, were attainable only by private purchase, gift, or inheritance. All public offices, that is, were a species of private property, and a voluminous jurisprudence governed their transmission. This jurisprudence is at pains to explain that the offices which were vendible and hereditary were of a two-fold nature: they were at once a property and a public function. Anybody, then, who desired to acquire an office had to purchase the property from the owner and be installed in the function. The latter gave the Crown the opportunity of demanding guarantees of competence, but in fact the Crown and its officers through whose registers the transaction and the installation passed did not demand such

guarantees: they were gallantly content with fees, bribes, and other favors, personal or procured. Not every one with the price of an office was legally entitled to it, but in practice, every one obtained it at some price. Ability, however, unsupported by money or family, was almost certain of exclusion from public office. The system, in short, was venality tempered by favoritism.<sup>25</sup>

Venality began in judicial offices, was extended to financial and other officials, and in 1680 was extended to municipal officials. By the time of the Revolution there were 300,000 offices of this kind, equivalent, at a guess, to the number of all officials, central and local: that is, the judiciary, central and local (all the members of the bench and bar of the *Parlements*); the intendants; the financial, road, forestry, postal, and customs officials; the queerly-named officials to whom the protection and regulation of industry and commerce had given rise (like the gaugers of wine, the computers of hay, the salt salesmen, the coal controllers, the sealing-wax warmers, the measurers of cloth, the judges of leather, etc., many, indeed, being quite private employments); and the mayors, lieutenants of mayors, and police.<sup>26</sup>

What was the history of this singular institution? It was little more than a fiscal expedient adopted by impecunious kings and ministers, and so easy a means of raising money that once it was begun its evils were never for long obstacles to its extension. Just as some modern countries when hard pressed have inflated the currency as an indirect method of taxation, so the number of offices of finance was inflated and sold, the revenue and the commission from their sale being afterwards paid for by the people at large who were taxed to pay the salaries. The practice had begun as an occasional and unwelcome expedient in the fourteenth century, but in Louis XII's wars with

Italy, financial pressure compelled a large-scale operation of this kind: the exception now became the rule.

Prices rose, but there was a frantic buying. Ministers made the most of their financial discovery. As it soon became too difficult to invent new offices, the old ones were doubled or trebled—that is, divided up among several holders, who exercise their functions in rotation, or who did what the seventeenth and eighteenth centuries were too fond of doing, employed a humble subordinate to carry them out. Loyseau explains this eagerness to buy offices as arising from ambition which had engendered an *archomania* (or mania for office) which caused people to hurry to obtain them. In Loyseau's day a common proverb was that "there are always more fools than situations!"

Offices were sought, then, with a frenzied energy, and they were created with cynicism. Desmarets, one of Louis XIV's Comptroller-Generals, had proposed to the King the establishment of some quite futile offices, and the latter asked who would ever consent to buy such situation? "Your Majesty," replied Desmarets, "is forgetting one of the most splendid of the prerogatives of the Kings of France—that when the King creates a job, God immediately creates an idiot to buy it."<sup>27</sup>

The effects upon the administration of France were mixed, but the bad easily outweighed the good. No regard was had to competence in the vast majority of the cases. The law provided for an inquisition into the capacity of the candidate which was supposed to have reference to his character, his age, and "sufficiency": that is, in the case of officers needing a legal training, their legal knowledge, and in the case of the financial officials, their ability to cover any loss. All these things were neglected. The legal companies examined the legal officers: it was a farcical procedure. Only one rule of exclusion was practiced: orthodoxy to the Catholic, Apostolic, and Roman faith. In the offices nearest to the king, capacity as he or his mistress judged it was important, and it

<sup>25</sup> This is described and analyzed in Louis-Lucas, *Étude sur la Venalité des Charges et Fonctions Publiques depuis l'Antiquité Romaine jusqu'à Nos Jours* (Paris, 1883), 2 vols.

<sup>26</sup> Louis-Lucas, *op. cit.*, II, 30, footnote.

<sup>27</sup> *Idem.*

sometimes occurred that the king would find the means for the purchase of an office. A vast mass of talent was thus excluded, while there was no regulation of entry other than ability to purchase. The numbers of officials bore no scientific relationship to the amount and kind of work to be done; there were too many as a rule, and they often held office for only a short time. It was impossible for the Crown to exert any effective pressure upon them through a hierarchy, since each, having purchased his office, stood in a kind of independence to those above him. None of the devices which the nineteenth and twentieth centuries have found absolutely indispensable to the maintenance of an efficient administrative service could possibly come into being in such a system. There was an untrained, unregulated, and uncontrolled mass of people, to whom, above all, the function was a private property to be used as a means of personal power and profit by fees and bribes. The *Pot-de-Vin* is written large all over the history of France.

This system suffered from the same fault which private industry and commerce of the nineteenth century and of our own day exhibit: services were rendered for profit unequally—the best to those who could afford to pay for them, not to those who most needed them. Montaigne, whose father bought him a councillorship at the age of twenty-three, said: <sup>28</sup>

There is nothing more barbarous than to see a nation where, by legitimate custom, the function of judging was sold, where judgment was bought for cash down, and where justice was refused to those who could not pay . . .

The venality of offices gave rise to yet another evil. It encouraged the formation of an official caste. On the face of it, this appears unexpected, since money could always penetrate into the phalanx of official positions, but, in fact, fortune goes very largely by bequest within families, and one generation which possesses privi-

leges is always in a good position to come upon opportunities for its children. The office holders thus became a caste ringed round by money and privileges. The whole body of office holders was divisible into four classes according to the quality of ennoblement and privileges attaching to the office: (1) The highest and hereditary nobility, with its exemptions from taxation, was conferred upon the most important officers—the immediate advisers of the Crown and its governors and lieutenants in the provinces. (2) A second category (councillors of the *Parlements* and other courts of justice, and the high accounting officers) obtained simple ennoblement which did not pass to descendants unless the officer died while in possession of his office or had not resigned it until after twenty years of possession and service. (3) A lower category of offices conferred personal nobility; these gave noble pre-eminence but not nobility, and were not transmissible. (4) Lastly, there were offices which did not confer nobility of any kind, but only some of the immunities and exemptions enjoyed by the nobles—supplements, virtually, to their salary, such as exemptions from the *taille*, of the *tutelle*, from collectorship of the *taille*, etc.

All this nobility and seminobility felt themselves part of a class with interests and aspirations other than the rest of the people. The result was administratively bad. A corporative spirit grew up which made this class resist reforms and caused the higher officials to protect the lower from punishment, for "short, medium or long, the robe covered and set apart a *gens togata*, which much more nearly constituted an 'order' than the nobility." Two other effects were disastrous: the people could not but feel that this caste had nothing to do with them except to exploit them, and was therefore to be obeyed only in so far as coercion was inescapable; and a continuous temptation existed to those with the means to step into the official class and there seek distinction.

There are those, however, who can find something good in the worst institution,

<sup>28</sup> Pierre Clement, *Études Financières* (Paris, 1859) p. 13—"Montaigne Citoyen."

and the stream of comments on venality has left a certain deposit. (1) It enabled the Third Estate to acquire office,<sup>29</sup> whereas, presumably, without such a mode of recruitment the public services would have been exclusively occupied by the old nobility and their nominees. The parents of the Third Estate gave their children a good literary education in the hope that they might one day occupy high office. (2) The offices were taken out of the sphere of politics which, until 1789, were rotten with religious and factional intrigue. Purchase and heredity contributed to the establishment of families in whom professional traditions of science and honor were engendered and maintained, and this was far preferable to appointment by court favoritism. (3) Finally, it was argued that venality produced the nonremovability and official independence of legal officers—an extremely important gain at a time when the monarchy was molding everything, provinces, municipalities, to its purposes—it was a refuge from the rule of the arbitrary. It was apparently on this ground that Montesquieu, in his *Esprit des Lois*, finally favored venality.<sup>30</sup>

There were occasionally serious suggestions to abolish the system—mainly under Colbert—but financial pressure and the question of compensation defeated all projects. The Revolution made a complete and indiscriminate suppression of the institution, and it required four hundred decrees to accomplish this.

**Favoritism.** Government abhors a vacuum, and when the laws deliberately create such a vacuum by a revolutionary break, a new principle must be set up. The Declaration of Rights of 1791 established a new principle. Article 4 says:

All citizens, being equal before it [the Law], are equally admissible to all public dignities, situations, and offices, according to their capacity, and without any other distinction than that of their virtues and their talents.

The vacuum is, however, not properly filled until a method of measuring and choosing "virtues and talents" has been devised and put into operation. Such a method ought to be determined by a calm and mature consideration of the nature of the state, considered not as a static entity whose life history has ended but as a dynamic condition. But the practical conditions of a revolutionary period do not allow of such foresighted and wholesale plans: there are urgent and immediate contingencies upon whose solution hangs life or death. The vacuum is, therefore, filled by a rush of that very spirit which made a revolution.<sup>31</sup> It is natural that the revolutionist shall judge virtue and talent roughly and readily as whether you are for or against him: indeed, in a revolution people choose themselves. Also in a counterrevolution. And as revolution and counterrevolution succeeded each other at intervals until 1870, it is not surprising that no careful attention was paid to the problem of recruitment, and that republics and empires and consulates and kingdoms relapsed not into systematic venality but into systematic favoritism. The factions and the parties in French political life after 1789 were unrestrained by any fine tradition to the contrary. Favoritism chased venality out of France and reigned in its stead until recent years. And as nomination was abandoned to the will of the prince, so was promotion and dismissal.

**Survey.** The French have, therefore, an experience of administration which has made them unfriendly toward it. When their kings were administratively active, they suffered from his assistants; when those kings were libertines and occupied themselves in war or court intrigues, the people paid the price of a machine which they detested. At a time when Prussia was rising to European im-

<sup>31</sup> Taine's metaphor is different: *Régime Moderne* (Paris, 1906), Vol. I, p. 194: "By an amputation which is radical, complete, and extraordinary and to which history does not measure an equal case—with the temerity of the theorist and the brutality of the *carabin*—the legislator has extirpated the old institution as far as he was able . . ."

<sup>29</sup> A. Thierry, *Essai sur l'Histoire de la Formation et des Progrès du Tiers État* (Paris, 1853), Chaps. IV and VII.

<sup>30</sup> Book V, Chap. 19.

portance by the forceful and able administration of a succession of particularly brilliant monarchs, the administration of France was systematically ruined and its name and actions delivered over to scandal and mockery by kings of weak will, debauched lives, and a juvenile taste for the glories of war. Thus did the accident of birth and the nature-given geographical situation which produced costly wars conspire with human nature to erect a polity at once centralized and venal.

The shapes which the central administrative departments successively took are not of much importance; as everywhere else they began as an amalgam, then were sorted out first by area and later by cognate services and swayed between control by single secretaries of state and boards.<sup>32</sup> Higher, perhaps, than in other countries was the importance of the Comptroller-General of Finances, and this was because the finances were in a

chronically pathological state and everything was subordinated to the requisition of a large revenue.<sup>33</sup> Ministers came and went in remarkably quick succession.<sup>34</sup> In the story of Necker's administration and downfall, and in that of Turgot, the whole natural history of the *ancien régime* is written. There seemed neither energy nor stability at the center.

The organization of the nineteenth century was not, then, written on an entirely clean sheet. The gullies could still be seen in spite of attempts at erasure, and the pencil was apt to slip into the ancient grooves; or their appearance would so terrify the legislators that they would write what a calmer mood could not commend.

<sup>32</sup> Cf. Necker, *De l'Administration des Finances*; and de Maré, *Le Contrôle des Finances* (Paris, 1928), Vol. 2, Chap. XII.

<sup>34</sup> In the reign of Louis XIV the controllers served an average of eleven years each; in Louis XV's regency five years; in his own reign three years; and in Louis XVI's reign of eighteen years, they served an average of one and three-quarters years.

## *England: Origins, Reform, and Recruitment of the Civil Service*

### ORIGINS

IN what respects does English differ from Continental administrative history? The ordinary English view of today is that England was saved from bureaucracy and centralization, with which the Continent is afflicted, by the innate individualism of its people, their stout resistance to the interfering propensities of all government, and their ability to adventure and attain their own well-being by independent enterprise. But these words hide more than they reveal. Perhaps the real cause of freedom from bureaucracy is religious and social indifference and material acquisitiveness. Let us turn from the hypothetical to that which is historically well founded.

The first striking feature in English administrative evolution is the small amount of conscious—or at least formal—thought bestowed upon the subject until the end of the eighteenth century. It is impossible after the reign of Henry III and his immediate successors to find a person of the mental caliber and strength of character of Richelieu, Colbert, or Louis XIV in France, or the Hohenzollerns of the late seventeenth and the eighteenth century in Prussia, devoting themselves with such ardor to the creation of a complete social scheme and an administrative system to support it,<sup>1</sup> for Thomas Crom-

well, Francis Walsingham, and William and Robert Cecil were restrained by imperious masters and a restive Commons. Whatever of administrative inventiveness there was went mainly into the organization of the Treasury, and the Chancery, the development of the Royal Council, and only lastly the Secretaryship of State.<sup>2</sup>

tional history, since the administration revolves immediately around the king, himself an active administrator at the center. For this history see W. Stubbs' *Constitutional History*, 5th edition (Oxford, 1891-96), and C. Petit-Dutaillis, *Studies and Notes Supplementary to Stubbs* (Manchester, 1930).

<sup>1</sup> The early history of administration is, of course, hardly distinguishable from constitu-

English needs were not those which required for their satisfaction the extreme centralization and hierarchies of the Continent. Before the sixteenth century the modern state had hardly yet arisen out of feudal organization, and this provided for so much of the official work in its own peculiar fashion, in the manor, the corporations, and guilds, and by the clerks, the Church-learned dignitaries, and minor writers. The Chancellor and the Treasurer and the royal clerks who surrounded the king were his private servants. They did not come under external criticism until much later, since their work was at first so slight and their power so unpolitical that it did not cause public anxiety. When, in the sixteenth century, the nation became conscious of its identity, international and domestic, and the Tudors had raised the power of the Crown to a great height, the monarchy and by consequence its ministers were faced by a restive Parliament at the center of administration and by about two thousand justices of the peace and thousands of parishes at the extremities.<sup>3</sup> That is, at the center its pretensions and plans were subject to a valid external check, and the privy councilors in Parliament were harassed and checked when they attempted the high hand. Nothing like such a powerful and authoritative control over the administration existed elsewhere in the Germanic states or in France. In this respect England was a century and a half in front of them. This was a very important factor for the extent to which it limited the size, pretensions, and quality of the administration. In the localities there was a ready-made administrative apparatus which cost little or

nothing.<sup>4</sup> When men like Burghley—no longer royal servants and clerks, and since about 1601 given the significant title of Secretary of State—began to pursue a positive state policy in relation to industry and commerce, they relied upon this local machinery. But what costs nothing usually gives nothing after the waning of the first excited patriotic impulse, and parliamentary Colbertism as it has been called, or mercantilism, petered out and ultimately did more harm than good because the administrative instruments indispensable to state activity had not been consciously devised to fit the law to be applied. This lazy hand-to-mouth method is apparent in every branch of national administration. The ends were desired, but not the means which alone could have attained them. An attempt was made at the end of the sixteenth and the beginning of the seventeenth century consciously to invigorate the administration of the Poor Law (which was the core of a local administration), and when it failed, the sun set on such efforts at administrative efficiency, not to rise again for two centuries. Continental thinkers have expressed their admiration of England's freedom from bureaucracy, and this admiration has been focused by the works of one great worker—Gneist—upon English local administration, the nature of which in the seventeenth and eighteenth centuries preserved the country from centralization.

The administrative apparatus of England from the middle of the sixteenth to the end of the eighteenth century worked so badly as to call forth law after law from the central authority, each complaining that the preceding one had not been properly executed. The preambles to these laws were little essays in administration, compounded of complaints, scolding, and exhortation. It is impossible to estimate in quantities the financial loss and the physical and spiritual misery suffered by the people of the parishes and the towns of England because there was

<sup>4</sup> Cf. the studies of local administration by Sidnev and Beatrice Webb.

no central officer to watch and control the behavior of the local authorities. It was enormous and terrible. However, the hierarchical, centralized, overdisciplined system of Prussia was avoided, and the detailed *étatisme* and organized venality of France found no place. Instead much made for the development of administrative self-reliance.

The many ambitious laws made by Parliament were carried out not by the professional agents of the central authority, but by the local gentry of the upper and middling class. These were unpaid and nonprofessional. No qualifications of literacy or study were required of them. The conscientious among them could acquire the modicum of law necessary for their decisions from the justice's manuals and the customs of others. Their reasoning and judgments were not directed by authority; no excessive numbers of regulations or minutes hampered them; and no representative of the central authority they exercised appeared unstrained and natural to the mass of men, for the justices of the peace occupied their positions in virtue of their local economic fortune and social status. They were the landowners and therefore, in an agricultural society, the hereditary rulers. Their acres prevailed. As neighbors their rule was accepted with the minimum amount of questioning we accord to one of our own group. It is the "outsider" whose presence raises questions and whose pretensions conduce to discussions of their justification; the "outsider" it is who provokes the democratic *quo warranto*? The justice of the peace was not one of these, interfering in the name of the king or the queen or the state, but simply settled the everyday difficulties of two or three villages—and in partnership with his fellows, at quarter sessions, settled more important questions of order, roads and bridges, the well-being of the poor, prices and wages, and such-like affairs for the benefit of the country. Quarter sessions had a few officers—but for the rest, the everyday work of administration was done

by even more immediate neighbors of the governed, the parish officers.

All these officers were directly of the people, serving for their term compulsorily and often unwillingly. They knew vividly, and in detail, the nature of the life of their community, and when they desired, did not find it difficult to distinguish the circumstances of one person from the other. Moreover, the people knew them just as well. Accommodation of governors and governed is of the first importance in successful and liberal administration; and this local mutual knowledge rendered easy of attainment. The opinion of the governed promptly and continuously influenced the governors—sometimes too easily as in the removal of nuisances, the relief of the poor, or the reduction of assessments for rates.

This was clearly a system in which the habit of self-government was fostered, at least for the aristocracy and squirearchy; here the legend of immemorial right of local government could develop vigor and stamina. The sense of freedom from external direction and control was not disturbed by the actual machinery which brought the central government and the local officials in town, county, and parish into the semblance of loose coherence. It was nonbureaucratic—that is, it was not exercised by officials trained for work in a particular department of state with habits of mind formed by professional activity in those departments.

The method of administration was largely judicial, that is, it was exercised at the level of the county and its districts by justices of the peace, who supervised and corrected *post facto*, rather than anticipated and intervened before and during the event. This is an important distinction between the administration of the nineteenth and twentieth centuries and the methods of the eighteenth. The judicial is after the fact, corrects and applies remedies; the administrative implies the appointment of an official to anticipate the future, to watch whether appropriate or erroneous administration will occur, with the responsibility for setting rules designed to guide action and

avoid error, and with personnel having continuous responsibility to intervene to secure that the rule work as previously designed.

Yet the justices were on the local spot, and their wide acquaintance with men, interests, and policies enabled them to give good common-sense directions even if they were only remedial and of benefit in the future, and as persons, they influenced day-by-day administration. The method of keeping the local parochial officials up to a tolerable standard of duty was to "present" them or the parish as a whole before the judicial sessions of the county, that is, to charge them there with nonfeasance or malfeasance or negligence, and the rest. They would be fined if remiss in their tasks of, for example, apprenticing a pauper child, assessing rates, neglecting to remove nuisances (health hazards), not keeping up the roads and bridges, or not fixing the scales of wages and prices and conditions of apprenticeship. When the parties appealed, as they might, the central authority's judges on circuit gave judgment: and this settled the lines along which the matters in dispute were to be administered in the future: in reality a rule of administration was established. This soon found its way into the justices' manuals. The central judges took back the information they had locally obtained and in the Privy Council their views were shaped into a new, amending law. A kind of local, part-time inspectorial system was established in the institution of the common informer. In many cases, any person informing of a violation of the law received a share of the fine if the violation were established in court. This rudimentary detective arrangement no doubt kept officials rather more alert than they would otherwise have been, and brought more cases of maladministration to the courts than would otherwise have been corrected. Since all concerned—official, informer, and justice—were local residents in a land of villages, movement away from which was very rare, the system had its administrative merits. But it would have been surprising if the local situation

was continuously encouraging to informers.

An attempt was made between 1587 to about 1640 to institute stronger, directive, administrative control from the center.<sup>5</sup> It failed mainly because the onset of the civil war broke the continuity of central authority. And the outcome of the civil war was to vest local government in the hands of the substantial families of the localities until far into the nineteenth century.

The country was, in fact, more concerned in the seventeenth and eighteenth centuries to control the executive as a policy-making body than as an administrative organization. It was not anxious to seek to tap the sources of efficient government so much as to limit the power to govern without parliamentary consent. The Crown was not interested especially in highly efficient administration: all it sought was the right to appoint or give to its ministerial friends the right to appoint and employ in freedom from parliamentary control. Its interest was patronage.

Thus, while the Continent in these centuries elaborated an administrative system centralized and militarized or venal, and in Prussia professionally schooled, England devoted her energy to the perfection of constitutional restraints on the Crown. Prussia and France sought to flourish by "inner colonization," and so widened the scope of domestic government and bore heavily on the people through officials. England's eyes were directed across the seas to foreign colonization. The former exploited the people at home: the latter, far-away peoples. So England was spared the full rigor of domestic tyranny by officials.

This noncentralized, nonbureaucratic, local-gentry system of government was in part made possible by certain accidents of geographical position and historical fate. The comparatively unchallenged supremacy of a single political authority was accomplished by the Norman con-

<sup>5</sup> Cf. S. and B. Webb, *English Poor Law History* (London, 1932), Part I, Chap. 11.

## REFORM: FROM PATRONAGE TO OPEN COMPETITION

quest—five centuries before such a boon was gained by either Prussia or France, even if two or three hundred years were still needed to consolidate what in 1066 had been a first surge of centralizing authority. In geographical situation England was favored also: insular and isolated, invasion became difficult once a navy had been built for defense. It did not need to insist, as Prussia and France were obliged to, that the country, with strong neighbors not many miles distant, must be one and indivisible. It was not necessary as the price of survival to knit the country together with a thread of steel whose ends were in the hands of the central authority. Conscription of neither persons nor localities was necessary. The sea saved England for long from the administrative and despotic centralization imposed by the Continental state's addiction to the *raison d'état*. Then, also, England, through distance, was not pervaded, like the Continent, by the authoritarian influence of Rome either in her legal structure and spirit or in her religion.

Thus, free and liberal in her local administration (if anarchic and not altogether efficient, just, or charitable), and early in her rejection of excessive state activity at the center, England slid into the industrial era, when revolutionary changes had to be made to refit the administrative structure and methods to new compulsions and new opportunities. She did this, having lost the American colonies through patronage appointment of incompetents at home and to colonial offices.<sup>6</sup>

### REFORM: FROM PATRONAGE TO OPEN COMPETITION

THE government departments are largely the creation of the last hundred years or so, and they have increased in numbers and personnel particularly since about

1870.<sup>7</sup> This is easily understood. The Industrial Revolution compelled society to equip itself to meet new material obligations on a vast scale. Health, poverty, education, communications, trade, agriculture, colonies, manufactures—all now disclosed elements which demanded large-scale regulation and compulsion. The political philosophy of the utilitarian school and the Tory humanitarians resulted in inquiry into these elements and in adoption of the necessary measures. At first only the dead environment—drains, buildings, factories, roads—was to be altered, but it soon began to be seen, most vividly in the sphere of public health, that men were no less important parts of each other's environment. Consequently state activity spread wide and deep. Expenditure grew and the numbers and efficiency of civil servants increased. From 1832 onward the numbers grew rapidly, and there is never a retrogression worth remark. But the expansion is not at a regular rate; it occurs by sudden spurts which may be correlated with the state's legislative and administrative assumption of new duties, or with the expansion of already established services. The figures in Table 23 were obtained from Parliamentary returns up to 1832, and since then from the censuses for England and Wales. The numbers include all administrative and clerical staffs, messengers, and postal officials; they exclude industrial staffs for which there are no facts. The different bases of the censuses and the paucity of explanatory comment on the civil establishments make it impossible

<sup>6</sup> Cf. L. B. Namier, *The Structure of Politics at the Accession of George III* (London, 1929), 2 vols.; and G. M. Trevelyan, *Early History of Charles James Fox* (London, 1880), Chap. III.

<sup>7</sup> Thus the Ministry of Agriculture was established in 1889; the Development Commission, 1909; Board of Education, 1899; the Local Government Board (now the Ministry of Health), 1871; the General Register Office, 1836 and 1874; the Ministry of Labour, 1911; the Department of Overseas Trade, 1917; the Department of Scientific and Industrial Research, 1919; and the Ministry of Transport, 1919. Every department has been extended by tasks unimagined by the generation which died around 1900. In and after World War II came such departments as the Ministry of Fuel and Power, the Ministry of Town and Country Planning, the Ministry of Civil Aviation, the Ministry of Supply, Ministry of Food.

# ENGLAND: ORIGINS, REFORM, RECRUITMENT

to offer more than the crude figures given, but they show the striking increase, especially since 1881.

We are served today by an administrative machine which only in the last years has been converted from a planless improvisation into a well-ordered engine<sup>8</sup> both powerful enough and sensitive enough to satisfy modern needs. The

the years 1689-1855; the second commenced in 1855. In the first period, attention was not directed toward improving the quality of the officials: the quest was not for aptitude, but mainly for the political purity of the House of Commons and the electorate.

1689 to the Nineteenth Century. The revolution of 1689 had given Parliament

modern history of the British civil service begins in 1855. Up to that time, the offices of state fell into the hands of the ruling political party and were used to bribe and reward their followers. There were two periods of occupation with reform of the civil service. The first covered

the supremacy over the Crown, and to safeguard this sovereignty Parliament determined to exclude from the right to its membership any official holding a place of profit under the Crown. The civil offices were thus a pawn in the struggle between Parliament and the king. In this way the mass of officials were and still are excluded from Parliament. Exception was made, of course, and still continues, of

<sup>8</sup> Cf. Sir Warren Fisher, *Evidence*, Royal Commission on the Civil Service, 1929, p. 1267, paras. 3-6. Memorandum.

the ministers of state. They are the link between Parliament and the administration. Acts of Parliament went even further in the attempts to exclude office-holders from politics. In 1712 postal officials of higher rank were forbidden to take any part in elections, but the majority of lower officials were still allowed to vote. In 1782, the very apogee of the corrupt sale and gift of offices, the campaign of Edmund Burke for economical reform obtained a partial success in a statute of that year. The Act of 1782 disfranchised customs, excise, and postal officials, and this prohibition was maintained until the year 1868, but entry to these offices was still used as a political favor.

It is worth pausing here a moment to consider Burke's views. He was, perhaps, the first statesman to see the problem of the civil service as one of the efficiency of the administrative branch of government. His great speech of February 11, 1780, was entitled, "On Presenting to the House of Commons a Plan for the Better Security of the Independence of Parliament and the Economical Reformation of the Civil and other Establishments."<sup>9</sup> He said that uppermost with him

was the reduction of that corrupt influence, which is itself the perennial spring of all prodigality, and of all disorder; which loads us more than millions of debt, which takes away vigour from our arms, wisdom from our counsels, and every shadow of authority and credit from the most venerable parts of our constitution.

But he spent most of his speech on proving to the House how all the departments suffered from "the grand radical fault: the apparatus is not fitted to the object nor the workmen to the work."

*Nineteenth-Century Criticism: to 1855.* As in the history of local government and of most other English institutions of this period, there was a silent massing of the opposed forces of Utility and Patronage. We must not forget in this period the pioneer work of Jeremy Bentham. In his

*Official Aptitude Maximized, Expense Minimized* (first published in 1830, being a series of papers composed between 1810 and the later year), he lays down the general basis for a reform of the corrupt officialdom and rank patronage of his time. In his *Constitutional Code* (Book II, Chapter IX, section 5 *et seq.*), he constructs in detail a code of official appointment and pay which shows his inventive mind at its best. Readers may well turn their eyes to this fine piece of reasoning, which anticipated more than all of our modern methods of civil service recruitment and other conditions, and they cannot fail to admire Bentham's marvelous power of mind, though they may smile at some of the grotesque practical suggestions which follow from his philosophy of human nature.

In 1849 the Permanent Secretary of the Treasury, Sir Charles Trevelyan, pointed out the defect of the civil service of his day: it was overstaffed, inactive, and incompetent, and people commonly considered the civil service as the last chance of a livelihood for young men who were too stupid to be successful in the open competition of the professions outside and for the old who had already failed. A rule had been made by the Treasury in 1840, for all departments, that "clerks appointed to the principal offices should possess a competent knowledge of book-keeping by double entry"—but it was obeyed by nobody. Those people who made the service a profession were habitually cheated out of promotion to the highest offices by the nominees of the powerful. But England was spared the great defect of the American "spoils" system—the rotation of offices—the product of a democracy oversuspicious of its executive, possible in a system where the executive has a fixed term of four years but not in a system of cabinet government where Parliament can be dissolved and ministers dismissed at any moment.

Reform was undoubtedly caused by the pressure of business on the civil service and by the mental energy of the utilitarian philosophy. The latter was already having its effect not only upon every as-

<sup>9</sup> Edmund Burke, *Works*, World's Classics edition, Vol. II, p. 303 ff.

pect of government, but even upon the old universities which were in the 1830's and 1840's awakened from slothfulness, their endowments for scholarship now being competed for by examination. Indeed, Macaulay, the future reformer of the civil service, was a Fellow of Trinity by competitive examination. It was the age of the machine and engineering triumphs, and the civil service was perhaps now in men's minds taking on the aspect of one machine among many, to be renovated according to new needs. From the old system England was delivered by the invention of the method known as "open competitive examination" as a test of fitness to enter the service.

The germ of this idea was generated in the reform of the English administration in India, and was carried out in the Charter Act of 1833. A special school, Haileybury, where Malthus had been a master, had been established in 1813 for training those nominated to be Indian civil servants, and entrants to this had to undergo a difficult examination. The training was educationally of a high grade, and the discipline strict. But patronage still played a large part in appointments and entry to the school. The act of 1833 prescribed that, in future, four candidates were to be nominated for each vacancy and that the nominees were then to compete in "an examination in such branches of knowledge and by such examiners as the Board [of Control] of the Company shall direct" (section 105).

Yet this Indian reform issued from more general causes and together with other like reforms. A new class, the upper commercial and manufacturing men, now entered politics, especially with the Reform Act of 1832. They were accustomed to business efficiency, to the rational fitting of management and methods to purpose, and to strict account-keeping. Furthermore, local police and health and poor-law assistance administration had been reformed in 1829 and 1835 under powerful utilitarian influences. Colonies had been lost through incompetence. Judicial relics of authoritarian and barbarous penal ages were under attack by

the new men who argued that men were good, if not free altogether from sin, but that institutions as they were corrupted them.<sup>10</sup>

In 1853 the charter of the India Company came before Parliament for revision, and Macaulay, brother-in-law of Trevelyan,<sup>11</sup> well-versed in Indian affairs and English university conditions, secured the complete abolition of patronage and the acceptance of the principle of open competition of all comers. It is important to appreciate the character of Macaulay's suggestion, for it has dominated the English theory and practice of recruitment and promotion until today, in the Home Office as well as the Foreign and Colonial Services. The essence of his argument is to be found in this part of his speech to the House of Commons (June 23, 1853):

It seems to me that there never was a fact proved by a larger mass of evidence, or a more unvaried experience than this: that men who distinguish themselves in their youth above their contemporaries almost always keep to the end of their lives the start which they have gained.

In July, 1854, Macaulay was called upon by Sir Charles Wood, Chancellor of the Exchequer, to head a committee of distinguished men (including the principal of Haileybury College, Benjamin Jowett, then tutor and later master of Balliol, Oxford, and Sir George Shaw Lefevre, who had had long administrative experience) to report upon the recruitment of the Indian civil service. His scheme of open competition and his list of subjects and marks were accepted in their integrity. Open competition was thus invented and put into practice for India, and it became the pattern for reform of the civil service,<sup>12</sup> and later

<sup>10</sup> Cf. S. E. Finer, Jr., *Sir Edwin Chadwick* (London, 1949), Vol. I; and K. B. Smellie, *A Hundred Years of English Government* (London, 1934).

<sup>11</sup> Permanent Secretary of the Treasury.

<sup>12</sup> Later in his speech Macaulay cleverly analyzed the operation of competitive examinations: "Under a system of competition every man struggles to do his best; and the consequence is that, without any effort on the part of the examiner, the standard keeps itself

still a model for the United States and the envy of France.

Meanwhile an extensive and careful inquiry had been set into operation by a Treasury minute of November, 1848. It ran as follows:

The First Lord and the Chancellor of the Exchequer state to the Board [of the Treasury], that they consider it desirable that an inquiry should be instituted into the present state of the establishment of the Treasury, and into the arrangements and regulations for the distribution and conduct of the business, in order that such changes may be made as may be required to secure the highest practicable degree of efficiency, combined with a careful attention to economy, etc., etc. . .

Lord John Russell was then prime minister, and Sir Charles Wood the Chancellor of the Exchequer. The inquiry into the various departments was directed and in part conducted by Sir Charles Trevelyan, who was later joined by Sir Stafford Northcote. They were assisted by one or more members of each department examined. The reports cover about 450 pages, including the general report by Northcote and Trevelyan on "The Organization of the Permanent Civil Service." It is interesting to notice that the term "civil service" in reference to the home establishments was now used for the first time. The report was issued in November, 1853, together with an opinion upon it by Benjamin Jowett, the

up. But the moment that you say to the examiner, not 'Shall A or B go to India?' but 'Here is A. Is he fit to go to India?' The question becomes altogether a different one. The examiner's compassion, his good nature, his unwillingness to blast the prospects of a young man, lead him to strain a point in order to let the candidate in if we suppose the dispensers of patronage left merely to the operation of their own minds; but you would have them subjected to solicitations of a sort it would be impossible to resist. The father comes with tears in his eyes; the mother writes the most pathetic and heart-breaking letters. Very firm minds have often been shaken by the appeals of that sort. But the system of competition allows nothing of the kind. The parent cannot come to the examiner and say: 'I know very well that the other boy beat my son; but please be good enough to say that my son beat the other boy' " (*Hansard*, Series 3, Vol. CXXVIII, pp. 754, 755).

Master of Balliol, Oxford, and collaborator with Macaulay in the Indian reforms. About forty other distinguished people in public life and education were also asked for their comments, which were sent in between January and June of 1854, and the whole was placed before Parliament as the "Report and Papers relating to the Re-organization of the Civil Service." The plan was greeted by John Stuart Mill as "one of the greatest improvements in public affairs ever proposed by a government." This improvement consisted of that which Macaulay's Committee on the Selection and Training of Candidates for the Indian Civil Service was at about the same time recommending for India. It was the abolition of patronage and the admission of people into the service at prescribed ages and by means of competitive examination. Two other principles were laid down. The commissioners recognized that a clear distinction could be drawn between the intellectual and routine work of the service, and demanded an appropriate division of labor and a separate type of examination for each. This involved classing civil servants—a problem which has never ceased to give trouble, and which has never given complete satisfaction.

A further point in these recommendations calls for remark. Thinking mainly of the higher administrative posts, the commissioners laid down another principle, which still, but with some modifications, holds good in Britain, and distinguishes the British type of recruitment for that class from recruitment in other countries, notably France and Germany. The report was antagonistic to any technical preparation for the examination for such posts, for the commissioners had their eye upon the classical and mathematical education at Oxford and Cambridge of their day. They were impressed by Macaulay's argument that

men who have been engaged, up to one and two and twenty, in studies which have no immediate connexion with the business of any profession, and the effect of which is merely to open, to invigorate, and to enrich the

mind, will generally be found, in the business of every profession, superior to men who have, at eighteen or nineteen, devoted themselves to the special studies of their calling. Indeed, early superiority in literature and science generally indicates the existence of some qualities which are securities against vice—industry, self-denial, a taste for pleasures not sensual, a laudable desire of honourable distinction, a still more laudable desire to obtain the approbation of friends and relations. We, therefore, think that the intellectual test about to be established will be found in practice to be also the best moral test that can be devised.

Macaulay was so sure of his prescription of seeking for evidence of superior mind rather than specific information that he even ventured that the competitors could as well be examined in Cherokee or Iroquois as the European classics and that the test would be as valid for the administrative object of his search; not information, but mind: *non multa sed multum*, not many things but much.

The principles here set out still stand as the foundation of the English civil service. There have been modifications in the course of the ninety years since that time owing to the growth of technical studies at the universities, but to a large degree the general foundation of liberal studies remains. The "mere smatterer" is not wanted. Even today the study of the humanities and history, in their classic and modern shapes, is strongly believed to produce the best type of administrative officer.<sup>13</sup> This belief has much to commend it, for it is not the knowledge of school subjects that is wanted in the

administrator, but a way of thought, a mental and moral discipline. The aim is not to secure an expert but an administrative officer who is capable of becoming skilled by contact with his actual work and able to say at what exact point an expert shall be called in. The examinations demand an education which will produce candidates with the highest power of enlightened common sense.<sup>14</sup>

The outlook, power and quickness in comprehension, the gift of dealing with people, the readiness to take the initiative and to assume responsibility, are all in the main highly developed when the business to be transacted is seen by the Civil Servant against a background of other knowledge of the type through which the mind has become developed.

The highest class of administrative officers thus provided has gone under different names (e.g., the upper grade, the first division, the administrative class), but it has so far consisted of the pick of the Honors men in the classics, history, and science (including mathematics) courses at the older universities, with the bias on the two former. From the upper and higher middle classes of the country—the only ones until quite recently who could afford such an education—came generations of young men into the service who had precisely the liberal, literary turn of mind, without professional prejudices or bureaucratic pedantry, fitted to work hand in glove with the parliamentarian, to act unoppressively toward the public and smoothly direct the departmental energies. The composition of that class has since World War I been undergoing a process of change and so also the demands upon it of a new era in national life. To this I revert later.

The commissioners laid down certain other rules for efficient and convenient recruitment of officials. (1) All examinations should be conducted by a single authority standing entirely outside the separate departments. This would secure

<sup>13</sup> This statement is rather more true of the Committee on the Civil Service Class I Examination of 1917, than of the present policy of the civil service commissioners, which is to draw recruits from a large variety of schools. The bias of the Committee is shown in this representative extract from its report (Cd. 8657, 1917): "To teach the classical learning and develop classical scholarship there was at work in 1914 a great band of scholars equipped by the tradition, the organized learning, and the experience of four hundred years. . . A large proportion of the most able students have gone in the past to classics, and we cannot alter the natural habits, the prepossessions, and the system, that have caused the most gifted among literary students to follow the ancient studies."

<sup>14</sup> Lord R. B. Haldane, "The British Civil Service," in *Journal of Public Administration*, Vol. 1, p. 29.

effectiveness and consistency; and in this England, Germany, and the United States have followed much the same path, while France differs, having an examining authority in each department. (2) Examinations should be held at regular intervals and not for special appointments, which would conduce to making it known as an annual event to all potential candidates. (3) Successful candidates would be allowed to enter the departments of their choice in order of their place on the pass list (except since 1919 into the Treasury); not so in France or the United States. (4) There should be a period of probation before candidates were finally placed on the established staff.

Only part of the recommendations were carried into execution, and this, in the teeth of strong protest from the clubs, political and social, from politicians, and from everybody who had something to lose by the reform.<sup>15</sup> Macaulay, wandering into Brook's in March, 1854, found everybody astounded by Trevelyan's plans for the abolition of patronage at home. The storm from clubland almost swept Trevelyan, the Sir Gregory Hardlines of Trollope's *Three Clerks*, out of office. A remark made by the latter in 1875 (before the Playfair Commission on the Civil Service) is too interesting to put into a footnote; the italics are mine.<sup>16</sup>

<sup>15</sup> It is interesting to remember that Gladstone, who urged on this reform, did so on the ground that the higher classes would get administrative power. He believed, in 1854, that the aristocracy of this country were superior in natural gifts, on the average, to the mass, and that with their acquired advantages, their "insensible education," irrespective of book-learning, they were immensely superior. See the letter to Lord John Russell, January 20, 1854, in appendix to John Morley's *Life of Gladstone* (London, 1905). Queen Victoria was much perturbed by the suggested reforms and consented to them most grudgingly (*Letters*, February 7 and 17, 1854).

<sup>16</sup> *Parliamentary Papers*, 1875, Vol. XXIII, p. 100. It is remarkable that Trevelyan's services to the English government, at home and in India, have not yet received a mark of gratitude in the shape of a full memoir. The *Dictionary of National Biography* gives scant information about him. Born in 1807, at Linton, he was educated at the Grammar School,

I wish briefly to explain the circumstances which led up to the Report of Sir Stafford Northcote and myself on the organization of the Civil Service. *The revolutionary period of 1848 gave us a shake*, and one of the consequences was a remarkable series of investigations into public offices, which lasted for five years, culminating in the Organization Report.

*1855 and After.* By an Order in Council of May 21, 1855, the Civil Service Commission—the Central Board of Examiners—was established, with three members, with tenure during the pleasure of the Crown, "to conduct the examinations of young men proposed to be appointed to any of the junior situations in the Civil Establishments." The Commission would decide upon the age, health, character, and requisite knowledge and ability for the discharge of their official duties, and would give a certificate to this effect precedent to the appointment. The extent of the actual reform was this: (1) competition, not compulsory but permissive, was made the basis of appointments, but only throughout the ranks of the junior offices; (2) the power of appointment, following the issue of the commissioners' certificate, was still in the hands of the political heads of departments; and (3) a six-months' probation period was established. Abuses were thus limited, not entirely swept away. People of mature age who had special qualifications for a special post were not required to have the Commission's certificate.

It was twenty years before party attacks upon the work of the Commission ceased and it was left to work in peace.<sup>17</sup> The

and at Charterhouse, and thence proceeded to Haileybury. He entered the East India Company's Bengal Civil Service as a writer in 1826 and rapidly rose to high administrative office, his interest and endeavors being directed especially to public education and finance. In 1838 he returned to England, and from 1840 until 1859 he was assistant, and later permanent, Secretary to the Treasury. It was in this period that he helped so materially to bring about the reorganization of the Home Civil Service. In 1859 he returned to India as Governor of Madras.

<sup>17</sup> Cf. Anthony Trollope in an article in the *Fortnightly Review*, October 15, 1865: "We,

*Superannuation Act of 1859* supplied a sanction to the rules of the Order in Council of 1855 by providing that with certain special exceptions (professional officers of mature age being the most important), no person should thenceforward be deemed to have served in the civil service and to be entitled to a pension unless he should have been admitted with a certificate from the civil service commissioners.

In 1870 the Order in Council of June 4 completed the edifice thus created—its essentials were these. (1) The test of open competition was made obligatory practically throughout the service. (2) In the case of professional officers, the civil service commissioners might dispense with the examination test if they thought fit. (3) Certain officers appointed directly by the Crown (in 1914 these still numbered about three hundred, now considerably reduced) needed no certification whatever by the commissioners. (4) For certain situations, where the head of the department wished to dispense with an examination, the civil service commissioners could consent at the request of the head of the department and of the Treasury. This allows for the appointment of distinguished men from outside the service: a rare but valuable occurrence. (5) Lastly, but very importantly, the Treasury, which necessarily had powers of coordination and control permeating all departments because of its financial responsibilities and powers, was given special authority in the field of departmental organization. It was to approve the rules for testing candidates made by the Civil Service Commission and the departments, and the periods at which examinations should be held, the number of vacancies, and the grouping of situations to be competed for.

Your Majesty's Civil Service Commissioners, humbly offer your Majesty this our 'Tenth Annual Report.' Thus the dread document now under notice is commenced, reminding us with terrible earnestness of the quiet progress of the years. Here is their tenth report, and it was but the other day that we were discussing whether these Commissioners would ever have real existence!"

Since 1870 the development of the civil service has been marked by a series of thorough inquiries, always searching for improved efficiency. There were the Playfair Commission of 1875, the Ridley Commission of 1884-90, the Macdonnell Commission of 1910-14, and the Gladstone Committee of 1918, and all of these had before them the questions of classification, recruitment, and promotion, all interdependent parts of a single problem. It should be noted that there is no one general statute for officials as there is in the United States and Germany, and since 1946 in France. The foundations of the civil service are established, for the most part, by Orders in Council and Treasury Regulations and not by acts of Parliament. They were drawn up under successive cabinets in accordance with the recommendations of royal commissions; Parliament was not asked in any effective sense to ratify them, although it occasionally discussed their general character, and the Treasury and the Civil Service Commission were made the custodians of their execution.<sup>18</sup>

#### HOW THE SERVICE IS CONSTITUTED

THE civil service numbers 946,000, of which some 250,000 are industrial staffs. The remainder, nearly 700,000 nonindustrial civil servants, fall into the classes shown in the accompanying table. This number falls broadly into four great groups.

For all these classes save one, the principles of recruitment need little discussion here because their work is rather specific and this carries with it a concrete definition of the qualities required. So with executive work, though this is a little more difficult of definition than the other classes (and difficulties also are naturally experienced with some of the units in the inspectorate). So with the clerical, the typists, and the professional

<sup>18</sup> They are brought together—at least the gist and references thereto—in Royal Commission on the Civil Service (1929), Appendix to Part I of Minutes of Evidence. *Introductory Memoranda Relating to Civil Service* (63-149), 1930.

## HOW THE SERVICE IS CONSTITUTED

scientific and technical staffs, where a well-known course of training is provided by certain responsible bodies. Little attention will be paid to these or the industrial and manipulative staffs in the following discussion of recruitment; some attention is given to them in the sections on promotion and political and civic rights (in Chapter 34).

The class with which we wish mainly to concern ourselves here is the administrative class. In 1938 it numbered about 1500; at the peak in World War II it numbered about 4800; it will become normal at about 4000. This is the pivotal

amendments, and various kinds of public explanations. They are responsible for the control of staff, and for the execution of the work of the department.

Let us be very clear, before another step is taken, about what this administrative class truly signifies. It is a body of advisers, a "brains trust" to use an American colloquialism, the immediate aid of the minister at the head of the department. Each member of it, in his own way, at his particular level in the hierarchy, will contribute not merely information to the minister, but the ingredients of supreme policy. At the top the two or three

and directing class of the whole civil service. From the permanent secretaries down to the assistant principals they are responsible for transmitting the impulse from their political chief, from the statutes and declarations of policy, through the rest of the service and out to the public. They translate the wishes of the political side of government into workable and legally valid rules; and to that end they use scientists and lawyers as they are required. It is their business to gather together and weave the strands of science and law necessary to the determination of policy by the minister, and this may issue in the drafting of projects of law, amendments thereto, answers to parliamentary

men at the head of the department will be almost the minister's permanent other self.<sup>20</sup> This has already been emphasized in the chapter on the British cabinet. It cannot be re-emphasized enough. Their functions include making the department work in order that the laws may be carried out. But the average of about a hundred members of the administrative class at the head of each department are there to amass, develop, sift, improve, continue, and carry to minister after minister the knowledge of the function and policy of the department in relation to those of all other departments. They are the department's permanent wise men.

<sup>19</sup> House of Commons, Debates, December 17, 1947.

<sup>20</sup> This is described with masterly illumination by a distinguished former member of the class, Sir Henry E. Dale, in his *The Higher Civil Service of Britain* (London, 1941).

*The Educational System and the Civil Service.* It will already have been appreciated from the discussion of the relationship between the higher civil service and the universities that the two are consciously integrated. The same principle in general holds good for the various lower grades of the services: it is attempted to organize the various classes in such a way as to tap the nearest related level of the schools. This is a valuable procedure: for by arranging the age limits and the nature of the recruiting examination for the service, the pupils can, at their respective ages, look toward entrance into the service and use their ordinary curriculum so to do. Two things result: a regular expectation, for those who wish it, to enter the service at the completion of their curriculum, and therefore any special preparation in view of the examination: yet the pupils are not obliged, as in most other systems of civil service, to be especially coached in subjects the civil service wishes, yet extraneous to the ordinary curriculum. Hence, the schools need not, for vocational reasons, be compelled to go outside the subjects and the methods of teaching commended by reasonable pedagogy for students of the age group in question.

*The Local-government System and the Service.* Though British public administration is highly decentralized (though less so than in the middle or at the end of the nineteenth century) and though local government has large discretion over the bulk of municipal and social services, there is, through various devices, strong and effective central control, supported by grants-in-aid from the central authority equaling over fifty per cent of the local government expenditures, excluding the public utilities.<sup>21</sup> The organizing, regulating, admonitory, advising, scheme-sanctioning, auditing, and inspecting controls are administered by the central civil servants, and, in the higher range of policy and action, by the administrative class.

It must be remembered also that the nationalized occupations, though not under civil service, are yet directed and supervised at the top level by the minister at the head of the government department related to the nationalized industry,<sup>22</sup> and this means the administrative group at the head of the civil service.

#### HOW THE ADMINISTRATIVE CLASS IS CHOSEN

THE administrative class is open by competitive examination to men and women between the ages of 21 to 24. In 1925, the class was opened to women on the same terms as to men. As the age indicates, it recruits mainly from the Honors-degree men of the universities. This class is recruited also by promotion from the lower classes of the service, and those who are so promoted, as well as those who enter by examination, enter first the administrative cadet corps, called the junior grade, which serves as a training ground for their new duties. The numbers of such promotions are small enough to give a reasonably certain prospect of more responsible office later. From 1923 to 1935 the class was recruited to the extent of 278 by competition and 82 by promotion. The annual relationship of promotees to entrants is erratic. There is a probation period of two years, at the end of which there is either discharge or reversion to a lower grade if the probationer is unsatisfactory.

This class is the hub of the administrative wheel; on one side it is attached to the parliamentary machine, on the other to the executive arms of the administration. To it is imparted a direction and velocity by the minister; from it there emanates advice which has been drawn from the specialists, the inspectors, the experts, and vocational and social representative bodies. Its advice penetrates beyond the minister to Parliament and the public; into it, through Parliament and the minister, passes the force of public, which is transmuted by it into com-

<sup>21</sup> Cf. Herman Finer, *English Local Government* (fourth edition, 1949), Part IV.

<sup>22</sup> Cf. Herman Finer, "Planning and Reconstruction in Britain" *International Labour Review*, April 1948, p. 283 ff.

mands to the specialists, the inspectors, and all the classes of the service, in each department, in the local authorities, in the dominions and colonies and foreign countries, down to the final manipulative officer, to the end that the things politically willed shall actually be done. It is obviously the crux of the administrative side of government. As such it has naturally received and deserved much attention.

We are concerned with its duties and its preparation to fulfill them. The administrative class itself formulated its duties in evidence for the Tomlin Commission,<sup>23</sup> and it is reproduced in full, since incidentally it is itself a good example of the quality of the class.

The volume of official work which calls for decisions affecting the public is nowadays such that it is physically impossible for the Minister himself to give the decision except in the most important cases. And further, even when the issue is one which can and must be submitted for the Minister's personal decision, it has to be fairly and fully presented to him so that the material facts and considerations are before him. The need for services of this kind is present in every department which has a political head.

There is another common feature of all work which is strictly administrative in character. It is usually described—for instance, by the Reorganization Committee of 1920—by the somewhat general expression “the formation of policy.” What is meant is, we think, this. The business of government, if it is to be well done, calls for the steady application of long and wide views to complex problems; for the pursuit, as regards each and every subject-matter, of definite lines of action, mutually consistent, conformed to public opinion and capable of being followed continuously while conditions so permit, and of being readily adjusted when they do not. Almost any administrative decision may be expected to have consequences which will endure or emerge long after the period of office of the Government by which or under whose authority it is taken. It is the peculiar function of the Civil Service, and the special duty of the Administrative Class of that Service, in their day-to-day work to set these

wider and more enduring considerations against the exigencies of the moment, in order that the Parliamentary convenience of to-day may not become the Parliamentary embarrassment of to-morrow. This is the primary justification of a permanent administrative service. Vacillation, uncertainty and inconsistency are conspicuous symptoms of bad administration. The formation of policy in this limited sense—subject always to the control of the Minister and to the supreme authority of Parliament—is typical of administrative work in all departments and in relation to all subject-matters whether of greater or of lesser importance.

All administrative work is carried out under statutory authority or, in certain fields, under the prerogative powers of the Crown. To a large extent it consists in the application to particular circumstances of general principles laid down in the statutes, or the administration of financial provision made by Parliament, in pursuance of the powers vested in the Department in that behalf. It involves necessarily the preparation or study of proposals for the alteration of the existing law in the light of changed circumstances, new policies or experience. It is indeed true that proposals for amending legislation within the administrative sphere do, to a large extent, and perhaps mainly, emanate from Departments. The statement that these processes form an important part of the work of administration affords, however, no ground for any suggestion that the Civil Service seeks to usurp the functions of Parliament itself. The functions are essentially different.

These, we conceive, are the common characteristics of all administrative work, whatever the subject-matter. In each particular branch of that work other characteristics will also be found, but they are special to those branches. For example, in the Board of Education and Ministry of Health, the important function of maintaining good relations with the autonomous Local Authorities, while securing in general the application of those standards of local administration which Parliament desires, is a type of work which is not found in a Department like the Customs and Excise or the Admiralty. Similarly, in some branches but not in others, one of the functions of administration is the determination of policy in the light of technical advice, which has to be weighed and balanced against other non-technical considerations, such as financial conditions or the state of public opinion.

Thus the efficient performance of the ad-

<sup>23</sup> Appendix VIII to Minutes of Evidence: *Statement* submitted by the Association of First Division Civil Servants, 1930.

ministrative work of the various Departments calls in all cases for *a trained mental equipment of a high order, while in the particular case powers developed in some particular direction are needed. In some spheres, what is most wanted is judgment, savoir-faire, insight, and fairmindedness; in others, an intellectual equipment capable of the ready mastery of complex and abstruse problems in, for instance, taxation or other economic subjects, imagination and constructive ability.*

It is important to distinguish between the substance of administrative work and its form. The latter may be a memorandum, a draft regulation, an inquiry, a conference or interview, a verbal decision or instruction to a subordinate, or a minute on official papers or an official letter. The substance of it is the exercise of a sound and informed judgment upon the subject-matter in hand; and this is equally true whether that judgment be final or to be submitted to higher authority.

The sentences which describe the qualities have been italicized in order to bring home their full import. And yet even the whole passage does not quite reveal all the gravity of the problem. For the men who enter this class are not merely secretarial; *they are the young shoots who may twenty years hence be permanent heads of the departments or very closely associated with them.* Their position in the governmental process will be not merely instrumental to, but creative of state policy. The significance of this must at once be appreciated.

The Permanent Secretaries have usually had perhaps more than twenty years of very varied official experience before they attain their position; and it is extremely rare for any to have served in only one department; indeed, just before World War II in the thirty principal departments, twenty-three had served in one or more other departments. At that stage there is considerable transfer from department to department. Those entrants, who, tested by time, experience, and comparison with their colleagues, have ascended to one of the first fifty positions in the service, are, indeed, men of high quality. Ministers soon learn, by taking cautious stock for a time, the respective

zones of usefulness of themselves and their permanent subordinates. If they are too ignorant or lazy to learn—and it is proper to say that some have been—they are helped by their cabinet colleagues, or they sink into pompous quiescence. In that case, the day-by-day administration runs routine-wise, while general policy is unchanged or is made by the initiative of Parliament or the cabinet. The permanent staffs can be excused a little impatience with that minister who cannot immediately understand their account of what two decades has taught them, as well as he who too rashly assumes that it may be learned and confuted in as many hours.

Sir Warren Fisher has stated the principles of cooperation soundly:

Determination of policy is the function of Ministers, and once a policy is determined it is the unquestioned and unquestionable business of the civil servant to strive to carry out that policy with precisely the same energy and precisely the same good will whether he agrees with it or not. That is axiomatic and will never be in dispute. At the same time it is the traditional duty of civil servants, while decisions are being formulated, to make available to their political chiefs all the information and experience at their disposal, and to do this without fear or favour, irrespective of whether the advice thus tendered may accord or not with the Minister's initial view. The presentation to the Minister of relevant facts, the ascertainment and marshalling of which may often call into play the whole organization of a Department, demands of the civil servant the greatest care. *The presentation of inferences from the facts equally demands from him all the wisdom and all the detachment he can command.*<sup>24</sup> The preservation of integrity, fearlessness and independence of thought and utterance in their private communion with Ministers of the experienced officials selected to fill the top posts in the Service is an essential principle in enlightened government as—whether or no Ministers can accept advice thus frankly placed at their disposal, and acceptance or rejection of such advice is exclusively a matter for their judgment—it enables him to be assured that their decisions are reached only after the relevant facts and the various considerations have, so far as the machinery of

<sup>24</sup> Present author's italics.

## HOW THE ADMINISTRATIVE CLASS IS CHOSEN

government can secure, been definitely brought before their minds.<sup>25</sup>

If, then, such a status and service are to be the culmination of a regular career, the preparation and the continued training of the entrants are of great moment. If all that were required were any single one among the qualities in the italicized passage for each individual job, then, perhaps, the specific tests might be invented, though this is improbable since each quality is itself rather nebulous and composite. But the difficulty is immensely increased when we reflect that to each job several of the qualities are essential, and that as the administrator proceeds in his career, now one and now the other, and all in various combinations, will be called upon, and this not with precise predictability. It is doubtful whether the nature of the problem has ever been considered as rationally as it deserves, but three generations of muddled development have brought us within sight of a solution.

*The Method of Study.* It is clear that the subjects of study matter less than the method of study, and that the demonstration of mind is more important than the display of information. The aim is not to recruit a departmental expert, but to discover a mind which for capaciousness and vigor will continually be able to master the technicalities of the job, indeed, a succession of jobs, through promotion and transfer. At a comparatively early stage, for example, the young administrator will be cooperating with colleagues and subordinates in sifting the information from persons and documents: that is, in deciding what is and is not important enough to go forward to the administrator and political heads of the department as relevant ingredients in the making of policy. Macaulay, then, was perfectly right to look to unspecialized university studies. It is clear that the excellence of this test and to some extent of the nature of those studies must depend on the tutorial method employed, and on the spirit and outlook of the uni-

versities. On the whole, the universities, old and young, look rather to the building of a liberal character than to the production of erudite, unpractical pedants or very practical technicians. The finished product is to hold his learning like a gentleman; he is to be a man of the world with a well-trained mind; he is to be a superb thinker. If there is a choice between the liberal, tolerant mind, and efficiency, then efficiency in the harsh and aggressive sense is well lost. This has accorded well with the general character of the people—indeed, it is its produce—and of Parliament. It has tempered the inevitable intrusions into private lives, of liberty, and property, which state activity implies.

As to the tutorial method, this is sufficiently different from that of other countries with similar civil service problems to give a special character to the British system. In the United States there are too many lectures and textbooks and too little severe individual wrestling with problems; they know more than all about it, but do not know what it is all about. In Germany a similar situation existed, except that students, not being forced to attend lectures, studied very hard privately because the examinations were stern, far sterner than in American universities. So also in France, but the clarity of the language and the civilized tradition are a salvation.

In these two Continental countries the tendency is to produce a highly doctrinaire type or recruit for the civil service. In England, especially at the older universities, with numbers small in comparison with other countries and with these numbers the result of a very heavy competition for admission during the secondary-school age, there is less lecture and textbook teaching—which is merely passive study—and much more personal contact between student and tutor. The subjects studied are not many, but they are studied deeply enough to make possible and awaken critical effort. The method is almost Socratic. In small seminars, or individually, the undergraduate brings his paper containing his own

<sup>25</sup> Tomlin Commission, *Minutes of Evidence*, p. 1268.

individual answer to some problem in political science, history, ethics, lingual or mathematical principle, produced by himself from books or documents recommended by his tutor. For an hour or more the effort is submitted to a ferreting, worrying, persistent examination, accompanied by suggestions to the student, recommendations of further or alternative reading, the indication of alternative solutions and points of view, and a further spontaneous cross-examination of the student's defensive explanations. The student learns to parry—a very important technical accomplishment in administrative life. His whole effectiveness depends not on what he knows but on how he can handle his knowledge to solve a problem. The tilling of his mind is exceedingly intensive. Through a subject, but only through it, he is learning a method and *savoir faire*. Quite unconsciously the student is preparing himself for work in administration, for it is rather like the process of holding the politician's (or his superior's) proposals for action or inaction to the touchstone of penetrating reason, so that the elements are ranged before one, to be recognized and evaluated, chosen or discarded, as the politician then desires. It is a critical mind that is being trained. As an Oxford don once said: <sup>26</sup>

[Oxford philosophy] . . . affords to the future civil servant or lawyer an unrivaled training in precision of phrase and elucidation of phraseology. Anyone who has really mastered this book [Professor Joseph's *Essays in Ancient and Modern Philosophy*] will have a mind ready to expose loose thinking and short cuts in arguments: he will in fact be a champion debunker of wordy nothings—but he will not be equipped with any understanding of the social problems of his own or Plato's world, nor will he have gained much insight into the real movement of scientific thought. He will have learnt not to understand problems, but to expose fallacies. Not one of his deep-seated prejudices or presuppositions will have been touched, though certain rationalisations of them will have been shown to contain contradictions. But he will have been armed with

a *dialectical* still sufficient to destroy the arguments of everyone he may chance to meet.

This is high praise mixed with criticism, and the criticism I take to be too severe.<sup>27</sup> Supposing, however, this tutorial method should be applied to world history, political science, economics, sociology, to "Modern Greats" at Oxford, the Economics and History Tripos at Cambridge, or a degree in economics and political science elsewhere? Then, I hold, the critical minds thus produced are of the greatest benefit to democratic government, for the politicians and the social philosophers and missionaries are only too eager and fruitful in their proposals for reform or inaction, and the civil service is urgently needed as their critical assessor, even, as Graham Wallas once pointed out, as "the Second Chamber."

*Subjects of Examination.* This brings us to the subjects of the examinations, after a discussion of which we may be able to sum up the value of the preparation for this, the highest grade of the service. It was natural that in the middle of last century and for decades after that, classics, mathematics, moral philosophy, history, and law, which were the chief subjects of university study, should be the only subjects of the examination. But classics, because of the foundations and scholarships and the eight-century old tradition, continued to bulk very large in the administrative examination, even when many new faculties had been established. For the men who made the recommendations to the civil service commissioners had been students a generation or two ago. As educationists they were less concerned with administration, which is serviceability, than with scholarship, which is the production of mind as mind. "We consider that the best qualification for a civil servant is a good natural capacity trained by a rational and consistent education from childhood to university . . . We do not wish candi-

<sup>26</sup> R. H. Crossman, *New Statesman and Nation*, November 30, 1935, book review.

<sup>27</sup> For another relevant extract from the report of the Committee on the Civil Service Class I Examination (Cmd. 8657 of 1917), see footnote 13.

dates to adapt their education to the examination; on the contrary the examination should be adapted to the chief forms of general education."<sup>28</sup> It must, of course, not be thought that the study of ancient philosophy or classical history and literature is inappropriate to the preparation of administrator's activities. Properly taught, they teach all sorts of social and political lessons.

Yet the civil service commissioners have yielded and included in their syllabus no less than eighty-four subjects.<sup>29</sup> Of recent years, criticism of the curriculum has centered upon the advantage in marks given to the classical and history schools compared with political science and economics. The figures show that for the eleven years 1925 to 1935, classics supplied thirty-five out of every hundred entrants, history twenty-five, modern languages eight, economics and politics seven, mathematics six, and mixed history, languages and literature seven. The last five years show no appreciable change in the proportions—classics and history still supply well over fifty per cent of the administrative class. (History, be it remembered, is often "government.") The balance of marks has recently been more fairly redressed, and we may expect more entrants from the older and the younger universities offering these subjects. *It is important to insist that it is the method of studying and learning and not the subject of information which is of moment in selection for administration.* Yet there is an advantage in studying the social sciences—for there the mind is being trained and the judgment formed through reflection upon causal relationships in phenomena which are the immediate setting of the services to be administered. Much more could be urged in their favor—but the more conservative claim is claim enough.

*The Value of the Preparation.* We are now in a position to assess the value of

the preparation and selection for the administrative grade. The competition is very severe, for the situations attract the most capable among the undergraduates of any year. Only a combination of extraordinarily high intelligence, intellect, and character can be successful. The civil service commissioners have devised a method of marking to secure "that no credit be allowed for merely superficial knowledge."

We may hope that these qualities will in the future be drawn from a far wider group in the nation than is at present the case, for examination (1925 to 1936) shows that nine Oxford and Cambridge men are successful to every one from all other universities, despite the fact that they have only less than one third of all the male university students. Of the Permanent Secretaries appointed between the wars to be the head of the government departments, forty came from "public" schools, eleven from grant-aided schools, five from Scottish schools, and five from other sources, and then all via Oxford, Cambridge and Edinburgh. Now it may be argued that some of those who enter from the older universities will have arrived by scholarships from the public elementary schools and from municipal secondary schools. This is true: but examination of the lists shows that even in the twelve years before 1937, nearly 62 per cent of the recruits come from the public schools (especially from the few famous ones), although such schools have a total of only 15 per cent of all the secondary school attendance in the country.<sup>30</sup> Almost all come from the comfortable middle and upper classes. These have great virtues, as anyone who knows them will gladly acknowledge: charm, and tact, and literary facility. They are usually incorruptible and have a high sense of public duty. They are "constitutional." They may have impenetrable social prejudices, but these are not usually rampant, and above the basic prejudice.

<sup>28</sup> See E. L. Woodward, *Short Journey* (Oxford, 1946), for the luminous autobiography of an Oxford don and of teaching at Oxford.

<sup>29</sup> See appendix to my *British Civil Service* (London, 1937).

<sup>30</sup> In the 1936 competition, thirty-nine out of fifty-two entrants to the administrative grade came from "minor" public schools and municipal secondary schools.

is a mind which has been taught to ask questions. They are capable of a considerable degree of *esprit de corps*. But it is questionable whether they can ever easily escape from the sense of superiority unconsciously assimilated in their country or suburban homes and public schools and colleges. They are too alien to their subordinates, perhaps insensitive to impressions from clever "outsiders," and not markedly ruthless in the exposure of incompetence in their own ranks. If their composition included the memory of misery, hunger, squalor, bureaucratic oppression, and economic insecurity, perhaps a quality would be added to their work in the highest situations which could not fail to impress the minister at a loss for a policy or an argument. How essential it is for the state to be served by all kinds of talents and experience! Everyone must acknowledge that failing inborn sympathy or personal experience, the significance of many social situations is ignored or underestimated.

Also, it is urgent to remember that the education so far obtained is not the end, but only the beginning, of men's spiritual development. They have learned only the rudiments, and that in books and from hearsay: they enter the service between the ages of twenty-one and twenty-four. They emerge from the gray cloisters and the twilight halls, and in a few months enter the massive stone buildings forevermore. They lift their eyes from the second-hand books, and open them again on the dog-eared second-hand files. It is clear that something more than the present system is necessary for successful administration. There is direct evidence that the present system is not quite perfect. There is, first, the evidence of Sir George Murray (a very great administrator even among Victorian stars) before the Macdonnell Commission of 1914. He said:

What I was thinking of was this: That while the men who are drawn from the Class I Examination are, I think, very good for the purposes for which they are required for the first ten, or twelve, or fifteen years of their official life, I have at times been rather disappointed at finding how few of them emerge satisfac-

torily from the ruck and come out as really capable heads of departments.

[Chairman:] Will you just explain a little further? Is there, do you think, anything defective in the original way of selecting the first-division men, which explains the fact you mentioned of their turning out badly when they get to fifteen or twenty years' service?

[Sir George Murray:] I did not wish to say that I thought they turned out badly as a body, but merely that I should have expected that more of them would have been better qualified for the best places that were open to them. But I do not think that anything you could do in prescribing the subjects for examination or in making any change in the methods of appointment, could possibly affect that.

The comment made upon this by the Committee on the Class I Examination was:<sup>31</sup>

If among those selected by open competition there are not always to be found a sufficient number who, after many years of service, are, by virtue of their initiative, force of character, freshness of mind, and constructive ability, fit for the highest posts, the fault may lie in the system of training after entry, and in the conditions of subordinate service; it need not lie with the competitive system.

Before the Tomlin Commission of 1929 most heads of departments argued that the entrants might do in their raw state for other departments, but that for *theirs* some previous administrative experience was desirable. Sir Warren Fisher said that some of the heads of departments came to him about their recruits, "some censorious and some purring like cats."

*Remedies for Defects.* The remedy lies in three measures. The first is to make the two-years period of probation a real testing time, so that official and department may sever connections if they are not suited, and at the same time, a training period. This was, in part, the intention of the Reorganization Committee of 1920. It said:

Men and women so recruited should be regarded as a Cadet Corps from which selection should be made to higher administrative posts. . . .

<sup>31</sup> Paragraph 13, pp. 10 and 11.

## HOW THE ADMINISTRATIVE CLASS IS CHOSEN

In 1935 an able American investigator asserted<sup>32</sup> that the weaknesses of this class were:

(1) the lack of knowledge and appreciation on the part of administrators of the affairs of the outside world except in so far as they pertain to their work, (2) the lack of knowledge of the activities and policies of the departments of government, other than those in which they serve, and (3) the failure to consider public administration as a science with a body of fundamental principles, and the insistence on treating it as an art or mystery revealed only to those who have followed the initiatory rite through which they have passed, or alternatively as a faculty inborn, which is denied to all who are not blessed with it at birth. There are notable exceptions, but this indictment may safely be brought against the great mass of the members of the class. It is submitted that the principal reason for it is lack of proper training, although facilities for it are readily available.

Now, since 1919, the Treasury has demanded a period of service in other departments before it chooses its own recruits. The Ministry of Health has initiated its recruits into the organization of the department for some weeks. The Ministry of Labour has sent its recruits for a six-months tour of duty to provincial offices, after two years' service. The Colonial Office sends its officers for a two-year tour of duty to a colony or dominion, after some years of service. The Foreign Office and Diplomatic Service were amalgamated in 1919 partly in order to secure a circulation of men from London abroad and back to London, so that first-hand knowledge might flow in. It is more than ever important, as the omnipotent hands of the state stretch out toward all of us, that civil servants shall early be fitted for their specific tasks, and that they shall get to know the public, as living individuals, even if only for a short time. It is an effective way of helping a civil service from degenerating into a bureaucracy. The administrative class itself is emphatic on this question.

<sup>32</sup> Harvey Walker, *Training Public Employees in Great Britain* (New York 1935) p. 13.

We consider it important that the probationary period (normally two years) should be rigidly enforced and that the officers should be discharged before or at the end of that period unless it is reasonably certain that they will become efficient administrators. In the absence of this certainty their retention is not only opposed to the interests of the public service, but it is a mistaken kindness to retain in the service a man who is unlikely to be fitted for promotion and may subsequently have to be discharged on the ground of inefficiency at an age when it is much harder for him to obtain other employment.<sup>33</sup>

Hitherto, after such a period of training (but usually only after undirected perambulations about the building), the civil servant has entered into the long spell of forty years' hard labor in the office. How shall he be kept alive and inventive? There is a serious chance of slavery to routine, the loss of inspiration and inventiveness, the falling into a deep, long groove. Sir S. H. Wilson, permanent undersecretary of state for the colonies, expressed his doubts to the Royal Commission of 1929 (Question 20,981) in these words:

I picture to myself a man going into the civil service at the age of twenty-two or twenty-three, or whatever the age is, coming from the university, passing the examination, and sentenced for the rest of his life to live in Whitehall, and to come up by train every morning from Woking and go home at the same time every evening, always seeing the same people, always dealing with the same work. I think it requires very little imagination to realize what that man must become after about twenty or twenty-five years, if he does not see more of the world. I think it is wonderful that they are as good as they are.

Of course, natural emulation among colleagues and the motive force of promotion—along with love of the job itself—stimulate administrative virility. A glance at the pyramid of the administrative class will show that the men in the lower ranks must bestir themselves if they are to reach the top at a desirable age. Table 25 shows the age distribution on April, 1946, of a representative sample

<sup>33</sup> From statement cited p. 769 above.

## ENGLAND: ORIGINS, REFORM, RECRUITMENT

comprising two thirds of the administrative class, excluding assistant principals (the lowest stratum of this class) and temporary civil servants, but including war-time temporary civil servants since fully employed.

Then, too, there is an incentive in the refreshing effect of attachment as private secretary to ministers and even prime ministers, and as secretary to departmental committees and royal commissions—a post which involves the planning and management of the enquiry, the scrutiny, analysis, and marshaling of evidence, presence at the examination of witnesses and at discussions between the members, and the drafting of the report. Nor, nowadays, as distinct from years ago, can the

must be substituted. The Report of 1853 clearly recognizes what was being lost when the sheltered occupation with security of tenure was to be consequent on successfully passing an examination:

[Outside professions] supply a corrective which is wanting in the Civil Service, for as a man's success in them depends upon his obtaining and retaining the confidence of the public, and as he is exposed to a sharp competition on the part of his contemporaries, those only can maintain a fair position who possess the requisite amount of ability and industry for the proper discharge of their duties. The able and energetic rise to the top; the dull and inefficient remain at the bottom . . . their course is one of quiet, and generally secluded, performance of routine duties, and they consequently have but limited opportuni-

TABLE 25<sup>34</sup>—AGE DISTRIBUTION OF THE ADMINISTRATIVE CLASS OF THE CIVIL SERVICE  
(REPRESENTATIVE SAMPLE): ENGLAND, 1946

<i>Civil-service Position</i>	<i>Age of Direct Entrants</i>			<i>Age of Promotees from Other Grades</i>		
	<i>Over 41</i>	<i>Under 41</i>	<i>Total</i>	<i>Over 41</i>	<i>Under 41</i>	<i>Total</i>
Permanent secretary	16	1	17	6	—	6
Deputy secretary and equivalent	25	1	26	17	—	17
Undersecretary and equivalent	55	9	64	46	2	48
Principal assistant secretary	32	7	39	27	2	29

Principal	53	175	228	446	113	559

educative effect of many personal contacts with local authorities, foreign representatives, deputations from social and industrial groups, business and labor representatives, and clamorous or helpless individuals be dismissed as potent factors in bringing the fresh breezes of real life along the interminable corridors of Whitehall and through the baize doors. It has been shown, within the service, that a severe apprenticeship does inform and train the cadet very considerably.<sup>35</sup> Yet there is a curiously muted and aloof air about the official life. Some artificially organized stimuli are essential: if the boisterous, dangerous storms of the independent businessman's existence are excluded, then deliberate "air conditioning"

ties of acquiring that varied experience of life which is so important to the development of character.

That is, *competition* ceases; the ruthless, pitiless competition of private business, which drives men out of business and a livelihood unless they can master themselves, their environment, sufficient science, and their colleagues and clients, and sell their services or goods to those who demand them or can be persuaded that they need them.

One such stimulus would be to give them a year of work (out of the two years' probation) divided between six months with the local authorities, and six months in a foreign country or countries.<sup>36</sup> But

<sup>34</sup> From *The Reform of the Higher Civil Service* (Fabian Society, London, 1917), p. 29.

<sup>35</sup> H. E. Dale, *The Higher Civil Service of Great Britain* (London, 1941).

<sup>36</sup> Something like this has now been recommended (and instituted by the Treasury) by the Report of the Committee on the Training of Civil Servants (Cmd. 6525; 1914). The operation of the Treasury training scheme is re-

if they learn that life goes on outside their departments, and not by their grace; that people can be different without being cranks; that there are alternative principles entirely to those upon which life in their class and nation are organized, it may be that the true inward value (or valuelessness) of their own civilization and function will become the more evident after comparison and reflection. They might be asked to report upon the foreign treatment of some subject falling within their own department. Once in the department, the administrators should receive six months' leave with full pay, for study abroad, every seven years or so.<sup>37</sup> Then, from the age of thirty-five onward, they should take part in the training arrangements of the subordinate grades, in the hope that they might, in teaching them, learn something about themselves.

Finally, as the Tomlin Commission remarked, great care must be taken not to appoint too many cadets in comparison with the number of higher situations, for to do that, as the First Division Association testified, was to condemn energetic, capable men to the perdition of repeating themselves *ad nauseam*! Up to 1934, only one third at the age of thirty-four could rise to principal; one third to assistant secretary at forty-five; one fifth to principal assistant secretary; one seventh to deputy secretary, and one seventh to secretary, about the age of forty-eight if at all.<sup>38</sup>

*The Viva Voce Test.* In pursuing the subject of the fitness of the administrative

group's selection and promotion for the work to which it becomes assigned in the passage of time, it was convenient not to stop and examine one of the factors which weighs heavily in the entrance examination: the interview. The interview is designed to give the civil service commissioners some evidence of personality, even character. It may be that the written tests are some evidence already; and Macaulay clearly declared that young men who in competition with their fellows of the same age had shown superiority in studies might be regarded as having shown character also since they could not have prepared themselves for the success they had attained without having applied themselves to their studies and having eschewed sensual pleasures, or wine, women, and song. The problem of selection for character is still the *pons asinorum* of recruitment to the public services everywhere.<sup>39</sup> The British civil service experiments with the interview.

The interview, or *viva*, was established in 1917 on the recommendation of the Committee on Class I Examination, which said:

A Royal Commission expressed a cautious inclination toward a *viva voce* examination, but made no definite recommendation. The Consultative Committee appointed by the Board of Education on Scholarships for Higher Education in their report, 1917 (Cd. 8291) say that there should be a *viva voce* examination.<sup>40</sup> On this point as on almost every point of our report, we are unanimous. We believe that qualities may be shown in a *viva voce* examination which cannot be tested by a written examination, and that those qualities should be useful to public servants. It is sometimes urged that a candidate, otherwise well qualified, may be prevented by nervousness from doing himself justice *viva voce*. We are not sure that such lack of nervous control is not in itself a serious defect, nor that the presence of mind and nervous equipoise which enables a candidate to marshal

ferred to in the Fifth Report from the Select Committee on Estimates (with Minutes of Evidence), "Organisation and Methods," No. 143 of August, 1947. Cf. below, Chap. 34.

<sup>37</sup> Something like this also has been proposed by the Committee on the Training of Civil Servants. Cf. below, p. 783.

<sup>38</sup> The Fabian Society's *The Reform of the Higher Civil Service* (London, 1947), written by civil servants, recommends that promotion should be so organized as to bring the best people to high posts at a comparatively early age. It recommends these promotion zones: assistant secretary, 32-40; undersecretary, 35-49; deputy head or head of department or equivalent, 40-52.

<sup>39</sup> Cf. Oscar K. Buros, *Educational, Psychological and Personality Tests of 1935-36* (New York, 1937).

<sup>40</sup> Actually they were concerned with the selection of candidates for scholarships, and not with the choice of administrators.

all of his resources in such conditions is not a valuable quality. Further, there are undoubtedly some candidates who can never do themselves justice in written examinations, just as there are others who under the excitement of written competition do better than on ordinary occasions. . . We consider that the *viva voce* can be made a test of the candidate's alertness, intelligence and intellectual outlook, and as such is better than any other. . . We consider that the *viva voce* examination should not be in matters of academic study, but in matters of general interest, in which every young man should have something to say.

The civil service commissioners not only supported this reasoning, but vindicated the actual proportion of the marks assigned to the interview. As subjects to the value of 1000 marks must be offered from the numerous options, and as all candidates must in addition thereto take an essay paper carrying 100 marks, English 100, present-day knowledge 100, every-day science 100, and an auxiliary language 100, while the interview carries 300 marks, the latter was no less than one sixth of the total marks for the whole examination. It is an important proportion, and it has had the effect of greatly altering the position of many candidates on the list as settled by the written examination.<sup>41</sup> This excessive proportion of marks to the total obtained until the 1937 examination, when the commissioners' regulations even increased it from 300 out of 1800 to 300 out of 1300! We deal first with the experience of the *viva* down to 1936, and this will show how serious is the commissioners' new step.

The board of interview consists of certain distinguished figures in university education, and some retired civil servants. Its business is not to place people by their excellence in discussion of a "subject," but to place them for "alertness, intelligence and general outlook," clearly a subtle and laborious task, if it is taken seriously. In fact, the interview until World War II lasted about a quarter of an hour; it occurred usually before the

examination, since there are many candidates; it was therefore not based on the subject matter of the examination. In form, it was a desultory conversation, indefinite and almost void<sup>42</sup> regarding the scholastic career and the social interests and activities of the candidate. Nothing much was tested by it, and hardly the qualities mentioned in the regulations. In fact, the college tutors' testimonials played a considerable part in the result.<sup>43</sup> Further, the method did not make sure of retaining the good, or of getting rid of the bad.

Now a test of this kind lends itself too readily to the suspicion that qualities other than those appropriate to the service have undue weight. At any rate, two tests of the figures and methods make clear the intrinsic untrustworthiness of the test. An analysis of results from 1924 to 1929 shows that<sup>44</sup>

on the average when a candidate submits himself for the *viva voce* test, there are forty marks which may be added to or subtracted from the true measure of his personal equation, and these forty marks will be added or subtracted in a haphazard manner. But the *viva voce* test on which is awarded 300 marks maximum, lasting perhaps fifteen minutes, and carrying with it the random plus or minus forty marks, may be altogether decisive. That this is the case may be seen from a consideration of results in recent years. . . This element of chance may actually operate in the same way as if a candidate's fate were being decided by the tossing of a coin or the throw of a dice.

A more serious reflection on the system emerges from the investigation undertaken by the International Institute Examinations Enquiry. This body established a replica of the civil service *viva voce* examination and discovered that for the same candidates, but by the different boards, differences of as many as 92 and 70 marks were shown in extreme cases, with the average difference of 37 marks. The board of enquiry commented:

<sup>42</sup> *Ibid.*, Question 1419.

<sup>43</sup> *Ibid.*, Question 1375.

<sup>44</sup> *Public Administration*, April, 1930, pp. 231-36.

<sup>41</sup> Tomlin Commission, *Evidence*, p. 60, para. 19.

## HOW THE ADMINISTRATIVE CLASS IS CHOSEN

These extreme differences . . . amounting to 20 to 30 marks out of 100, and the average difference of about 12 marks out of 100, point to the unreliability of the interview test, and indicate the great influence that this test might have in the final placing of a candidate in a Civil Service examination . . . we must conclude that the different influences of the Boards have been sufficient in this case to mask the common influence of the same set of candidates.

This was further borne out by comparison of the marks awarded by individual examiners, which varied very much, but less so than the common results obtained by the boards as such.<sup>45</sup> One candidate put first by a board was put thirteenth by the other, another put seventh by the first board was put eleventh by the second, and so on.

These results show definitely that the evidence on which the examiners could judge the candidate was different in the two cases, that is, that the two interviews were so differently conducted that we might almost suppose different candidates to have been examined.

This nebulousness of result is not difficult to explain. Between the private business interview and the civil service *viva voce* test a profound difference exists. In the former, the employer knows in great detail, and from reality, the nature of the actual job to be filled, and capacity to fill it is preferred to adventitious qualities which may be engaging but unprofitable. The civil service board of interview do not know the exact nature of the situation, although that they should is shown by the requirements for the Colonial Service, that interviewers who have been to the colonies be included in the board. If anything at all is in their consciousness, it is a very vague picture indeed, and it can hardly be a kinetic one—that is, include the possibility of development to meet greater responsibilities in the years to come. They will never see, and certainly will not lose money by, a mistake, and so they are more likely to be influenced by superficial characteristics. A

“nice” boy, with engaging manners and a pleasant accent, has a much better chance of having his relevant qualities assessed excessively than the rough diamond has of securing arithmetical justice.

If we really care about the efficiency of the civil service as an instrument of government, rather than as a heaven-sent opportunity to find careers for our brilliant students, these principles should be adopted. The interview should last at least half an hour on each of two separate occasions. It should be almost entirely devoted to a discussion ranging over the academic interests of the candidate as shown in his examination syllabus, and a short verbal report could be required on such a subject, the scope of which would be announced at the interview. As now, the interview should be a supplementary test and not a decisive selective test. The interviewing board should include a business administrator and a university administrator. The interview should come after and not before the written examination, and if this means some inconvenience to candidates and examiners, then they must remember that they are helping to select the government of a great state, and a little inconvenience is not to be weighed against such a public duty. The university tutors’ reports should not be consulted until the interview stage has been concluded and marked. More weight might be justifiably accorded such reports if the reporting tutors from various colleges and universities met to determine a common policy of self-restraint in hymning their students’ virtues. Finally, since the arbitrary will still prevails, it ought to be limited by the reduction of the interview marks maximum from 300 to 150.

It is deplorable, and utterly amazing, to find that on the recent revision of marks<sup>46</sup> of the various subjects of the written examination, the civil service commissioners not only missed the opportunity to make this reduction in the weight of the interview, but for some un-

<sup>45</sup> *Examination of Examinations* (New York, 1936).

<sup>46</sup> Cf. The regulations for admission issued by the Civil Service Commission (currently, London).

announced reason actually increased it! The *viva* used to be 300 out of 1800: it is now 300 out of 1300. The results of three or four years' work, culminating in and tested by the written examination, are to be more than ever the sport of an interview conducted as we have explained! This reflection is not brightened by the changed formula for the *viva*.

The object of the interview is to enable the Board to assess his suitability for each of the Services for which he is entered, and in framing their assessment the Board will attach particular importance to his intelligence and alertness, his vigour and strength of character, and his potential qualities of leadership.

The important terms in the definition do show an advance, in that it is now recognized that the Board is searching for administrators, that is to say, for men and women who can not only think, argue, and write, but also devise, act, and lead.

It is gratifying that since the end of World War II, exceptional attention has been paid to interviewing for the administrative class. The period of interview has been lengthened to something like three quarters of an hour, candidates are sometimes interviewed twice, the questioning is more thorough, and the discussion by members of the board afterwards is more deliberate. This is an improvement in itself, not to mention the extended "personality" tests for older post-war entrants, discussed later.<sup>47</sup>

#### ADMINISTRATORS, SCIENTISTS, PROFESSIONAL AND TECHNOLOGICAL SERVANTS

AN exceedingly important aspect of administration is the relationship between the administrative class and the scientists, technicians, and professional men. These latter include barristers, solicitors, doctors, architects, engineers, and scientific and technical research staff. Below them are draughtsmen, technical assistants, supervisory staffs in industrial establishments, clerks of works, and foremen of works. Their importance for public administration needs no extensive descrip-

tion. It is enough to say that there is hardly any step the state wishes to take, in devising the law or executing the details of policy in all these services, without vital dependence at some stage on the advice of a scientific expert. Two examples may be given: a policy of national physical fitness and the advice of biologists and nutrition experts; the execution of a housing and slum clearance policy and the advice of architects, engineers, and surveyors.

Two questions arise (1) the recruitment of these officials; and (2) the relationship of their special expertness to the administrators and the minister, that is, the political chief of the department.

*Recruitment.* As to their recruitment, there are no really serious problems. As specialists, they have the publicly recognized qualifications. When individual vacancies arise they are advertised, and a selection is made by the method of competitive interview. There are, in fact some five hundred distinct grades. Inquiry has shown the difficulty of pooling all posts in order to have common recruitment, which might allow of a choice of candidates on intellectual grounds wider than the narrow specialism. Some improvement is, however, possible, especially in the case of the research staff, and had recently been instituted.<sup>48</sup>

*Role in Policy Making.* What of their cooperation in the making of policy? The specialists maintain that the parliamentary head, in weighing the recommendations of his administrative subordinates, should be "fully seized of the nature of the technical advice upon the matter under consideration."<sup>49</sup> They urge

<sup>48</sup> Cf. Report, Barlow Committee on Scientific Manpower, Cmd. 6824 of 1946. Cf. also *Science and the Nation*, issued by the Association of Scientific Workers (Pelican Books, 1947). The development is not unrelated to the stimulus of war, followed by the exceptional needs of stricken postwar economy, and the conscious planning of national prosperity through nationalization of basic industries and other policies culminating in the planning institutions auxiliary to the cabinet system described on pp. 608 above.

<sup>49</sup> Cf. para. 48, App. XI, *Minutes of Evidence*, R.C.C.S., 1929-1931.

<sup>47</sup> Cf. p. 784.

arrangements to effect this, even proposing a system of advising the minister by boards composed of administrators and specialists. If this was not feasible, then there should be a right of access to the minister on technical questions, and denied, at the same time, to the mere administrators. Their motives for these demands are not difficult to define. They wish mistakes to be avoided. They alone can tell where, when, and how the technical mistake will occur. The administrator may not appreciate the need for consulting them, and even if he consults them, the full force of their advice may not penetrate his misinformed obstinacy or abate the impetus of his ignorant enthusiasm. It may be also that some specialists believe that they know not merely what will be the scientifically appropriate course, but that their ideas on the good and evil of policy are as good as, if not better than, the administrator's. If their advice is not taken on the scientific order they may be discouraged in their efforts; if their advice is not courted on policy, good teamwork may be jeopardized.

The solution, it seems to me, is properly this. On policy there can be only one hierarchy of responsibility—it is that which passes down from the political chief through the permanent secretary and his administrative assistants. For theirs is precisely the education, training, and status designed to make policy: that is, to weigh up *all* the technical considerations in relation to each other, and to compose a harmonious pattern of values by reference to the expediency implied in the ruling political party's notion of Justice and the Good. As to the urging of scientific considerations directly on the minister, this is equally to be rejected. The minister's mind may be a fresh mind, but it is a raw mind. He is in no position, normally, to appreciate the full civic value of a specialist's advice, by reference to all the invisible and inaudible technicians who would also need to be heard before the balance of advantage and disadvantage could be struck. And what of the administrative feasibility of a plan? Shall he be personally confronted by all

the specialists? If he were, the poor man would wallow in a chaos.

The minister needs a focused white light; the experts offer a (to him) rather vague, blurred, if fascinating spectrum. Such a spectrum is also all that is obtainable by a board composed of political chief, administrators, and specialists, and it is a spectrum which would only be produced at a loss of time. We can imagine the minister waiting outside the door and asking the Permanent Secretary, "Well, after all that, what do you think we ought to do?" The Permanent Secretary and his assistants provide the sharply focused white light for the minister. It is the only system under which the chaos of technical advice can be reduced to the order which action, that is to say, administration, vitally demands—the relevant being utilized, the rest discarded, with the maximum speed possible in view of the intrinsic toughness of the problem to be solved. Someone must do the picking and choosing, someone must be responsible for the broth, and, as in the nature of the democratic political process, it can rarely be the minister, it must be the minister's other self, the permanent administrator. The specialist ought not to feel aggrieved about this, for the administrator himself risks being discouraged by the minister's refusal of his advice. We are all instruments in a higher social purpose. Yet, if it is the specialist's nature to know more and more about less and less, it is the administrator's responsibility, on pain of being untrue to his function, to seek out perseveringly, and to weigh seriously and long, the science which research discovers and the expert secretes. Nevertheless, the specialist ought not to be denied the opportunity of promotion to the highest administrative posts, if he can show, by experience, the qualifications for them, and deliberate search must be made for the scientists of administrative attainment or promise.

The persistence of the government scientific workers, aided by their colleagues in their professional associations, and furthermore assisted by the tremendous rise in the prestige of science during World

## ENGLAND: ORIGINS, REFORM, RECRUITMENT

War II, won the concession proposed in the last sentence, as the result of a recommendation made by an expert committee which advised the Treasury.<sup>50</sup>

### THE WEAKNESSES AND IMPROVEMENT OF THE ADMINISTRATIVE CLASS

THE relative weaknesses of the British administrative class of civil servants have flown from (1) their comparatively narrow recruiting ground, and (2) the lack of deliberate and systematic training on entry into the service.

*Recruitment.* The first weakness is rapidly being overcome by the extension of the educational freedoms to a point where no really eligible mind fails to receive an open opportunity of competing in the en-

which is almost tantamount to saying recruited from the middle and lower-middle and working class; this proportion is measurable by Table 25, based on a two-thirds sample of the service, given on an earlier page.<sup>52</sup>)

Although this widening of the recruiting ground of the civil service was true of the twenty years before World War II, there were still obstacles. The Education Acts of the postwar reconstruction period, and the increased grants by the government to the provision of scholarships by the municipal and other educational bodies leading to the universities, as well as a trebling of the university accommodation, will set the seal on this beginning and promise. Moreover, the development of social studies, already highly success-

TABLE 26—ENGLAND: SCHOOL BACKGROUND OF CIVIL SERVICE ENTRANTS, 1905-37

<i>Period</i>	<i>Total</i>	<i>Percentage from Public Schools</i>	<i>Grant-Aided Schools</i>	<i>Scottish Day</i>	<i>Miscellaneous</i>
1905-14	283	74	27	18	28
1919-25	197	63.5	43	18	11
1925-37	263	61.8	21	41	15

trance examinations. Figures given in the House of Commons <sup>51</sup>—see Table 26—show a progressive change in opportunity to enter the administrative class by open competition.

Of course, practically every one of these then went on to Oxford or Cambridge before taking the civil-service entrance examination. A grant-aided school means a school maintained or assisted by public funds, managed wholly or partly by the public authorities, and requiring a considerable proportion of free places. It must be remembered that the "public schools" are themselves considerably various in their social composition and economic status. The boarding public schools as distinct from the day schools supplied only 33.8 per cent of the entrants in 1925-37. (Note too the proportion of the higher ranks of the administrative class recruited by promotion,

ful, will provide many students with that educational channel to the public service. It is important that ignorant sneers at history and classics as an approach to the public service be deferred until the meaning of those studies is considered.<sup>53</sup> History is the history of man and his struggles to control his environment and get along with other men; the classical studies provide this insight also. Surely they are incomparable qualifications for a public administrator—if they are pursued deeply enough to teach a man how to think, or, at any rate, the importance to mankind of thinking before acting?

*Training.* As for the second weakness,

<sup>52</sup> Cf. p. 776, above.

<sup>53</sup> It will be noticed that the more recent reforms in university education in the United States—as exemplified in the Harvard Report on General Education, and the college courses on "civilization" and "the humanities" in the colleges of Columbia University and the University of Chicago—return to the older conceptions, with benefit to the students and the nation.

<sup>50</sup> Cf. *The Scientific Civil Service*, Cmd. 6679, 1945, p. 12, paragraph 13.

<sup>51</sup> Cf. Debates, May 8, 1946.

various remedies have been suggested and are being applied. Discussion about training has resolved itself into two stages of thought. At first, during World War II (when the "phony" period of the war had evoked the erroneous impression that the civil servants were at fault), it was suggested that a staff college should be established to train would-be civil servants and further train those already in the service.<sup>54</sup> But on reflection, this was rejected, on the general ground that it appeared castelike and that it was not desirable to unify the mentality of civil servants. A powerful truth resides in the latter observation. In the social sciences, we are not so sure of the truth as to subject civil servants to one set of administrative, economic, or social propositions. It is far better to leave the students free, even to force them, to scatter widely among the different colleges and meet the different minds which have been reflecting on the problems involved. That, also, will enable the service as a whole, or each department when it arrays all its resources of talent, to see a more comprehensive truth and more multifarious alternatives, for the benefit of the minister and the public. This system, then, was rejected. (It should be observed that as soon as the policy of "waging war" began, and civil servants were decisively led by ministers, the service performed miracles, winning the enthusiastic praise of ministers, Parliament, and public.)

Still the problem of postentry training remained. The Treasury Committee on the Training of Civil Servants, especially appointed in February, 1943, to examine the general problem of training at all levels of the service and to consider whether a staff college should be established, published a masterly report in May, 1944. It rejected the idea that entrants should go to a staff college, especially if it were to be one in which tuition was given to private business also. And, in fact, the recently established adminis-

trative-staff college is a private-business-management college. But the committee recommended that a few civil servants might attend as an experiment. "It is extremely difficult to find a firm foundation on which could be based a method," says the Report,<sup>55</sup> "common to both business and Civil Service." The Report appears to base this on the rather specialized business practices which would have to be taught. The members of the committee could not have failed to reflect on the different sense of equities prevailing in business and the public service.

They recommended alternatively (and their plan is in effect) an entrance course of some two or three months, conducted by the director of training and education of the civil service itself, with assistance only from university circles. This would be on a two-day-per-week basis. The purpose is to shorten the process by which the entrant forms his own administrative standards and "professional approach." Lectures, reading, and discussion would give him: explanation of the functions of the departments, and their financial and parliamentary background; departmental, managerial, and procedural techniques; knowledge of the implementing of large-scale administrative schemes of the past; an introduction to cooperation with the public; indoctrination with high civil-service standards—urgency, accuracy, decision, avoidance of incomprehensible instructions and uncertainty of purpose; and an approach to statistics and their logic and purpose.

This training is *pari passu* with responsible work in the departments. The school would become a clearinghouse of ideas, and would be used also for refresher courses, and could be assisted by visits from men of commerce and industry.

The entrant is also to be given work in branch offices where the liveliest business is going on, with a senior officer to serve him as tutorial friend. Departmental talks, and visits to various departments and offices, at all levels, are designed to give him a bird's-eye view of the service.

<sup>54</sup> Cf. Sixteenth Report from the Select Committee on National Expenditure, October 1942, "Organization and Control of the Civil Service," No. 120, p. 37.

<sup>55</sup> *Ibid.*, p. 17.

Where a department has local offices, real work in the field for a substantial time is arranged.

To refresh those who have been in the service for some years, a period of secondment is proposed for those over the age of thirty. There may be periods of observation in commerce and industry or in local authorities (in Britain these are closely connected with the central government and are in a sense its local arms). Above all, those of special ability obtain sabbatical leave for study at home or abroad: this is applicable to those "selected for the promise they show of being worthy of eventual promotion to high administrative work."<sup>56</sup>

This, then, is the provision for the administrative class, and the maintenance and improvement of its traditional preparation and status. Vacancies arising after the end of World War II will be filled in the traditional way.

For the five hundred administrative-class posts to be filled in reconstruction examinations for the service after the war, considerable preference is given to veterans and those who served in civil employment of a warlike character. The prerequisites are university standard degrees of at least a second-class-honors level: the examination is simplified. In addition to the interview as described, a leaf is taken out of the Army method of selecting officers—groups of twenty to thirty candidates spend two or three days at a center, at state expense. A skilled staff mixes with them, and applies individual and collective intelligence and personality tests, interviews, discussions. This test enters heavily into their rating.<sup>57</sup>

This test, it should be noticed, is applicable so far only to those who are entering under the postwar reconstruction scheme, and they are several years older than the normal entrants. It may be that the experiment of the two- and three-day

protracted personality test will be so successful as to warrant introduction into the usual process of selection for ordinary entrants. If the method succeeds, it may be the best answer yet given to the hitherto unanswered problem of selection for character as well as for intellect. Some observers, admittedly on the basis of a short period of trial, believe it is possible that the intellectual qualities will be sacrificed to the animated, kinetic qualities in the recruits. If so, it would be a parlous adventure, since the posts to which these entrants may eventually be promoted require, as we have abundantly shown, the highest of intellectual attainment and power. The writer has heard sufficient about the selection method at the closest quarters to be willing to hope that it is a most valuable new technique of recruitment.

#### BRITISH AND AMERICAN CONTRASTS: SOME VITAL PROBLEMS YET TO BE FULLY SOLVED

IN the writings and discussions of administrative personnel during the past few years, the contact of American and British students has been singularly fertile. A confrontation of some current ideas will serve to clarify problems on both sides of the Atlantic. I shall confine myself here to: (1) the idea that the British civil service is a "class" and not a "representative" civil service; (2) the problem of age at entry; (3) the problem of whether the administrative grade should be a career; (4) the problem of recruitment qualifications.

*The "Representativeness" of the Civil Service.* It has been abundantly admitted by British students that the social basis of recruitment of the civil service in the past has been too narrow. (It has been so admitted in this work.) This teaching was passed to American scholars. British students of the civil service have insisted on the need for a body of officials drawn from all classes in a state which has many social problems because it has classes. They have hoped thereby to secure the assets of wide and dynamic sympathies. But their concern was for something more,

<sup>56</sup> See *Whitley Bulletin*, May, 1949, for details.

<sup>57</sup> Cf. for a full and critical account, Ninth Report, Select Committee on Estimates, "The Civil Service Commission," July 28, 1948, Nos. 203, 205; and House of Lords, *Debates*, May 26, 1948.

and perhaps it was a concern at least as acute as that for social representativeness, and perhaps even its search was for a quality beyond that: they desired that all the most distinguished talent in the nation should get its outlet for the sake of the nation's welfare. They desired also that no talent which had a capacity for development and happiness in the public service should be allowed to wither.

As soon as these things are admitted, it seems an almost inevitable act of Nature that the admission should be transformed into an exaggerated, distorted historical thesis and prophesy. The nefarious influence of Karl Marx must be brought in to show that Britain is about to succumb to the weight of a civil service which is "unrepresentative," and in which, therefore, civil servants appointed as they have hitherto been would not impartially and honorably serve a Labour government. Nothing is said of the effect of the massive changes in the public sentiments regarding the objectives of the state which have occurred since World War I. Nothing is allowed for the changes in the tendency of teaching at the older and certainly the younger universities. No account is taken of the change in the appointment of teachers at universities and the effects of their teachings upon the entrants to the service. No weight is given to the substantially changed attitudes to state activity in economic and social matters. And the sovereign position of the House of Commons as the acknowledged democratic master of the service is left high and dry, as though it were irrelevant to the problem.

Instead of repairing these omissions, a puking version of Marx is taken from the exaggerations of men who have sucked at Marx until they have become bloated. This is the doctrine taught by one treatise, and, of course, it is so simple that it is lapped up eagerly by those who have no direct knowledge and by some who enjoy what the Germans call *Schadenfreude*. Thus: <sup>58</sup>

<sup>58</sup> J. D. Kingsley, *Representative Bureaucracy* (Antioch, 1945), pp. 278-80.

There are, obviously, points beyond which a man cannot go in carrying out the will of another; and the fact that those limits have seldom been approached in the conduct of the civil service since 1870 bears witness to the unity of the middle-class state. [Why the "middle class" should serve the aristocracy at the helm till toward the end of the nineteenth century is not explained.] The convention of impartiality can be maintained only when the members of the directing grades of the service are thoroughly committed to the larger purposes the state is attempting to serve; when, in other words, their views are identical with those of the dominant class as a whole. . . . What can be said with little fear of contradiction, is that the civil service as now constituted would be much less representative of a state in which labor wielded power than it has been of a state in which that prerogative belonged to the upper middle classes. . . . Would this be a source of difficulty? I am inclined to think that it would, for I am arguing that bureaucracies are responsible only to the extent that they are broadly representative. . . . Nor is there much in the social background and experience of members of the administrative class to lead one to believe that as a group they would be able to participate creatively in the development of a Labour program.

This passage is a tragedy of historical misconceptions; is founded upon false history; and is the fruit of a misbegotten determination to see history as it is not, in the name of Marx Almighty, through one of his more erratic prophets.

Look at the leaks in this thesis! "The larger purposes the state is attempting to serve." "Thoroughly committed." "Their views are identical." But the British civil service is now serving a Labour government more enthusiastically than it served interwar governments. The prophecy is wrong: then the history must be wrong. It is, crassly.

Finally, in this respect, the reader may be begged to compare the discussion of parliamentary control on page 530 ff. above, with this supporting statement by the author of the views quoted above on this page (in the same article):

I have said very little in this chapter concerning the formal devices of parliamentary and judicial control. . . . I regard them, in any

event, as of distinctly secondary importance. Responsibility is not to be secured through governmental forms or systems of checks and balances,—though these may sometimes help.

There could hardly be more political error compressed into so few words. And the following words of that author directly after this passage, which is about the Weimar constitution, betray a want of understanding of that system and its breakdown, and a determination to stick to a point even though it is nonsense.

*Age at Entry.* The British civil service restricts entry to certain age limits; the American accepts entrants to quite advanced years—to the junior professional assistants up to thirty-five. What is the British purpose? It is quite deliberate. The service of government is regarded as having a character of its own. It is different from business, from art, from teaching, from other professions. Its objectives are individual, its spirit and methods are special. A government servant must observe certain equities towards all clients which the businessman grows rich by ignoring. He must hold himself responsible and accept the procedures and public obligations, as an artist, loyal only to his own artistic conscience, does not. He must cooperate with others in his own division, in a situation of subordination to some and of command over others, and must work as a partner with other departments, while a physician or an architect has only immediate duties to a client. And unlike the teacher, his business is not only to think, argue, and research for absolute truth, but to employ a combination of unequally valuable truths to fulfill an urgent specific task. As Paul Appleby has reminded many American students,<sup>59</sup>

Government is different: the dissimilarity between government and all other forms of social action is greater than any dissimilarity among those other forms themselves.

The British civil service has drawn the conclusion that young people should come into the service at an age when their

minds are open to influence by the individual character of government activity. This is a profession with its own proper characteristics. One illustration alone is permitted here. Some day a civil servant will have reached a point in his career where he is called upon to take a judicial decision in a dispute between men of lower rank and the state, or between private business claims and the state, or between two local authorities, in something like adversary proceedings. In that situation, everyone will claim that he ought to be judicial-minded. How are we to be sure of his impartiality unless he has received his training in the work of the department almost all his life, so that he not only knows the subtle factors involved and the laws and the practice, but also has attained control over his passions in the interests of impartiality? Much of the controversy over justice in the ordinary courts as against administrative justice revolves around this. Not that early entrance and life-long service are infallible conditions of judicial-mindedness: but is it better to be without any guarantee?

The American civil service is more impressed with the idea that the service should be open to anyone: that it should receive talent for a specific job wherever the candidate has mastered the written qualifications for that job. This idea ministers to employment opportunities. It also seems to promise freshness of mind, and specific work contributions. Yet it lets in men who soon get out; without a comprehension of their relationship to the whole administrative apparatus and to the President and to Congress; without a permanent interest in the service. All observers fear that it is not so much refreshing as disturbing. It has its values; it has its decided disadvantages. It is one of the chief factors making it impossible in the United States for federal service to be a "profession" of civil service.

*The Administrative Grade as a Career.* This leads directly to the problem of making the administrative grade a career. The British definitely establish a life career. This is a promise to the best minds of each generation that if they are con-

<sup>59</sup> *Big Democracy* (New York, 1945), p. 1.

tent to give up the chances of fame and fortune in the professions, in the arts, and in business, and if they devote their minds and consciences to the service of the state, they may look forward to hard work, intense mental exertion, creative endeavor, the building up of their country, a comfortable salary but not a fortune,<sup>60</sup> and a comfortable pension and social honor at sixty. This, in Britain, does attract extremely able entrants. By far the largest proportion remain and grow and are worthy of the high authority to which they finally are promoted. In the end they are the advisers of ministers: career statesmen, as it were. They are immersed in high policy and participate in the nation's most moving events.

Some American observers affect to believe that the seeming assurance of a career must result in mental rot. But this is simply a hypothesis or suspicion. The facts count: there is no mental rot. Instead, a very intense emulation prevails among the younger men in the depart-

ment; the opinion of colleagues in the service is a tremendous spur—a continual one—to enterprise and above all to mental exertion. Promotion is by no means certain; the approval of one's colleagues is contingent and very exacting; the rise to the permanent secretaryship is a considerable hazard of more than one in a hundred; ministerial rebuke or praise and indirectly by the House of Commons is always possible. The belief that men who enter a professional career will rot is an offshoot of social values which imply that men will not do fine work except under the lash of competition and dismissal, and the spur of material rewards. These values are not British values. Societies are different.

How can you recruit and keep four thousand advisers and assistants to the executive, and indirectly to the legislature, without offering men a career which will ask from them permanent and exclusive devotion, and require that they shall equip themselves in every way for their particular task?

Some men can be brought in as social need dictates at a later age, and so displace the chances of promotion of others already there. The British Treasury rules provide for this. The hazard is known. But if the proportion of those so entering becomes large, then the inducement to unqualified life devotion to the impartial and anonymous service of the supreme political authorities in the democracy has fled. You cannot have the cake of due mature, loyal advisership to the sovereign authorities, which they need as a life-and-death function of social democratic societies, yet eat up the cake by denying an assured career to the kind of people who will more surely give such service.

It is noteworthy that one of the experts, of long experience in political science and in the service of the Civil Service Commission, Sir Ernest Barker, threw out the suggestion that older men and women should be appointed to the top grade of the civil service, so as to make room for minds and characters nur-

<sup>60</sup> The salaries were to 1949:

Head of a major department .....	£3,500
Deputy head of major department .....	£2,500
Undersecretary .....	£2,000
Assistant secretary .....	£1,200 to £1,700
Principal .....	£ 800 to £1,100
Assistant principal .....	£ 275 to £ 625

The last three categories have a bonus of £60 a year for cost of living, to be amalgamated with the basic salary. The pound in normal times buys at least fifty per cent more than the American dollar equivalent. It may be remembered that it is designed that the "assistant secretary" and above categories should be reached at ages 32-40, 35-39, and "deputy head" and "head" at 40-52.

In February, 1949, changes were made as follows:

Secretary to the Treasury .....	£5,000
Head of a major department .....	£4,500
Deputy head of major department .....	£3,250
Undersecretary .....	£2,500

The change was made on recommendation of the Committee on Higher Civil Service Remuneration (Cmd. 7635), because (a) the burden of work and responsibility had increased, (b) the cost of living had risen, and (c) the new boards of nationalized industries and the specialists in the national health service are paid quite high salaries.

tured in social experience.<sup>61</sup> But when it came to the actual establishment of such a project, he became more tentative. A more recent proposal by writers who have themselves held fairly high civil-service posts recommends a regular recruitment of applicants from the public for positions fitting the age zone of thirty to forty. In addition, it is recommended that the Treasury experimental arrangement to recruit some twenty per cent of the entrance places into the administrative class from elsewhere in the service be made a permanent feature. Furthermore, it is the Treasury's postwar long-term normal rule to recruit some twenty-five per cent of the regular examination entrants rather more on the basis of personality than of supreme intellectual attainment. These arrangements go far toward remedying any stiffness which may have entered into the collective mentality of the administrative class. Yet there is still an undoubted and a justified anxiety whether if the arrival at high positions after years of service is narrowed and subject to more hazards by promotions from outside the class, and by new entrants in response to public advertisement, the attraction to the university generation will still remain as strong as hitherto. Time must test this.

*Recruitment Qualifications.* Of course, the foregoing observations lead directly to the problem of entrance qualifications. The American system virtually says to anyone, whatever his preparation, in whatever school, or business, or scientific or professional training: "If you can pass our examinations for this specific job, you can have a job; and you can get promoted to any other job if you do your present one well, as retirements and deaths provide vacancies." Thus technicians of all kinds can and do enter into positions where administrative qualities are needed: that is, where perception of intradepartmental problems arise for solution; where interdepartmental cooperation is needed; where fruitful compre-

hensive ideas for the progressive march of the whole function and public service department and the government are required; where advice of a part-managerial, part-political nature must ascend to the top; where the making of laws, and the high strategy of law enforcement, are all involved. It is a thousand-to-one chance whether the man taken in because he can do a specific job today will be the administrator who is needed in the new situation of several or many years hence. American students admit repeatedly that it is not a good chance. Yet they are overwhelmed by the feeling that the career ought to be open to anyone who now can fill the bill, and by a kind of tempestuous faith in the fresh-minded entrant, who will wake up everybody else in the service.

It is very reminiscent of the Jacksonian view, stated in his first annual message to Congress, that, "The duties of all public officers are, or at least admit of being made, so plain and simple that men of intelligence may readily qualify themselves for their performance . . ." When Jackson spoke, no brain was needed to guide the work of two million officials, or to devise the ways and means of securing a job for all, or giving parity to the farmers, or conserving natural resources subject to rapacious use by entrepreneurs, or equipping the might of America for the continuous task of making justice and peace prevail in the international order.

British ideas are different. They plan to recruit a great body of administrative statesmen, culminating in some forty permanent undersecretaries. That is their supreme concern: to provide the changing party cabinets with permanent expert advisers, and to enable ministers to rest assured that all matters of managerial detail will be handled by the secretaries once ministers have given their main propulsion to them. In the administration a kind of permanent counterpart to the political ministers is essential: to do all the thinking that ministers must do, and be aware of all the facts of which a minister ought to be aware and yet cannot be because he is not a career man in administration; to be the focus and bearer of

<sup>61</sup> Cf. W. A. Robson, editor, *The British Civil Servant* (London, 1937).

## CIVIL SERVICE AND THE VALUES IT SERVES

the science and technology and social considerations contained in the entire personnel of the department, and to garner the aid that can be brought to it from all other departments as need requires. This is the principal object of the British system, and it does it very well. We have already seen the mechanism by which these men, sometimes called planning officers themselves, or the men in charge of such planning and intelligence officers, are brought together in a central planning staff or as the official counterpart of committees of ministers acting under the immediate direction of the cabinet. Their integration is not merely the result of a specially established machinery of coordination, but their minds are already woven together by an approach to a common education. They begin with many common assumptions about human nature, as history and philosophical and literary study have taught them it, and this, in the province of high policy. Of course they have different outlooks; of course they have competitive ambitions; but of course they also have many ideas in common. Policy and co-ordination begin there. Administrative integration begins at college; it is seated in the mind.

To these great advantages, the British civil service must sacrifice the possibly remarkable administrative talent of some technician or professional worker, for normally (it sometimes happens) he cannot get to the administrative summit (though he may receive equal pay) which is reserved to those who have been educationally prepared and have thereafter followed the practical apprenticeship laid down for them on the ladder that leads to proficiency in the special office of supreme advisership to minister and Parliament. That that course is hard, well-designed, and effective is shown by the success of the arrangement, and the testimony of those with most intimate knowledge.<sup>62</sup> That it requires some improvement in detail, and occasional departures,

is no reflection on the main service rendered.<sup>63</sup> That a good technician will not be a splendid administrator is not thereby proved in general: he may be, but can you uproot a wholesale success on an individual chance?

*Admonition regarding Education for Civil Service.* It is a truth applicable to all civil services that the part that education can play in the preparation of an official is relatively small, especially if by education is meant only the years at college and university; and if all the years before that and the education in the family and all social activities and influences are omitted or underrated. To administer is to act, to make up one's mind, to influence other people to carry out desired policies, to combine and compound the ingredients in a situation so as to find the particular key that unlocks the obstinate door. It is the educational process as an opportunity of selecting from among the many who present themselves, rather than education as a direct making of an administrator that, perhaps, should be stressed. It is not the cognitive but the affective elements in personality that urge on to action. The truth of this is obvious from a glance at the list of qualities set down in the British and American civil service rating forms for the determination of efficiency for promotions or advancements in salary. (p. 858 ff.) It will be noticed that perhaps seven out of ten of the qualities are not educable, that is to say, while it is possible to describe them and perhaps to devise exercises in them, they are almost uncontrollable inborn psychological and even physical qualities. This means that the process of selection is even more important than has hitherto been admitted.

### THE CIVIL SERVICE AND THE VALUES IT SERVES

THE discussion of the recruitment of the higher civil service of Britain could not have failed to awaken the sense that we

<sup>62</sup> Cf. H. E. Dale, *The Higher Civil Service of Great Britain* (London, 1941).

<sup>63</sup> Cf. Report of the Committee on Training of Civil Servants (1944).

have not been concerned with a merely utilitarian instrument of a materialistic society. Values have been suggested which go beyond so limited and ungenerous a function. The civil service obeys a government but it serves a society, an ancient corporate personality with life today of a myriad facets, and a future of spiritual as well as the grosser needs. The British conception of its civil service is the British conception of government and civilization as a whole; for good or ill it is not a hand-to-mouth affair, nor a helter-skelter improvisation of a handful of administrative mechanics armed with a few brash generalizations about intelligence tests, efficiency records, rating scales, and the husks of a knowledge of human nature gathered from a hurried study of organization charts. It is not a temporary camp of prefabricated dwellings to which anyone may easily repair and may shortly leave. It is rather like a stately home designed with many wings, housing standards and conscience, and built to last many generations. It incarnates a pattern, a design, a concatenation of values, for living in its entirety, embodying values and graces beyond the materialistic only. Burke best expressed its inward parts in his *Reflections on the French Revolution*:

... the state ought not to be considered nothing better than a partnership agreement in a trade of pepper and coffee, calico and tobacco, or some other such low concern, to be taken up for a little temporary interest, and to be dissolved at the fancy of the parties. It is to be looked on with other reverence: because it is not a partnership in things subservient only to the gross animal existence of a temporary and perishable nature. It is a partnership in all science; a partnership in all art; a partnership in every virtue and in all perfection. . .

Clearly the manning of such a dynamic partnership cannot be left to chance or to narrow views of "efficiency." The higher civil service of Britain seeks permanent statesmen—that is its problem. That they are in part managers as well as statesmen is true and certainly makes the problem more complicated; but it is even more certain that the quality of statesmen will

always be the paramount quest, since that is the deepest need.

Roger Ascham's *The Scholemaster*, published in 1570, not so long after Columbus discovered America, wrote this tribute to Nicholas Metcalfe, the Master of St. John's College, Cambridge, who died in 1539:

This his goodnes stood not still in one or two, but flowed aboundantie over all that Colledge, and brake out also to norishe good wittes in every part of that universitie: whereby, at his departing thence, he left soch a companie of fellowes and scholers in St Johnes Colledge, as can scarce be found now in some whole universitie: which either for divinitie, on the one side or other, or for Civill service to their Prince and contrie, have bene, and are yet to this day, notable ornaments to this whole Realme.

Hitherto, a considerable proportion of the entrants to the administrative class have been the sons of the high professional classes and, some, the members of the aristocratic families; quite a number have come from clerical families. In all of these has reigned a high sense of moral purpose; and this is cultivated at the universities, which have been residential. Graham Wallas, my teacher, himself the son of a religious minister, used to refer to men of this sort as "secular saints." It would be fulsome to apply this term indiscriminately. But the names of Trevelyan, Mowat, Eyre Crowe, Sir John Anderson, Lord Beveridge, Harold Nicolson, Oliver Franks have attained wide public fame. Hundreds of their counterparts, less well-known, attest the enduring public spirit of the administrative class, their devotion, and the conversion of their parents' religious into a secular ministry.<sup>64</sup> There is no indication that the new

<sup>64</sup> I refer for illustration to Bernard M. Allen, *Sir Robert Morant* (London, 1938); Lord Beveridge, *The Beveridges in India* (London, 1938); Cyril Connolly, *Enemies of Promise* (London, 1935); Dean W. R. Inge, *Vale* (London, 1934); *Sir Oswald Murray*, by Lady Murray (London, 1936); Beatrice Webb, *My Apprenticeship* (London, 1926) and *Our Partnership* (London, 1948); Harold Nicolson, *Lord Carnock* (London, 1930); and much may be learned from Sir Ernest Barker's *Father of the Man* (London, 1948), for he has been a

## CIVIL SERVICE IN THE CONTEMPORARY STATE

classes that are now entering the service have not inherited this devotion to the public service, which implies a large subordination of self to the present and future welfare of the great community, a fulfillment of self by assisting the establishment in the community's focus, the state, of more justice, more charity, more abundance, less pain, a fuller consciousness of truth.

### THE CIVIL SERVICE IN THE CONTEMPORARY STATE

Do the expansion of state activities, the nationalization of the basic industries, the planned regulation of all others, the management of all-comprehensive social security, the objectives of full employment and deliberate progress toward a rising standard of living, impose an important change in methods of recruitment of the civil service?

The answer can depend only on the difference, if any, in the nature of the task of the government. Four changes may be discerned, and it will be observed that they are of degree rather than kind.

(1) The functions of government have changed in scope: a much more comprehensive intervention in social life has occurred. This change dictates the need for imagination of relationships among the branches of the government, the departments, and the agencies. Is this new? Between 1832 and 1948, is an enormous contrast: but is there much contrast between 1928 and 1948? Some contrast there is, and it is of importance. But civil servants have been coordinating for decades. The awareness exists, and if it did not at the official level, it would be speedily brought home at the cabinet and cabinet-committee level. It might be rejoined that it is from the civil servants that cabinet ministers must obtain their understanding of the need for coordination: this is true, up to a point; each helps the other, or averts mutual hindrance. Some clearer consciousness of the width and the compli-

cated problems in coordination, an extra alertness about this, a rising emotion about it, are required. This can be given in one or two courses at college, or in the in-training period now established by the Treasury. It calls for no important change in the general education and recruitment methods of the service. The need is partly met by the establishment of the Central Planning Staff, which, being rooted in the officials of the various departments, must agitate an everyday awareness of the responses each departmental group of officials must make.

(2) Contemporary state services place more emphasis on the future. Nearly all of them require the government to forecast what the great public groups will do. The officials must take the statistics of the past, carry them forward for a recognition of trends, and then ask themselves what probabilities of future behavior will vary the trend. This is a cardinal task of planning. Indeed, guesses must be made about the variables cleverly enough to judge what statistics must be gathered in the first place: for these will be gathered in order to assist in finding answers: the problem properly defined is half the answer. Sir Oliver Franks has stated the matter, from personal experience, in these words: <sup>65</sup>

'The second [danger in planning activities] is to forget the real nature of the economic activities to which the planning refers. Since central planning concerns the future and what can be done with it, it is necessarily occupied with extrapolation from the present. Trends and tendencies must be isolated and analysed so that forecasts may be built up and estimates made. This cannot be done by purely intellectual processes: or if it is, the results are certain to be unreal and bad guides for practice. An awareness of how things happen is required, of the interrelations of commercial and industrial processes, of the factors which enter into the business decisions of business men. That is why good forecasting and estimating is an art though using all the scientific techniques that the study of statistics has made available. It is not the art of what wartime nomenclature called the back-

teacher of aspirants for the civil service and an examiner for the Civil Service Commission for some forty years.

<sup>65</sup> *Central Planning and Control in War and Peace* (London, 1947).

room boy. It requires knowledge of the world as well as highly specialized training. It is no criticism of the Civil Service to say that it has not enough experts of this kind. There are not enough in existence. But it must be the first concern of the Civil Service to increase their number if there is to be central planning and control in peace.

How can the "awareness of how things happen" be taught in a university to undergraduates of the normal youth of undergraduates? It cannot be, by hypothesis. And as we look at postgraduate students, several years after their undergraduate education, can we believe that they have acquired an "awareness of how things happen"? We cannot. They are both raw material. Is the answer then to bring in men from the outside as a regular wholesale procedure for recruiting the civil service? They cannot surely have mastered more than one trade, or two? Can we be sure that they could be employed exactly where their awareness would fit? There is a case for bringing in some from outside—a proportion of the total recruited annually, and the procedure of choice must be exceedingly careful so that in the search for those who know how the business mind works, there may not be lost to the service some kind of mind at all. The solution lies in the proposals already advanced, that a proportion of the higher civil service be recruited from the outside in the age zone of thirty to forty; that a fair proportion rise from the other grades of the service; and that all, once in the service, be given training, with opportunities every few years of travel and first-hand observer-participant experience in business. If this does not help toward discovery of the personnel needed, no other road exists. It is clear, however, that promotion policy must be directed toward keeping out of the positions requiring the specific awareness we are discussing those who have not the kind of talent which fits the situation or can be trained for it.

(3) If these requirements were met, they would take care of the third characteristic of administration in the planned state,

especially the British, whose prosperity is precariously poised on its imports-exports balance: speed of reaction to the first signs that the future is in movement. It seems unavoidable also that even if it is not desired to change the traditional principle of recruitment—namely, that candidates shall be examined in the subjects they themselves have freely chosen to study—and even if emphasis is still placed on the humanities (which I hope it will be), a strong case exists for requiring the subjects of government and economics. If this is not feasible before, then rigorous study of these subjects must be required after, entry into the service.

We now turn to the final quality which has become especially important in the planned state: practical initiative. Nothing was more significant during the debates on the nationalization of the Bank of England and the coal industry than the unanimity of House of Commons opinion that these industries must not be recruited "like the civil service." It is not fatally sure that a unanimous House of Commons is always right. It was, at any rate, not clear and specific in its anxieties. Civil servants hitherto have in many situations been obliged to take the initiative. It is difficult to think of any who are not required to, and that with continual promptitude. In any case, the nationalized industries have their own free recruitment methods, almost as free as any private corporation. (Whether they will be able to maintain it so over a long period is another question.) Is there a difference in the kind of initiative between the action of a Ministry of Health official in conducting an inquiry into a slum-clearance scheme, and an official of the Ministry of Fuel making sure that the complaints of the consumers' councils in the coal industry have stated their case and have been properly heard by the ministry? It would seem not. Is there a difference in kind between a land-purchase agent of the government buying land for a government storage-house in 1928 and in 1958, just because at the new date the goods to be stored are cotton

bought and sold by the government? I do not think so. Is a new kind of treatment required where a regional export council (a representative body) must be urged and persuaded and invigorated by an official of the Board of Trade? Yes, undoubtedly. Is there a new kind of initiative required in deciding that more money should be invested in coal or transport? Hardly; for the proposition would come from the boards concerned, and high Treasury considerations would be involved. But perhaps a suggestion might come from the Treasury, when someone would have to initiate it. It would seem then that the answer is complicated and mixed. It is mainly to be answered by the methods of promotion, transfer, and training, and the training itself must insist on the need for a mood of alert prediction in the civil service. There will be much occasion—in a state which follows the general policy of full employment and a rising standard of living and equalized distribution—for the higher civil servants to cogitate and to digest and prepare suggestions of policy to implement the major decisions made by ministers and the House of Commons, and to make pioneer suggestions which emerge from the close scrutiny of practical and spiritual trends.

Yet all these things do not seem to me to add up to a case for departure from the main traditional principles of recruitment, though they do for their intelligent and rational qualification. For part of the difficulty is the wholesale nature of state activity. It is impossible to find a separate appointing process for each in-

dividual civil servant, fitting him to the particular job which is vacant. Even if this could be done, one would be dogged by the next attendant problem of following that same civil servant, individually, through the promotion stages up the ladder of responsibility; and if one were so followed, all would need to be. The permutations and combinations would elude the most elaborate form of control over appointments and promotion. No legislature could exercise its right of control over the appropriations for its civil servants if such individualization were carried out: how could they compare men and jobs and salaries? And, therefore, a radical change is not only unnecessary but infeasible.

Finally, to put all the emphasis on the civil servant is to commit a grave error in proportion. The stimulus to initiative in the planned state comes from the political parties; from the organized producers and consumers, the workers who want more money and less hours and better conditions on the job, and the various groups of consumers who in some cases (like coal, credit, houses, transport, electricity and gas) pay a price for the service or commodity; from the minister who wants to make a good showing in the eyes of Parliament and the public; and from the House of Commons that has the right of asking questions and making its will prevail. If all these institutions, and many more, remain alive and virile, they will continually provide stimuli to efficiency and initiative which cannot be ignored by officials of even average conscience.

## *Recruitment in Germany in the Nineteenth and Twentieth Centuries*

INEXORABLY the spiritual and material conditions of nineteenth-century civilization began to affect the recruitment of the public services. Inexorably, but only gradually, and with much opposition from obsolescent ideals and vested social interests. An extraordinary break came round about 1875: the countries in which modern industry and the modern spirit had come to their most vigorous and self-conscious efflorescence then made sudden haste to renew their civil services, for the logic of industrial and commercial efficiency was irresistible. In the chapters which follow we continue to sketch the general development of the administrative services with special attention to the methods of recruitment. We are primarily interested in the branch of the civil service which shares in governing—that is, the higher administrative class. It is in this respect that modern states show differences, and characteristic differences; and that the evolution of the modern state is best observable. While, therefore, tracing the general assault upon patronage and the state's adjustment of its machinery to its purposes, we shall (1) deal with the higher services first, then (2) compare them and try to estimate the significance of their development and ultimate results, and (3) indicate, but very briefly, the solutions adopted for the subordinate classes.

### THE RISE OF LEGAL TRAINING: TO THE 1870'S

AFTER the reforms of the French Revolutionary period, there followed a time of conservatism and consolidation. In old Prussia the civil service was a nationwide and continuously operative economic institution. Its training had been adapted to its functions. But between 1815 and the last quarter of the nineteenth century a number of new conditions caused a very vital variation of the mode of recruitment. A vast mass of legislation, as distinct from administration, was required to meet social and economic needs. The state was renewing itself, and the duties and rights it was creating to accomplish this were often in the direction of freeing industry and commerce from its regulation. While, therefore, it was not adding to its administrative work it was making law, and it felt the strong need for civil servants with a good legal training, and, moreover, a training in private law. Again, since administrative law and its procedure were being sedulously developed, great importance was once more attached to legal training. Further, the constitutional struggles had for their object the legal restraint of arbitrary officialdom, and Parliament saw in a legal training of officials a good means of teaching them a practical respect for law. This, the legal restraint of officials, was the German idea of the "rule of law,"

## THE RISE OF LEGAL TRAINING: TO THE 1870's

a substitute for the "rule of law" in the Anglo-Saxon political tradition, namely, that no official could act otherwise than under the authority of a popularly responsible legislature. The Germans called it the *Reichstaat*. Nor were the individualists in this very temperate heyday of German *laissez faire* unready to secure limitations upon the activity of the administrative official similar to those of the judge.

Until 1879, therefore, the old practical and cameralistic preparation suffered continual modification which favored legal studies. The authentic note of the eighteenth century is still heard fully in the Prussian instruction of 1808. Candidates are expected to have studied thoroughly political science (*Polizeiwissenschaft*), technology, statistics, experimental physics and chemistry, botany and agricultural economy, and to have had the opportunity of acquiring practical knowledge of the most important trades, especially of the agricultural. They were no longer required to have worked in one of the domain administrations. Their examination was written and oral and they were accepted only if "they combined thorough theory in the required sciences with a sound, well-exercised judgment."<sup>1</sup>

In 1817 a change is already observable. Besides the preparation in the usual branches of knowledge, in languages ancient and modern, in history and mathematics, there is required thorough knowledge of the law, at least some practical knowledge of agriculture or some other chief industry, and as far as possible practical work as auscultator in the courts. The effect was not to put law into the foreground, but it was certainly to introduce a competing element and a relative depreciation of the position of the social sciences. However, the decisive change in emphasis did not come until 1846 when practice in the law courts became the rule and in agriculture or industry the exception. The chief requirement now became practice in the law courts and

the passage of the second examination in law for entrance to the superior courts. All that was now required of the cameralistic and agricultural sciences was "at least general acquaintance" therewith. Finally, there came the decisive "second examination" for the attainment of a permanent position, as *Regierungssassessor*. This examination was written and oral; the former consisted of three theses, one dealing with a subject of political science, another of administration, and the third of finance, the latter two being of a more practical nature.

By 1846, the predominance of legal studies was firmly established, and the final break had been made with the eighteenth century.<sup>2</sup> Most interesting is the downfall of the importance of agriculture. As interesting, too, is the cessation of practical work in agriculture and industry as a preparation for public service. It betokened the conscious withdrawal of the state from positive economic and social activity. The social sciences ceased to have their old importance as the foundation of a civil servant's training, but worse still, their cleavage from actual practice caused them to become excursions in the literary history of theories. They became less a scientific preparation than an exercise of memory, and the universal weed which forms upon the soil of circumscribed and theoretic studies, the "coach" or "crammer" appears, without resort whereto it was now almost impossible to pass the examination. In 1866 it became necessary to reconsider the Regulation, partly owing to public and parliamentary criticism but more particularly owing to the extension of Prussian rule.

The law of 1869 regulated entry into the higher judicial service, by abolishing the intermediate law examination at the universities, and setting up only two examinations, the first, the university law examination taken after at least three years' study, and the second, the great state examination, taken after at least four years of preparatory service. Until 1879, administrative officials were re-

<sup>1</sup> Clemens von Delbrück, *Die Ausbildung für den höheren Verwaltungsdienst in Preussen* (Jena, 1917), p. 6.

<sup>2</sup> *Ibid.*, p. 8 ff.

cruited from the judicial assessors trained in this way. These judicial officials might have received a one-year's training in an administrative department as part of their four years' preparatory service: this was the intention of the government, but the Prussian Parliament rejected the proposal as it feared the undue influence of the executive.<sup>3</sup>

We now come to a period in which the position of legal studies is consolidated, but no sooner is it consolidated than parliamentary and public critics are compelled to criticize the efficacy of legal studies as a preparation for the administrative work of the modern state. Moreover, university teachers of law became thoroughly dissatisfied with the nature of the curriculum since they realized that it may have serious effects upon the efficiency of the service. A very lively controversy therefore begins, as to the scope and method of legal studies.

## LEGAL TRAINING SUPPLEMENTED: THE PERIOD TO 1920

GERMANY was now full in the strong current of industrial civilization and the sense of state activity which had weakened a little between 1815 and 1870, but had never fundamentally suffered, now not only recovered its old strength but went beyond it in scope and energetic persistence. The higher officials' experience had taught them that the best administrative officials were to be obtained by a special training in which the study of economics and finance at the universities and the acquisition of exact knowledge of the conditions of public life and administrative law and practice during preparatory service were of equal and high importance. A government measure before the Prussian Parliament in 1874 acknowledged the necessity of a special preparation for higher administrative officials. It admitted that the entrant to the service could not obtain a knowledge of administrative institutions and adminis-

trative law at first hand: the more, in fact, that he devoted himself to law, the less would he be able harmoniously to relate written law and the practical necessities of life. A thorough knowledge of the indispensable sciences of economics and finance could only be obtained by their early, long, and serious study, and, as an adjunct of legal studies, would be entirely insufficient. Further, the Diet suggested the application of these proposals to the chief presiding officials of the local government areas<sup>4</sup> as well as their immediate subordinates, who alone were affected by the government proposals, and recommended that in the Ministries of the Interior and Finance only persons who had acquired the qualifications for the higher judicial service should be appointed.

*Law Education versus The Social Sciences.* After prolonged debate, open and occult, the Prussian Diet, the House of Peers, and the government arrived at a compromise.<sup>5</sup> The regulations applied to divisional directors and members of a government district, and the higher administrative officials adjoined to the over-presidents and government-district presidents, with the exception of justiciars and the technical officials. It may seem strange to the English reader that the regulations concerned what appear to be primarily local officials, but, indeed, such a mixture of central and local government powers were exercised by the authorities we have named that, in the present context, and in almost every other, they are to be regarded as departments of the central authority operating outside Berlin for a limited part of the territory. In any case they were until 1879 (and to Hitler's time they still were) the first office held by aspirants to the higher administrative departments; thence, after a preparatory period, they might be promoted to the central departments. The regulations were not made to apply to presidents of

<sup>3</sup> Cf. Friedrich von Schwerin, *Die Befähigung zum höheren Verwaltungsdienst* (Berlin, 1908), p. 5.

<sup>4</sup> That is, to presidents and divisional chiefs of the *Regierungen*; *Landräte*, *Kreis und Amtshauptmänner*, and *Oberamtmänner*.

<sup>5</sup> Law of March 11, 1879, and regulations of May 29, 1879.

the government districts or to the over-presidents of the provinces or to ministers.

The rules relating to training persisted until 1906, and were until then the object of controversy, and after certain reforms in 1906 continued to dominate conditions until the Revolution of 1918. The main provisions of the law were as follows: the qualification for entry into the higher administrative service was at least a three-year university course in law and political science; and the passing of two examinations. The first examination was the legal examination as prescribed in the law of 1869. The second, the state examination, was to take place before the "Examination Commission for Higher Administrative Officials." The second examination was preceded by a preparatory period of two years in the courts and at least two years in the administrative departments. Preparatory service took place in local government, urban and rural. The subject matter of the second examination was Prussian public and private law, and economics and public finance. The examination was written and oral—the written part consisted of two theses—six weeks, or a little longer, being allowed for the completion of each.

Very little had been accomplished by this law to meet the nature of the claims which society was beginning to make upon the higher branches of the civil service. Had it not been for the Prussian Parliament's fears, a separate examination might have been created based upon the social sciences. But in the existing state of politics the Parliament could only credit the government with the intention of using such an examination to reject "undesirable elements."<sup>6</sup> The result was that, in practice, law still retained a favored position. At the examinations very little emphasis was laid upon knowledge other than that which was directly legal, and in the best of cases the social sciences were introduced only as subordinate to law. As there was no special examination for these subjects, there

was no certainty at all as to the attendance of the candidate at lectures. The natural result of the regulations and their busy apprenticeship made it impossible for them to do justice to the social sciences without the generous help of a "crammer." Two things had, however, been gained: it had been admitted that the legal and the administrative careers were separate and ought to be prepared for differently, and provision had been made for an apprenticeship period with the local authorities. Criticism came from two sources: from the universities which were teaching law and economics, and from practical statesmen, in office or in Parliament. It is instructive to review briefly the nature of their argument.

*The Universities.* It is quite obvious that if civil servants are selected by tests based upon a certain prescribed university training, the value of that test is to be sought in the actual nature of the training. Between 1879 and 1906, and even after this date, the universities showed many signs of serious dissatisfaction with the manner in which students applied themselves to their work, and with the intrinsic value of the law studies. Among the critics were Schmoller, Gneist, Gierke, and Jhering, and there were many others whose reputation, though not as world-wide as these, yet counted for much in Germany.<sup>7</sup>

*The Defects of Legal Training.* The gravamen of their charges was this. The teaching of law had fallen into a state of sterile dogmatism.<sup>8</sup> Where the theory of law was taught at all, it was not kept in a wise relationship to the actual law as it appeared in everyday practice, but was not seldom composed of a fabric of doctrines based upon a tissue of major premises untested by reference to the nature

<sup>7</sup> The whole subject is treated, and the views of the principal contributors reviewed, in *Rechtstudium und Prüfungsordnung: Ein Beitrag zur preussischen und deutschen Rechtsgeschichte* (Berlin, 1877), by L. Goldschmidt, judge and professor of jurisprudence.

<sup>8</sup> Cf. Adolph Wermuth, *Ein Beamtenleben* (Berlin, 1922), p. 31 ff. This goes back to 1880. Wermuth became Secretary of the Imperial Treasury, and *Oberbürgermeister* of Berlin.

<sup>6</sup> Cf. Von Delbrück, *op. cit.*, p. 15.

of social life. Analytical work, in which history and economics were used to explain the growth and operation of the law, was very rare, and this lack exercised an unfortunate influence upon seminars and lecturers. The main cause of this dry abstract and detailed dogmatism was the nature of the Prussian legal codes: they were isolated from the surrounding life of the other Germanic European states, they were neither the perfect continuation of the old German customary law nor corollaries of Roman legal principles, but curious mixtures tinctured with the theories of the men—great men, of course—who had written them. Their very minuteness of detail inhibited mental elasticity in their treatment. Only the great teachers could rise above the compulsions of these codes. The student was then apt to be trained to repeat a number of formulas, obtained no grasp of legal principles and, therefore, since he had an examination to pass, learned to pass it by a short period of concentrated memorizing. This was quite natural, since the most successful conditions for memorizing are definite dogmas and the stimulus of an approaching event.

If the law were to be taught with due attention to its sociological nature, a period longer than the prescribed minimum of three years was essential. Neither law by itself nor law together with an adequate preparation in economics and political science could be mastered in less than three and a half years, some said in four. And even the three years then prescribed could, at that time, be reduced to two, as the one year's service in the army was counted in.

It is common knowledge, of course, that exceedingly great care has to be taken in the teaching of any nonexperimental faculty. The student is obliged to occupy a merely passive and receptive position toward the teacher, and a large variety of devices must be consciously used to stimulate attention and awaken cooperation. Of all such nonexperimental studies law has, perhaps, the hardest task in getting itself accepted by the average student. Most humane of all in its social effects, it

is least human in its form. It tries the mind and tires it. The most successful law school in the world, Harvard, has succeeded in solving the difficulty of vividly interesting the student only by converting the student into a judge and the seminar into a court for particular cases, by the case method.<sup>9</sup> Only a very few gifted teachers in Prussia had made an approach to such a system, and, for the rest, the students, finding that their lectures were merely expositions of what was already exposed in textbooks and commentaries, spent their time in riotous living and passed their examinations by memorizing laws, but not learning law. For this we cannot entirely call the teaching to account: the traditions of studentship have a great deal to answer for. This was followed by a "cramming" establishment.

The students, in the fashion still permissible in Germany, divided their three years among various universities. There was no means of controlling their work or attendance at lectures, and when the first examination threatened they gravitated to the university in which conditions were easiest.

Those whose social antecedents proved satisfactory to the high local and judicial authorities to whom they applied for admission into the preparatory service then spent their time in a minutely regulated order of duties—regulated, the law of 1869 declared, to give the novice experience of all branches of judicial practice—the bar, the notary's office, judgeship, and office work. All this in four years! The result, says Goldschmidt, was only to reduce real talent to pettifoggery routine. (It did, in fact, drive both Bennigsen and Bismarck out of the service.)

We have already said that economics and political science became the hand-

<sup>9</sup> And even this entails the penalty that the student loses, or rather never acquires, a sense of the whole system of law and its total significance in the social order. Cf. Josef Redlich, *The Common Law and the Case Method* (Carnegie Foundation, Bulletin No. 8, 1914); also cf. R. Valeur and E. Lambert, *L'Enseignement du Droit en France et aux États-Unis* (Paris, 1929).

maiden of the law. Students learned that few, if any, questions involving real study were likely to be put to them. These studies, then, were given only perfunctory attention, although the law required satisfactory knowledge of "the principles of political science." The universities, conscious of their importance as preparatory and selective institutions for the judicial and civil service, frequently expressed the wish to make more of these studies. But the examination is the only effective sanction of such a policy, and the examination did not demand this knowledge. Law had become divorced from its origin and its purpose, and a narrow and pedantic formalism had invaded a field in which pre-eminently the truth of real life is essential. This evil was unfortunate for the judicial service, but since the preparation for the judicial service in its first four years or so was also the preparation for the administrative service, it threatened to become disastrous for the latter also.

The truth was that economic life had taken such a direction that the state was bound to interfere with its processes, and this interference could only be properly carried out by appropriately trained officials.

Yet the predominance of law did blight the student who aspired to the administrative service. He did not appear before a Judicial Court of Examiners, but before the "Examination Commission for Higher Administrative Officials." The examination was to determine whether the candidates could be considered "capable and thoroughly prepared successfully to occupy an independent position in the higher administrative service." But they had, excepting for their two years, followed the same course as their judicial colleagues, and their choice of ultimate career was not always decided upon until the latest possible time, that is, after two years of preparatory judicial service. Further, the final examination was taken before practicing jurists, at the most a teacher of law was included, but never a teacher of political science.

*Political Critics.* Bismarck found the

civil servants of so little use that he set up an Economic Council.

In the 1890's the desire for reform became widespread. From now on the discussion of faults and remedies became of radical importance since the problems disclosed are elemental and affect all countries. Public discussion was first initiated by the Finance Minister, von Miquel, in 1895. He suggested a reduction of the time spent by administrative officials in the judicial service from two years to one, so that they might have a longer time in which to learn administrative law, social policy, economics, and other branches of science. The long time spent in the courts merely took away from the time which should be devoted to that which was ultimately to be the life career.

A lively discussion in the press followed, and in 1902 the government introduced a project into Parliament. The main object was to lengthen the university course to three and one-half years and to reduce the preparatory course to the same period. After much delay the government conceded a reduction of the work before the courts to nine months for civil servants. The overwhelming opinion was that it was very desirable that at least a part of the time should be served in nonstate institutions: like the Chambers of Agriculture and Commerce which on the Continent have an official representative status.

*Away from Mere Book-Knowledge.* This is the problem which has arisen wherever sincere thought has been bestowed upon the question of properly training officials: How to overcome the natural effects of book knowledge? Can it be left to the student's own devices? Ought there to be a preparatory period in the service—or outside the service? Will travel be of value? The necessities of the modern civil service go further: it is not enough that officials see the levers they have to pull, but that they should be vividly acquainted with the nature of the enormous tangle of objects and men attached to the other, the invisible, end of the lever. Plato long ago warned us not

to teach with our backs to reality and our eyes only upon moving shadows.

Public discussion revealed clearly the most important fact which had caused perturbation before and which has since been the subject of anxiety. "In Germany," the minister said, "officials attain to responsibility and independence at too late an age." In other countries the young man of thirty was already in the center of independent activity, and even in Germany, in other professions, the man of thirty could look back upon a number of years in which freshness, resolution, and energy had already accomplished a great deal. This raises a question of great significance.

From 1906 to 1920. The result of the discussions was the Act of 1906, in which the main lines of criticism were given effect. This act functioned until 1920. Let us imagine that we desire to enter the administrative service after 1906.<sup>10</sup> We would be obliged to take at least a three years' course of law and political science at a university and then take the first law examination at school. Our university teachers are hardly satisfied with our stay at the university for only three years, but the government holds that as we spend more time in this way, we shall ultimately enter upon our duties at an age when all our freshness of mind is gone, and when, therefore, they can do very little with us. Now while we are at the university, it may be true that we shall be wasting some time—perhaps a good deal—if we join one of the students' corps,<sup>11</sup> but it will more than repay us in the long run, since relatives and friends, even people who

are not related to us who once belonged to the same corps, will give us a helping hand and will prefer us to other candidates, other things being equal or even more than a little unequal.

The final examination comes. The subjects are public and private law, legal history, and principles of political science and economics. The examiners are by statute instructed to explore our knowledge and insight into the nature and historical development of law, and to see whether we have a general legal and political science education necessary to our future profession. We now approach our four years of practical work, and it is fortunate that we are not of the generation before 1906, for they were obliged to serve two years in the law courts before proceeding to their real work; we have only to serve one year in the courts, and this may be reduced to nine months by the Ministries of Finance and the Interior. We stand no chance of entrance to the next stage unless we are Protestant, anti-Socialist, of "good" family: that is, if we are Catholic, or Jew, or Socialist or otherwise of Left-wing politics, or are of working-class family.<sup>12</sup>

The year or the nine months pass. They were not wasted. For the courts to which we were attached—the *Amtsgericht* or the *Landesgericht*—gave us a very good insight into procedure and administrative law in actual practice. We have now to be accepted into the preparatory service by the president of one of the fifteen prescribed government districts—an official of high status and important powers. Our English colleagues have no such arrangement as this whereby an authority other than the central departments chooses us. And, in fact, the practice in Prussia has not been quite unchallenged. It is the ancient Prussian practice, but suggestions for modifying it were made in 1875 and later. The government as a rule wanted to leave the matter as it is today in order to avoid burdening itself with duties which can be quite well performed else-

<sup>10</sup> This description is based upon the best two commentaries: upon von Schwerin, *op. cit.*, then member of the Examining Commission for Higher Administrative Officials; and Wandersleb, *Die Befähigung Zum höheren Verwaltungsdienst* (Berlin, 1927), then, assistant secretary in the Prussian Ministry of Commerce and Industry; and upon private information.

<sup>11</sup> Cf. for a good description of student life in the Corps, Hermann Sudermann's novel, *Der Tolle Professor*; also Presber's *Mein Bruder Benjamin*; see also G. Michaelis, *Für Staat und Volk* (Berlin, 1922), and Bismarck's *Reflections and Reminiscences*, the first few pages.

<sup>12</sup> Cf. another angle, I. W. Muncy, *The Junker in Prussian Administration* (Brown University, 1944).

where, and its parliamentary supporters argued appointment by the government as futile. For the ministers could not possibly know enough to exercise a proper choice, whereas the local authorities who were responsible for the practical preparation of the candidate could more justly take the responsibility of choosing. It was further feared that central appointment would result in political higgling, since the central authority was subject to a great deal of parliamentary pressure. On the other side it was emphasized that central choice would mean uniformity of principles and a cessation of misunderstandings and suspicion about the motives of the president of the government district.

The three and a quarter years of preparatory service are so regulated as to give a conscientious servant a splendid opportunity of acquiring wide experience. The sanctions available to the president are such that any servant who ultimately stays in the civil service is certain to have made good use of his time; for the president may put off the final examination and, in cases of gross misbehavior or waste of time, even dismiss the referendar. The three and a quarter years are divided up as follows: twelve months with a *Landrat* (the executive officer of a local government area known as the *Kreis*), three months with a small popularly elected or municipal body, at least fifteen months with the government district Authority, and the district committee (*Bezirksausschuss*). As referendars, we will be placed in those local authorities, urban and rural, where we shall get an opportunity to survey a wide field of administration, to see the whole process of government in a particular area. It is probable that we shall be sent to a municipality of the first and second size and there we shall be overwhelmed with the enormous scope of its work and finish by being confined to some special branch only. If the opportunity occurs, we shall be made deputy of the head executive official—like the *Bürgermeister*—for a time, and every attempt will be made to awaken the feeling of self-sufficiency and responsibility.

Care will be taken, according to the Rules, to give us work and explanations which will systematically promote our understanding of the social sciences, though attempts will be made to avoid weighing us down with details. When we are in the government district authority, our work will be so organized that we shall see the whole field of its activity, including the educational and financial division, but wherever a particular situation is not calculated to add to our comprehension of principles we shall be spared. Our apprenticeship will stretch from thorough occupation in the registration and accountants' office to the making of verbal reports in departmental meetings, and traveling commissions to state and non-state institutions. In the subdistrict of the government district—the *Bezirk*—we are employed for many months, since here it is possible to take a continuously active and rather significant part in the work (the authority is, of course, not nearly as important as the *Regierung*). Every authority under which we serve makes a report upon us, and the *Landrat* pays special attention in his to our relationship with the public in the district. A final and comprehensive report is made by the *Regierungs-Präsident*, and all the reports are put before the examination commission.

The *Regierungs-Präsident* decides when we are fit to take the final examination. This is done by requiring the apprentice to make a considerable report upon some subject arising in the course of his work. There is no legally stated field of investigation; it is left entirely to the president and the referendar to determine. It may be on the practical or the theoretical side. It may be financial or institutional. But it is desirable that its preparation should require a thorough acquaintance with constitutional and administrative law.

*The Final Examination.* The final examination is written and oral, and extends over the public and private law valid for Prussia, and, further, constitutional and administrative law as well as economic and political science. The ques-

tion of all questions is: Is the referendar likely to be able to act independently and successfully in the higher civil service? Has he a sound enough grasp of the duties and purposes of the state in economic and financial matters? On each of two days we write a dissertation on a topic (till then undisclosed) with the aid of certain reference books which are provided in the examination rooms. A third day is occupied in the preparation of a verbal report. Then follows an oral examination. A candidate who fails may reappear once more; a second failure is followed by exclusion from the higher civil service.

The striking feature of the topics set for examination is their extreme practicality and technicality, and their wide range. Not that all are technical: some are upon the history of economic and social theory. The vast majority ask for judgments upon a narrow set of circumstances; the answering of these clearly demands a fund of exact knowledge, a firm grasp of legal and economic principles, comprehension of the conditions of the effectiveness of institutions, and the ability to focus correctly the general light of science on particular cases. Little or no room is left for metaphysical adventuring, and the confines within which doubt and curiosity might arise are rather narrow.

On the whole, the German procedure compared with the British shows a wide and important variation: the German being based much more upon the correct use of authorities, the British more upon personal judgments. If this diagnosis is correct, the situation it reveals is important, for it may be that much of the formalism with which German bureaucracy has been charged by native critics was due to the spirit and training which have their expressions in this type of examination—nay! to the ultimate view of private and public life which engender these. The examiners believed that these were the proper questions to ask, they held this belief because they had a mental picture of the kind of civil servant they wanted to secure: men learned to the point of pedantry, and logical. This produced civil

servants more useful in a static than a dynamic state; excellent interpreters of the past but not inventors of the ways and means of the future; apter to explain than to evaluate; and inflexible in the power to make exceptions—which is nine tenths of administration. Where the Germans are lacking the British are rich, but the British have their own faults which we have analyzed.

## REFORMS OF 1920 AND THEIR CAUSES

THIS system of recruitment operated until 1920, when minor changes were made. Those changes were the first results of a rather widespread feeling that thorough reforms were necessary if the civil service were to acquire the qualities essential in the modern state. Since the creation of the Empire in 1871, Prussia's influence went far beyond its own boundaries; its indignant effect was over two thirds of the territory, and when we add that the choice of officials for the imperial departments was from the various states in some rough proportion to their importance, the significance of the Prussian method was great enough to rouse widespread interest and even anxiety. Then came World War I. The unfortunate are morbidly curious about the causes of their downfall. A flood of self-criticism was the result. The liberal Germans were determined as never before conscientiously to master the parts of their gigantic political machine.

The classic sign of this spirit in the context of administration was a short tract by the statesman and administrator, Clemens von Delbrück.<sup>13</sup> It was written a year before the end of the war.

*Law versus the Social Sciences.* Delbrück starts with the already familiar analysis of the political economic activity of the modern state. The nature of this activity imposes upon the administrator a task vastly different from the judicial function. The judge works within rigid norms and does not judge by the conse-

<sup>13</sup> *Die Ausbildung für den höheren Verwaltungsdienst in Preussen* (Jena, 1917).

quences of his judgment but by those norms. The administrator, on the other hand, has a wide field of discretion, and the consequences of his actions are of the essence of his decisions.<sup>14</sup>

He must, therefore, know what economic and political consequences his decisions will have for the individual and the community. He must arrange his measures that they benefit the public welfare and do not injure the individual without necessity. He must also be zealous to serve the individual, as far as he can, without injury to the community. In economic measures the administration is pre-eminently free in its resolutions and is bound to the law only in respect to their formal conditions and execution . . . Allegory was wont to show us Justice with bound eyes, and if we desired to pursue this figure, we should picture administration with eyes very wide open.<sup>15</sup>

The task is a particularly delicate one in a constitutional state, for the civil service must maintain an impartial attitude in a policy founded upon and directed by party conflict. It must serve the people and not antagonize Parliament, take political decisions but avoid political enmities. The impartial position of the civil service is emphasized in a study by another writer, who points especially to

<sup>14</sup> *Ibid.*, pp. 26-27.

<sup>15</sup> The antithesis has also been put thus: "The administration of justice and administration are inherently different. This is demonstrated already by the fact that the judge has a list to work through, that is, the cases laid before him, and he can only deal with these. Beyond this he has no initiative. The administrative official, who merely settles cases which are brought to him by the public, is a very bad official. His office demands more of him. He must take action independently, draw matters to himself, and often himself provide the most important part of his work. He must pursue the needs and the development of life and economic activity; he must preconceive the uniqueness of separate things by the aid of creative fantasy, and make decisions. For this purpose the law is not an end in itself but a means to an end. Law only affords him the possibilities and limits of his activity. With the judge it is otherwise, although I am strongly of the opinion that the creation of law is the business of a judge, yet as a rule, he will do no more than subsume cases under their respective paragraphs." Nostitz, *Verein für Sozialpolitik* (Kiel, 1920), pp. 140 ff.

the need for keeping the great economic and social groups, technique and capital, in social order. Such qualities as this implies cannot be bred by the study of law: only the social sciences can serve.<sup>16</sup> But this does not mean that the administrator is to be trained in the social sciences only; for law must have its place, though a subordinate place, in the total scheme.

*For How Many Years Shall Training Last?* Delbrück then turns to the question of the length of training. This question had troubled German opinion for years. Delbrück remarks that the German higher civil servant does not get the opportunity of independent work until he is about thirty. Not until he is about thirty-five does he, perhaps, become a *Landrat*: that is, an official with an appreciable scope of power and responsibility. This training is too long. Delbrück is, in this opinion, only one of many voices. The noted economist, Professor Schumacher of Berlin, speaks from his own experience (as Delbrück does) when he says: <sup>17</sup>

I am not sorry that I was once a referendar—I learnt an extraordinary amount during that time; but I must assert that I suffered very much under the oppressive feeling that I was entirely chained up just in the years when I most strongly felt the impulse to act. Since then, I consider it to be one of the worst faults of our general organization that we let a great part of the most valuable talent in its most important years of growth wear itself away with waiting in nonresponsible and, to some extent, insufficient work. [Here the Assembly cried: "You are right."] . . . It is fundamentally unsounded to take away from a young man until nearly thirty both economic responsibility for himself and material responsibility for his work.

This view is represented in other places also.<sup>18</sup>

<sup>16</sup> W. Brück, *Das Ausbildungsproblem des Beamten in Verwaltung und Wirtschaft* (Leipzig, 1926), pp. 14-15.

<sup>17</sup> Schumacher also humorously remarked that the thwarted desire for activity caused the production of a substitute: "that pretentious bearing toward others that has so often given offense." Cf. *Verhandlungen des Vereins für Sozialpolitik* (Kiel, 1920), p. 77.

<sup>18</sup> Brück, *op. cit.*, p. 34.

It is a valid and vital criticism of German recruiting methods. The British method has been strongly opposed to putting off the age of responsibility by a long period of preparation. The men who thus expressed their opinions about responsibility did not define it. They only felt its definition. But expressly to define it is to assert unequivocally why it cannot be put off to a late age, as well as why, too, an early age may equally be disastrous. Responsibility in office means freedom of judgment and action combined with unlimited liability to suffer the natural consequences of a mistake or enjoy the natural consequences of success. This implies in a person thrown into such a position some kind of spiritual balance between his own various faculties caused by his contact with the possibilities of pleasure or pain and with the objects or persons who form the material upon which his official judgment and activities are to be exercised. They will have an effect upon him, as he upon them. The result of the experience is to produce in the responsible person a knowledge of himself (it may be deep or superficial), of other people, and of inorganic environment. He will learn, in the uninfluenced measure of his capacity to learn, how much and how little man can do to secure a control over nature, and what personal contribution he is able to add. He will measure his own strength and weakness, and learn the worth of his own personality. And measuring this, he can measure that of others, and again, knowing others, he can again recoil upon himself and estimate his own place and value. No study yet invented offers so subtle and extensive a variation of happenings upon which to exercise judgment as human affairs themselves. For every object of study has its own nature, the way in which it is manageable, and the impression it produces upon the mind. The full effect of this is to be felt only by unhindered and unaided access to the objects themselves and the joys and sufferings emergent directly from them.

It is clear that the sheltered and cloistered life of book knowledge, with par-

ents paying your way, and a long preparatory service when you are neither civilian nor civil servant and when not a pittance is paid you and not a day passes without tutelage—that all this places a screen between the spirit of the novice and his own personality. There is no connection between what you eat and what you produce. You answer not to those who may suffer by your activity, but to some one who stands between, who cannot take you completely *au sérieux*. The tenets of the schools are not graven into the character by the power of immediate abrasive reality. That is, you are devoted to an academic prescription which is not really appropriate to your profession. And the longer this goes on, the more powerful do the inhibitions or the incitements uniquely created for and by this prescription isolate you from neighboring aspects of life, sometimes from life itself.

It is a moot point exactly where to draw the line. Freshness of mind is at times strangely akin to dangerous ignorance. Some academic and tutelary guidance is essential. It can obviously, however, be overdone. And this as much as the study of law made the German civil service pedantic, authoritarian, and unadaptable.

Von Delbrück was accordingly opposed to any lengthening of the university course. He suggested the abolition of the nine months of judicial service for the administrative officials. Nine months would be won for administrative preparatory service, and whatever of private and criminal law these officials needed they could learn at the university where, however, administrative law should be their chief legal study. The proper subordination of law to the other studies, but the combination of the two, would be useful not only for administrative officials, but also for all those who desired to serve in local government, journalism, or Parliament. Von Delbrück looked forward to a single faculty uniting political science with jurisprudence. The studies should be followed by the first university exam-

ination, a preliminary to the preparatory service.

*Theory and Practice.* The next topic is, like the question of age, a widely discussed one: what can be done to secure that, when the student enters the service, his judgment shall be less theoretical than it is after the ordinary university training? We have already adverted to this problem. One solution discussed but rejected by Delbrück, is the introduction of a practical year into the middle of the university course. (Delbrück states an alternative: one year's employment in a local authority before the student enters the university.) It is urged that the practical work would enliven the students: their elementary lectures would prepare them for this year, and their practical year would prepare them for their final and advanced lectures. (Delbrück rejects the intermediate year on the ground that it would increase the academic years to four: and the alternative suggestion on the ground of its impracticability.)

German teachers likened the student with an economic and law degree to a medical student who begins practice without clinical experience.<sup>19</sup> There is an extraordinary unanimity of opinion about the "world strangeness" (*Weltfremdheit*) of the German official. There is not the same unanimity of view about its remedy. A director of a private business insists<sup>20</sup> upon the necessity of practical study before an occupation can be undertaken, and says that no system whereby the student goes for short periods (weeks or months) into one business after another can give him the required intensity of experience, since an unbroken stretch of time is necessary for him to become really acquainted with the conditions of labor, and the working class, and social legislation, and taxation relating to industry. And a professor of law and economics<sup>21</sup> analyzes that which the student may expect to derive from a practical year: he would learn

the sheer difficulties of daily life, the realities with which he is not familiar without experience, especially if his family are professional people. He must participate in menial tasks, and somewhere be, for a period, a cog in the great machine, whether it is a handicraft, or industry, or agriculture—where, does not matter, it is enough that he participates somewhere—so long as he somewhere learns the nature of the frictional difficulties of real daily life and obtains a really deeper insight into the world of labor and for a time works shoulder to shoulder with the mass of working-men.

An administrative official of wide experience in the training of referendars in the preparatory service warmly recommended that the university course of study should be divided into two parts; one of elementary law and economics lasting two years; then two years of varied practice; followed by a final two years of study. For the administrative official was essentially a man of decision, yet the referendars who come under his charge were the least ready to take a decision.<sup>22</sup>

They believe that when they have once weighed up all sides of the subject, their work is at an end. I have been able to embarrass the referendars in theoretical and practical training by asking them, after they had most beautifully reported upon the legal and material circumstances of a case: "Now, what will you do? How will you solve the problem? To whom will you write? In what manner will you write? Is there anything more to be done? How will you begin operations?" They were nonplussed, and realized that the difficulty begins precisely at the point where they thought the subject was exhausted.

The only agreement indeed so far reached upon this vexed question was that something ought to be done to mitigate the ossifying effect of book knowledge and lectures. The most general solution offered was much greater use of seminar work, discussions, and practical exercises (papers, reports, and so on) by the students.

The discussion leads one back inevitably to purpose of training. Is it learning that is required, or a quality of mind, difficult to define, but which roughly is

<sup>19</sup> Professor Jastrow, *Verein für Sozialpolitik*, p. 21 ff.

<sup>20</sup> *Verein*, p. 82 ff.

<sup>21</sup> Professor Fuchs in *Verein*, p. 93.

<sup>22</sup> Dr. Saenger of Berlin, *ibid.*, p. 173 ff.

ability to learn, judge, and act? It is not knowledge, but manipulative, managing power, the recognition of the nature of the task, and the ability to devise and use the appropriate implement. This is the capital contradiction which must be fought out not to the victory of either side, but to that compromise which will produce the best civil servant. Of this, I believe Professor Schumacher had the clearest understanding and his words have the obvious stamp of the real.

The need of actual researchers is always extraordinarily limited; the need of men, on the other hand, who, without being learned, have acquired real scientific self-training, is in a civilized nation constant and growing if it is not to be stunted.<sup>23</sup>

In the schools the training must proceed upon the basis that everything supplies a problem to be solved. Science is an incessant struggle with problems. Schumacher continued:

Only in such a struggle which is always renewing perception, can clarity, the preliminary condition of everything else—and first of all clarity toward oneself—be won; that feeling for actual limitation which distinguishes expertness from dilettantism and is always and everywhere the proof and sign of true education . . . and self-understanding gives us the possibility justly to match together our own powers and our self-constructed aim, and upon this basis only does clear intelligence of the outer world develop; and there develops also the strength to overcome successfully the mightiness of error and delusion; the instinctive certainty of feeling, to which true competence which remains conscious of its limits, may finally unfold.

It is the mode of thought, the art and process of reasoning, that is to be sought; of course, as applied to the whole economic and social system. And this will give a judgment how to remove the unfavorable and enhance the favorable. It is impossible for even the most informed economist to know all that there is to be known about economic life—it is too vast.

*Changes between 1919 and 1933.* The

<sup>23</sup> *Ibid.*, pp. 77-78.

constitutional revolution of 1919 gave an opening for the introduction of changes in the recruitment of the higher civil service, and these changes were based upon the development of opinion since the coming into operation of the Act of 1906. The main changes were indeed accepted in the Prussian Diet with hardly a dissentient voice.<sup>24</sup> The Act of 1920<sup>25</sup> amended that of 1906; it left the basic lines of that act fundamentally undisturbed, but modified them in respects calculated to energize the service in the future. The preparatory service was reduced from four to three years. The preparatory service began with judicial service of only six months. An alteration as significant as these was produced by the reform of the law examination which all law and administrative students had to take as a preliminary to the judicial and administrative services.<sup>26</sup> The immediate result was the regulation of the first legal examination. In the written examination about one quarter of the time was definitely assigned to constitutional and administrative law, and in the oral, which lasted two days, one day almost entirely to economics and political science.

The judicial term was served as before in a small court of first instance (the *Amtsgericht*). The preparatory service of two and a half years was spent in much the same way as before, with shorter stages. Finally, the appointment of certain officials to be the mentors of the referendars (which began in 1906 and proved itself a successful arrangement) followed by an extension of their activities. They were given special leave to attend the lectures of the Institute for Further Education in Political Science, and they met together at this Institute for discussion of their problems.

## SURVEY OF GERMAN EXPERIENCE TO HITLER

### SURVEY OF GERMAN EXPERIENCE TO HITLER

(1) At the beginning of the nineteenth century there was a change in the training of civil servants: from the group of economic sciences collectively called Cameralism the weight was put on the study of law. This gave satisfaction for a time, because the state modified its previous positive activity and served by policing and emancipating.

(2) Environment and ideas changed under the influence of the industrial and commercial revolution, and the study of law as a training ground for administration was found wanting.

(3) In place of law what may be called neocameralist studies—that is, the social sciences—assumed the predominance in opinion, and the legislation of the twentieth century has accorded them an important place in practice. It is agreed, too, that the social sciences should include some law, mainly public law, but there should also be attention to the elements of private law.

(4) A period of preparatory service was always a part of the training: its value is definitely established by experience. It is applauded by everybody concerned. When differences arise they are upon the question of whether any time, and how much, should be spent in private industry. Practice with the local authorities and the local self-governing authorities is of capital importance in the modern state, which cannot dispense with local government, and where proper cooperation between the center and the locality may make all the difference between good and bad government—in terms of the satisfaction of the people and the economy of means.

(5) It was found that university training may easily result in administrative sterility. The safeguards against this are vital teachers and methods which impress the students with the practical importance of their work and inspire them to cooperate with their teachers in the mastery of a task and the solving of a problem. This first: then come adjuncts to book study, like occasional visits and practice.

(6) It is desirable in the highest degree to set administrators to work, on their own responsibility, at the earliest possible age. For the best training for life is life itself. The German method was criticized as devoting too long a time to preparation.

(7) The discussion of the place of law in the training of civil servants has produced a secondary discussion: the place of economics and political science in the training of lawyers and judges. The result, in theory and practice, was important, since no one qualified as a lawyer for the first rungs of the ladder to the bench without some university training in these subjects.

(8) Germany has had an extremely long and continuous history of interest in administrative efficiency. The interest is an illustration of her political character, and her psychology in politics could be written by deduction from this as a major premise.

(9) The actual selection of those who had qualified themselves in the prescribed way resulted in "closed" competition, keeping out republicans, socialists, atheists, those from poor families, the liberal-minded, and unorthodox in a monarchical and authoritarian state.

(10) German officials, carefully selected from restricted social classes and political outlooks, served a peculiar state in a peculiar way. They took orders from a monarchy that was not responsible to the people, and day after day administered in opposition to a *Reichstag* which could nag but not command them, because it was not the sovereign representative of the people, whose political parties, having the hypercritical temerity of the impotent, carped at and alienated them. They were instruments of a highly centralized state whose tradition of authoritarian government, benevolent or not, had shown no break in selfconfidence and paternalism for three centuries. They were devotees of a polity which had risen, flourished by military success, and exulted in kneeling on men and women abjectly obedient, even servile. They always looked upwards for orders: and

## RECRUITMENT IN GERMANY

what they received in sternness they passed on in undemocratic rigor. They were friends of the people on their own terms only.

### THE NAZI RÉGIME AND THE CIVIL SERVICE

THE creation of a civil service imbued with duty and a "sense of state" was a valuable legacy to the Weimar Republic had it known how to purge its inimical elements. It was a heaven-sent boon to Hitler's government, because the nazi movement had an uncanny and ruthless ability to subdue and exploit other people's noblest loyalties.

The higher civil service inherited by the Weimar coalition governments was on the whole monarchical and authoritarian-minded, and saturated with a stronger or fainter contempt for the democratic or party-state, though there were exceptions.

As the civil service had its "well-acquired" rights to place and pension, which it received in return for its life of selfless devotion to the service of the state, and especially the right not to be demoted even if transferred, and as there were not many places of equal rank to which a man might be transferred, the Republican governments did little to rid themselves of cryptoenemies. Nor were they impelled to by their political beliefs, for these included tolerance and fairness to individuals. Furthermore, within a very few years, the Weimar parties were no longer in a majority, and could not do as they liked, without raising a great parliamentary storm. When a "Rightist" attempt at a *coup d'état* was made in 1920, the high civil servants, indeed, sided with the Republican government, and lent all aid to defeat that attack. When von Papen in 1932 attacked the government of Prussia, once again many officials, but now not so many as before, defended the Prussian government. Yet the dominant tendency was nationalistic, authoritarian (though not arbitrary), and legalistic.

For Hitler this was an ideal foundation. In the first place, most of the high

officials (and the middle and lower ranks for that matter) were ready to serve him because he had been appointed by the President of the *Reich* in accordance with the letter of the constitution. Secondly, they obeyed commands because the execution of Hitler's laws and decrees was constitutionally based on the Enabling Act of March 24, 1933. Thirdly, the nazi movement was expert in taking measures to bend to their will the personnel of government. It did this in the following way.

A series of laws on the civil service beginning with the Law for the Restoration of the Professional Civil Service, April 7, 1933, swept away the "well-acquired" rights mentioned above. It gave to the government the right to purge the service of persons of non-Aryan descent, and others "who because of their previous political activity do not offer the assurance that they will exert themselves for the national state without reservations." More laws and decrees filled out this statute.

Some civil servants fled for their consciences and their lives. Others stayed because they felt conscientiously that they might temper a terrible régime by their counsel, their fairness, and their moderation. Other officials had had no connections at all with politics, and still continued in their nonpolitical work of economic, or social, or statistical, or tax administration, and so forth, in which, as it were, the Nazis were "neutral." Furthermore, the important posts, or new posts, in police administration, especially the secret police, and in the organization of suppression, went entirely into the hands of Nazi fanatics.

For the rest, the Nazis contented themselves with a moderate purge. Those who were allowed to remain, or wanted to remain, were subordinated to the Nazi political chief, or party supervisors, or Nazi appointees. Thus, Professor Brecht observes that of 1663 Prussian members of the higher civil service in field positions, 28 per cent were either dismissed as "unreliable," Jewish, or the like (12.5 per cent), or dismissed or demoted to lower

positions for "administrative reasons" (15.5 per cent). In the middle brackets of the civil service, including especially the clerical class, only 3.46 per cent were so affected.

The top personnel close to the political chiefs in charge of policy, propaganda, foreign affairs, and the control of the local administration were drastically purged and replaced.

Next, to make sure of the new appointees, and the survivors, new Nazi law subordinated all civil servants to the *Führer* and the party. Whereas they had hitherto taken an oath to protect the constitution, they now took this oath: "I swear that I shall be faithful and obedient to Adolf Hitler, the leader of the German *Reich* and the people, that I shall obey the laws and fulfill my official duties conscientiously, so help me God" (Law Regarding Public Officials, January 26, 1937). This law imposed a number of detailed duties on public servants. It was a code of discipline, and subjected them to the power residing in the *Führer*-ship and cabinet. For nearly one hundred years the German civil service had been governed in its official duties and demeanor, as well as in its behavior outside the office, by a comprehensive and exacting code of duties. This was turned to Nazi use. And now the service reverted to the three-centuries-old practice of secret reports on subordinates, which had struck such terror in them, and aroused so much hatred, and had been abolished by the constitution of 1919. In the law of October 20, 1936, preferential treatment was prescribed for entrants who were party members, and those who deserved especially well of the party. In these cases apprenticeship could be waived altogether or reduced in term. Promotions in office were made dependent on unconditional support of the Nazi movement. The Law of July 10, 1937, drew into the *Führer's* hands personally the appointment and even the retirement of all important officials. The Civil Service Code of 1937 required the deputy party leader and the local *Gauleiter* to certify the political reliability of entrants.

A campaign to secure their membership in the party was conducted, and the Foreign Office officials joined as a body. (They thus avoided victimization of those in the office who were not Nazis.) The campaign was not fully successful, and perhaps also the Nazi movement was not anxious to have a mass following, for by 1939 only a little over 28 per cent of the 1,500,000 members of the Civil Service were members of the Nazi party. Yet, 28 per cent is an ample figure. Not until somewhat later was party membership decreed obligatory for entrants to the public service.

Under the Weimar government, the civil-service trade unions, or associations, were guaranteed their free right to exist, though later denied the right to strike. But they were free to flourish and carry on the work of improving the professional situation of their members and their friendly services. They were, indeed, a model of professional propriety and helpfulness. The Nazi government brusquely changed this. All civil service associations were put under the wing of the Nazi party as one of its ancillary and supporting organizations. Its chiefs were Nazis and its objectives perverted into instruments of Nazi policy and philosophy.

In spite of these internal and external measures, penalization, and blandishments, the German civil service remained an extraordinary blend of loyalties, by no means nazified, though serving the Nazi state.

*The Review of the Foreign Press* published by the British government during World War II contains numerous instances of the fulminations of the Nazi hierarchy against the permanent civil service, especially the old-line officials, for their unbending will.<sup>27</sup> The shortage of manpower made it necessary to restore to their offices some of those who had

<sup>27</sup> Cf. also the joint statement of United States Ambassador George Messersmith and R. H. Geist, Counsellor of Embassy, in *Nazi Conspiracy and Aggression*, Vol. V, p. 39 ff., for a discriminating account of official responsibility.

## RECRUITMENT IN GERMANY

been retired, and there was much anxiety whether a proper balance was being maintained between good Nazis sent into the field and others who remained in the civil service. Hitler finally burst out in the *Reichstag* on April 26, 1942, against the civil service, and that body unanimously sanctioned the rights he claimed as "*Führer* of the Nation, Supreme Commander of the Armed Forces, Chief of the Government and Supreme Executive Power, as Supreme Justice and the *Führer*

of the Party" . . . without being subject to existing legal provisions of obliging every German national to do his duty by whatever means he deemed appropriate without instituting any procedure otherwise prescribed!

It is clear that the denazifying of the German civil service needs the most discriminating care, and that a new spirit and new procedure of selection is required for the German government of the future.

## *Recruitment of the Higher Officials in France: Nineteenth and Twentieth Centuries*

It was not until late in the nineteenth century that France was able to overcome the twofold inheritance of the *ancien régime* and the Revolution: favoritism and centralization. Favoritism, though not necessarily incompetence, was stamped on the French administrative system by the Revolution and Napoleon. The first had swept away venality, but in its place no public standards of competence had been created.<sup>1</sup> The factions had their own special tests of efficiency, the first of which was—in the center—loyalty to their principles, and—in the localities—elections carried on under conditions in which the elected officers could not act for fear of the displeasure of the local cliques and for lack of a properly ordered system and public force to support them.

### NAPOLEON: THE MIRACLE OF THE REAL PRESENCE

Under Napoleon, a more settled and rational scheme of appointment was applied, because his rule was longer than that of the different revolutionary sects and his social schemes were more fully elaborated and applied. Nor, except as a joke and a means to personal power,

would he accept the ingenious paper schemes of the quaint Siéyès in which one of the consuls, the consul de la Paix, would nominate to all offices in the ministries of Justice, Interior, Police, Finances, and the Treasury, while the other nominated all those in the Ministries of Marine, War, and Foreign Affairs. Siéyès, said Napoleon, had put only shadows everywhere, the shadow of judicial power, the shadow of government. Substance was somewhere necessary, and he put it in the executive power.<sup>2</sup>

But since the whole social scheme was politically dependent upon Napoleon's personality, he could not abdicate the choice of the principal officials, nor, since his nature obliged him to make of France a vast barracks, could he avoid naming the civil generals of his host. And the hierarchal quality of his system must be more extreme than the extreme anarchy of the preceding decade. His very genius postponed the time when a system of impartial choice could be established to operate continuously and automatically according to the principles of its foundation. All revolved around the genius and personal destiny of this man. The spirit which moved him to conquer in battle, and to undertake battles at all, moved him to be grimly exigent of success in the civil field. What did it profit

<sup>1</sup> Cf. H. A. Taine, *Les Origines de la France Contemporaine, Régime Moderne* (Paris, 1882-91), Vol. II, p. 146; and cf. sections on "L'Anarchie, La Conquête Jacobine" and "Le Gouvernement Révolutionnaire" for details.

<sup>2</sup> *Ibid.*, p. 170.

to win a campaign and lose the rulership of his adopted country? He could not boast legitimacy as a title, but only performance. Therefore he recognized no airs and graces, no artificial distinctions or honorific titles, as a claim to office; he did not even exclude the capable *émigrés* who had returned, many at his bidding, but, side by side, he indiscriminately employed the able, whether they had formerly lived by royalty or risen by killing it. The talents were required. The success of his state depended upon a variety of factors which were all present. He knew exactly what end he wished to achieve—perhaps not in the very large, but at each successive stage of his evolution. This knowledge automatically prescribed the type of men he required; for his comprehension of the science and technique of civilization was encyclopedic, and his administrative talents so unprecedentedly marvelous, that to conceive the end was at the same time accurately to conceive the means. But to have stopped at the recognition of what type of men was needed would have been insufficient. Napoleon required and possessed the faculty of judging men, of knowing with little effort how much was actually promised by external indications, and then he was ruthless in stripping the establishment of incompetents. He, therefore, with few exceptions, personally appointed, promoted, relegated or dismissed the higher administrative officials, especially the *Conseil d'État*:<sup>3</sup>

A minister would not have dismissed a single official without the counsel of the Emperor, and all the ministers could change without two secondary changes in the whole Empire resulting. A Minister did not appoint even a clerk of the second order, without presenting to the Emperor a number of candidates and with them the names of the people who had recommended them.

We must not, of course, drive too far the notion which supposes that the Emperor had the time or knowledge for effective selection of all the thousands of

officials who now spread not over France only but far beyond its borders. But we may take it that all the officials from the highest down to what we should nowadays in England call the executive class were directly selected by Napoleon. It is said that he formed a group of some five or six hundred young men, whom he successively called to the highest functions, in order to keep out those old enough to have been influenced by the old régime. Chaptal says (but exaggerates):<sup>4</sup>

He needed valets, and not councilors, so that he arrived at completely isolating himself. The Ministers were nought but chiefs of the bureaux . . . He administered down to the smallest details. All who surrounded him were timid and passive. One studied the will of the oracle and executed it without reflection.

There were not lacking the incentives to good work. There was ever the knowledge that the marshal's baton lay in the drummer boy's knapsack. And all knew the violence of the Emperor's anger with incompetents, which extended to contemptuous dismissal accompanied literally by a kick! As in the army, the worship of talent was conducted of set purpose—loudly, publicly, ceremonially—and to pay and power was added social distinction. The Legion of Honor was now established. "The French," said Napoleon, "have only one sentiment, *honor*; we must nourish that sentiment, they need distinctions." Titles of nobility were restored just when the American constitution banished them. Political privileges were established, like the right to be elected in the *département* and the *arrondissement*. The children of those thus distinguished received scholarships to enter *lycées* and the great military schools.<sup>5</sup>

Then there was the fury of his own fierce energy. He watched by day and night, and in his prime he worked at an electric pitch of intensity, for eighteen hours a day. In six hours the year's

<sup>4</sup> Cf. Comte de Chaptal, *Mes Souvenirs sur Napoléon* (Paris, 1893), p. 228. Chaptal was Minister of the Interior under Napoleon.

<sup>5</sup> This is occurring in the Soviet Union, it commenced at the beginning of World War II!

<sup>3</sup> Cited *ibid.*, p. 168.

records of a prefect were examined, analyzed, the balance of efficiency struck, a scolding or reward administered, and reforms elaborated. One official said:<sup>6</sup>

I worked from morning until night with a singular ardor; I astonished the natives thereby, who did not know that the Emperor exercised upon his servants, however far away they were from him, the miracle of the real presence; I believed I saw him in front of me, when I was at work shut in my study.

That, indeed, was the culmination of the Napoleonic system, and the sole condition of success of this mode of appointment and promotion—the miracle of the real presence.<sup>7</sup>

In a previous chapter we referred to a treatise upon public administration dating from this time. Bonnin's analysis of the qualities of an administrator are the qualities sought by the Emperor, and essential to the Emperor's system.<sup>8</sup>

<sup>6</sup> Cf. J. C. Beugnot, *Mémoires* (Paris, 1896), Vol. II, p. 372. Cf. also for many interesting passages on Napoleon's qualities as administrator, *Memoirs of M. de Bourienne*, edited by D. Lacroix (Paris, 1829); Bourienne was Napoleon's private secretary for some years.

<sup>7</sup> Comparison may be made with Frederick the Great: Macaulay's essay is very intelligent in this regard.

<sup>8</sup> Cf. C. J. Bonnin, *Principes d'Administration Publique*, 3rd edition (Paris, 1812), Vol. I, Introduction. (I am glad to think that my researches in France enabled me to bring this work to the attention of the English-speaking world.) E.g., p. 152 ff.: "All officials in the administrative system are and ought to be nominated by the prince, because they are his direct agents for the execution of the laws and the management of public affairs, and because, being the guarantor of such management, selection ought to be abandoned by him. Otherwise, it would be to will the effects without willing the necessary causes, because the causes would not produce the effects. Further, these officials participate, by the nature of their functions, in the Government of the State, since without them the prince could not act. To act it is necessary for him to have in his power the means of action, and these means depend upon his choice, without which his moral responsibility would be null, his action paralyzed, because he would no longer have at his disposition the knowledge of men, place and time." So also in regard to promotion, dismissal, etc.

#### FROM NAPOLEON TO THE THIRD REPUBLIC

THE fall of Napoleon took the pith out of his system, and his definitely conscious and energizing will gave way to a tawdry mock constitutionalism in which a king, Church, and the Chambers strove for mastery, and within these bodies there were violent intestine quarrels. Recruitment, let us say, in 1812 had been based upon a principle of Napoleonic efficiency, and this principle had been far in advance of anything at that time pertaining in England. In an incredibly short time the spirit faded and it was replaced by almost precisely those administrative manners which had their apogee in England under George III. But in France the consequences were worse, for their patronage extended to the prefects, sub-prefects, and mayors of all the localities. The evil penetrated all the members of the state. For each entity which strove for power—the cliques around the throne, the husbands of beautiful women, returned *émigrés* conscious of their family's services to the ancient royalty, clerical and anticlerical, ministers and deputies, republicans, Napoleonists, the Center, the Right, and all the other varieties of parliamentary groups, old noblesse and new noblesse, upper-middle class of former creation or recent acquisition of wealth—each was covetous of jobs for itself, for its friends, for its supporters, as present rewards or promises for the future.

The genius of Balzac<sup>9</sup> has left for us a picture of those times; and he shows us in the matter of a single career that capacity, industry, and public spirit succumbed to incapacity, inertia and selfishness. Occult influence decided appointments and promotions among the thirty thousand officials, and this influence had nothing at all to do with ability to carry out administrative tasks. The results were lack of subordination, since the power and status of the superior were never upon a steadfast foundation; lack of incentive, since dismissal and promotion could result from adventitious causes; and

<sup>9</sup> In *Les Employés*, dated July, 1836.

the swelling of the numbers because jobs were a currency which all sought. Gixion, Balzac's hero, says:

Serving the state today is not like serving the prince, who knows when to punish and when to reward. Today, the state is every one. Now, everybody is not concerned in anybody. To serve every one is to serve no one. No one is interested in any one. A clerk lives between two negations. The world has no pity, has no respect, has no heart, no brains: it is an egotist, it forgets tomorrow the services rendered to it yesterday. In vain can you search within yourselves to find . . . that from the tenderest infancy you had a talent for administration, that you are a Chateaubriand as regards reports, a Bossuet as regards circulars, a Canalis as regards memorials, or the genius of dispatches. There is a law of fatality against administrative genius; the law of promotion which results from it. This fatal method is based upon the statistics of promotion and the statistics of mortality combined.

*Attempts at Reform.* From the time of Napoleon to the Third Republic, France lived, with occasional but reprehensible lapses, under a bureaucracy thus composed. And in that time, although there were reformers pertinacious enough to cause discussion of reform legislation, there was never a majority in favor of reform. Even when there were majorities in favor of the major premises—"All offices should be filled only by the capable"—and successive majorities for secondary premises and the detailed conclusions which followed, by the time the Chambers arrived at voting upon the entire syllogism and its legislative embodiment, the majority had mysteriously disappeared. It is a brave class or clique that will disown itself, and the evils which Balzac portrayed are described again and again in the periodical *rapports* made by parliamentary commissions well down into the Third Republic. There were many legislative attempts at reform,<sup>10</sup> but though they were made by the best parliamentary leaders, perhaps because

they were made by those who stood above the common level they failed, with the result that the French civil service was by the 1930's regulated by a number of uncoordinated statutory clauses, a vast number of decrees made by successive governments, and the jurisprudence of the *Conseil d'État*.

All attempts at making a general *statut* were defeated. Why? It is clear from the parliamentary proceedings and maneuvers concerned with each attempt that only in recent years has the administrative efficiency of the service come to rank even as important as other factors in government and society. In the decades between the return of the Bourbons and the Third Republic the desire to limit the arbitrariness of government was uppermost in the minds of the opposition, while those in authority insisted upon the need for free discretion. Until recent years, indeed, the whole régime was in peril: hence the power to control the service was fought for on both sides as the power to appoint only the friends of the régime. This caused undue emphasis upon the sovereign power of the government, whether royal or republican, to make appointments as it wished. Hence, even Parliament accepted the view that the terms of recruitment should be settled by royal *ordonnance* or *règles d'administration publique*. This placed the burden of care for efficient administration upon the ministers: they could not bear the burden, and they abused their power. Further there was never a coincidence of the attitudes of the government, the Chambers, and the civil service. Each took a different course according to its own particular exigencies, and these never coincided: hence, although many projects were introduced and pressed they always failed. Moreover, in the Third Republic, even when it was well established, no government was sufficiently agreed upon a project, nor was there a cabinet majority to support it in the Chambers for a time sufficient to secure the passage of a law: there were government projects and the counterprojects of the Chamber and its commissions, and though the

<sup>10</sup> They are best reviewed in A. Lefas, *L'État et les Fonctionnaires* (Paris, 1913); this includes the Briand-Maginot project of 1911. I have verified Lefas' account by examining the various *rapports* he quotes.

## THE CIVIL SERVICE IN THE THIRD REPUBLIC

differences between them were sometimes small, they were large enough to cause the downfall of the measures because the government was too preoccupied, too unstable, and too short-lived to carry anything through.

The civil service statute is the will-o'-the-wisp of French politics. The ultimate question is why there was not such agreement upon their matter that a measure was possible. The ultimate answer is that French politicians were interested in other things than efficient administration: and the existence of jobs was exceedingly demoralizing. The result was to cause pressure for arrangements more extreme than elsewhere: for syndicalism, and councils of administration instead of a minister in each department, to act as the employing and disciplinary authority. However, the claims of efficiency had to be met, foreign experience, the example of private industry, and the manifest need of administration were the impulses, and the French pursued a path peculiarly their own.

*The First School of Administration.* Even as far back as 1843 Laboulaye had suggested the idea of a special school of administration, from which the high officials of the departments would be supplied. And prior to that, Salvandy, Minister of Education from 1837 to 1839 and later from 1845 to 1848, had seen that a large part of the problem was to reform the faculties of law at the universities, for the men who entered the higher administration came overwhelmingly from the study of law. He wished either to organize a section of political science in these faculties, or to create a special school for the public services. The faculties of law and even the whole university defeated the propositions out of monopolistic jealousy and want of imagination and public spirit, and remained, indeed, obstacles in the path of reform down to the resurgence of France in 1945. And their law teaching was the driest and least human and intelligent that can be imagined: it verged on the caricatures of legal education.

In 1848, under the impulse of another

Minister of Education, Hippolyte Carnot, a school of administration was established, by decree. It attempted to imitate in the administrative province what the Polytechnique did for the engineers, and what the military administrators and technicians did for the armed forces. It was to be a school "destined for the recruitment of various branches of the administration hitherto lacking in schools of preparation." But attempts to give the school a solid foundation by statute and parliamentary consent failed. The school lasted only eighteen months, admitting candidates between the ages of eighteen and twenty-two. They were to have three years of study, followed by a leaving examination. According to their position on the list, they would have passed into the various departments, including the prefectural and overseas administration, with two years of probation. The school came to an end because funds were not forthcoming; because famous statesmen started courses but had no time to finish them; because no steady policy for continuous work had been provided for. It seems also that hostility was incurred by the faulty policy of wishing to make all higher administrative posts at one stroke the preserve of the school. Finally, the faculties of law were bitterly opposed to this rival; and the various departments were anxious to retain their full power over the recruitment of their special, departmental personnel.

### THE CIVIL SERVICE IN THE THIRD REPUBLIC

NOTHING is more constant in French parliamentary reports than the view that it is impossible to regulate all departments of the government on the same principles, as in early years and substantially today in England. This was, in part, an attempt at obstructing reform, for if uniform rules could not be found they could not be applied, while different rules for each set of officials made the business so complex that either it was left to the individual minister's discretion or was left unregulated, and, indeed, there were the usual obstructive arguments

about the impossibility of testing aspirant officials by examinations. In part, however, it was the almost unconscious acceptance of the principle that previous training, competition, and recruitment should be special to each kind of situation. The English general examination was not accepted: the organized German systematic law training was rejected and the German preparatory stages not thought of. Even as the technical schools produced engineers for the road service, so could various special schools produce the administrators for the various other services of government.

*Principles of Recruitment and Training.* French law and practice to World War II were therefore based upon two main principles: (1) the service open to the talents<sup>11</sup> and (2) the talents trained by a special education and selected by special tests for each department, the nature of the training and tests being decided by a rule of public administration<sup>12</sup> for each department.

*The Principles in Practice.* (1) The law excluded the refusal of an office to a citizen on grounds other than his "capacity, virtues, and talents," but there was a certain means of escape for the appointing authority in the jurisprudence of the *Conseil d'État*, which said that public manifestations of certain political, philosophic, or religious opinions might be grounds for exclusion, for such opinions might show that the person was incapable of fulfilling the particular office he sought.<sup>13</sup>

<sup>11</sup> Constitution, 1791, article 6; 1793, article 5. The latest form is in November, 1848, article 10: "All citizens are equally admissible to all public offices, without any other motive of preference than their merit and following the conditions which shall be fixed by the laws . . ."

<sup>12</sup> The rule of public administration cannot be made without previous consultation of the *Conseil d'État*, which cannot veto the rule but may comment upon it. The simple executive rules are made without submission to the *Conseil*.

<sup>13</sup> Cf. G. Jèze, *Revue du Droit Public* (Paris, 1912), p. 453 *et seq.*, on the *Bouteyre* case and its implications; and cf. Léon Duguit, *Traité*, Vol. III, p. 199 ff., who denies this limiting power.

(2) The power to determine the rules of recruitment lay with the Chambers, with the President (where Parliament had not made a law on the subject), and with ministers to whom the President delegated the appointing power and who had the power to regulate in detail the power given them by law or Presidential decree.<sup>14</sup> Most of the rules relating to recruitment, promotion, and organization of the departments are made on the basis of the laws of December 30, 1882 (Article 16) and April 30, 1900 (Article 35), which provide that the central offices of each ministry will be regulated by a decree in the form of rules of public administration inserted in the *Journal Officiel*, and no amendment can be made except in the same form and with the same publicity.

The conditions of recruitment of the officials corresponding to the British administrative class and the German higher civil service were settled by a number of rules of public administration: e.g., diplomatic and consular service, Ministry of the Interior, Ministry for the Colonies, Ministry of Labour, and others.

The chief characteristic of these decrees were: (a) the fact that almost all central officials were regulated by them; (b) the universal prevalence of competitive examination, in the main entirely open; (c) for the administrative grade (*rédacteur*), competition by examination and oral examination; (d) the technical character of the examinations; (e) the demand for previous proof of successful education: that is, advanced high-school diplomas; (f) the wide age limits for entry into the service; (g) the departmentalization of the test.

Let us illustrate this practice—for *Rédacteur* (Ministry of the Interior). For this position, the equivalent of a subordinate in the administrative grade of the British civil service, the following were authorized to take part in the competitive examination: members of the executive grade who had had at least two years in the service, past students of the

<sup>14</sup> For the legal details cf. Jèze, *op. cit.*, Vol. II, p. 450 ff.

## THE CIVIL SERVICE IN THE THIRD REPUBLIC

École Normale Supérieure, or men with a *licence en droit, lettres, or sciences*, doctorate of medicine, or diploma of the *École libre des Sciences Politiques*, a diploma of the *École des Chartes* of the High School of Commerce, etc., etc. This requirement is to guarantee a certain level of education. The candidate must be under thirty (other departments: between twenty-one and twenty-eight, up to twenty-six, etc.). In this case, candidates had to receive the minister's permission to enter the examination; in other cases, entry for the examination was automatic after only conditions of nationality, army service, and medical examination had been fulfilled. The examination consisted of two written tests, and oral tests. The written tests comprised the making of a report, description, or comment on any of the general topics of a short list, and on any of a number of special topics. These all fell within the field of interest of the Ministry of the Interior or were cognate to it. There was no test in general knowledge, no general essay, no test of the mother tongue as in the English system, though this last was hardly needed at so late a stage considering the excellence of French secondary education and the national pride in literary grace.

The oral test did not consist as in England of a quarter hour of desultory conversation ending with the belief that the board of interview knows the man's character, but in oral tests upon the subjects contained in the list of examination subjects. Further, the candidate was given a set of minutes to study for a quarter of an hour and was asked then to dictate a letter on the subject for five minutes to a typist. For each part of the examination marks were awarded from 0 to 20. Then they were weighted thus: general question multiplied by 5; special question by 5; oral question by 3; dictation by 1. The examining commission consisted of the secretary-general of the department, or the personnel director (president); a director of the department; three principals; and one assistant (as secretary).

This body set the examination and rated the candidates.

We need not enter into the question of admission to the examinations—whether by previous interview as in the Ministry for Foreign Affairs, or by the various types of diplomas as in other departments. But let us notice that in the former, the written examinations (for the diplomatic and consular service) were on diplomatic history, economic geography, and public international law. For the *Conseil d'État* were required constitutional, political, and judicial organization, law in its many branches, and economics. For the *Inspection Générale de Finance*, the emphasis was upon mathematics, public finance (law and administration), and economics; similarly in the Ministry of Finances. In all of the services the oral examination was based upon the subject matter of the written examination. In the examinations for the Ministry of Agriculture, emphasis was placed upon rural economy and the law relating to agricultural credit, cooperative societies, public instruction regarding agriculture, etc.<sup>15</sup>

Once accepted into the service by this means, the *redacteur* moved by regular stages to the top of this class, and might by promotion reach the supreme positions of *souschefs* and *chefs de bureau*. It will be noticed that nothing like the Permanent Secretary at the top of the pyramid of a whole department has been mentioned as the acme of the career: this was a grave shortcoming of French administration.

Very little more can be said about the upper branches of French administration since statistics are not available; indeed, only since World War II has an organization been set up which may collect them. There was favoritism, but more in promotions than in recruitment.

*Appraisal of the Civil Service Under The Third Republic.* The contrast with

<sup>15</sup> Cf. for details the various decrees; some were given as a supplement to the calendar of the *École Libre des Sciences Politiques*, Rue Saint-Guillaume, Paris; cf. also Jean Bourdeaux, *Les Carrières Administratives* (Paris, no date, before 1930).

England and Prussia is remarkable: for these countries have a unified examination system, nontechnical in nature, and conducted by a body outside and independent of the departments. There were some good potentialities in the French method: for (1) it drew the candidate *ab initio* to the department in which he wanted to serve; (2) it required always a study of the economic and social background of modern state activities; (3) it brought the members of the department (as examiners) face to face with the candidates into their hierarchy, with the possibility of a better choice from the standpoint of public efficiency and smooth cooperation in the service. There were also disadvantageous potentialities: (1) the personal contact of heads of departments with candidates might very well result in favoritism; (2) the special knowledge might be narrow and superficially acquired.

Criticism of the examination methods hardly existed before World War II: the French were happy enough to have escaped from pure "spoils." But one great scholar, at least, preferred the English system because he believed it produced men who could think as distinct from those who merely mastered a special field of knowledge:<sup>16</sup> "a varnish which cracks and scales off at the first contact." Jèze believed that a general education would be enough, since most servants would never attain to really high rank until very late in life, if at all: why then require technical knowledge at entrance?<sup>17</sup> He believed that there should be a general culture examination at entrance, then, for promotion, technical examinations at successive stages. But this raises the more serious question of whether examinations at a later age are a just method of finding capacity. With all respect to Jèze, I am afraid that he was misled by

Lowell (whom he followed), for he dealt only with the examination and the subjects of the examination as determinative of culture. But the vital question really is the nature of university teaching, and I venture to say that this may, according to its character, give a general culture with very technical subjects and certainly with constitutional and administrative law and economics and political science, or an ossified pedantry to the most liberal subjects of education. Jèze and others also criticized the too great range of the syllabus.<sup>18</sup>

As regards the examining bodies, Jèze believed their composition to be conducive to co-optation and favoritism, and suggested the addition of independent experts from outside the departments.<sup>19</sup>

Lefas deprecated an attitude of hypercriticism regarding favoritism in official appointments,<sup>20</sup> and on the whole our own investigations bear this out. There were rules, rules of considerable merit, and the law and the administrative courts provided amply against gross abuses.<sup>21</sup> Even the old loophole (not unparalleled at one time in England) of entry through private secretaryship to the minister, was largely blocked: up till 1911 members of

<sup>16</sup> Cf. P. Dubois-Richard, *L'Organisation Technique de l'État* (Paris, 1930), p. 264 ff.: "A young man who wishes to succeed at the *Polytechnique*, after having passed the *baccalauréat*, is obliged to pass every day in his infancy and youth so many hours at his desk that he cannot find time to form his person and personality. Culture loses in depth, and even more in harmony, what it usefully gains in extent."

<sup>19</sup> H. Chardon (*Le Pouvoir Administratif* (Paris, 1912) believed that examinations wider than a single department and not intermittent (which separate departmental examinations can hardly avoid being) would raise the level of candidates, and render easier the assimilation of departmental grades.

<sup>20</sup> Cf. L. D. White, editor, *Civil Service in the Modern State* (Chicago, 1930), article by Lefas, p. 266 ff. Cf. also T. L. Barnier, *Au Service de la Chose Publique* (Paris, 1926). "In most of the public services, competition is today the basis of recruitment and free selection by the minister, by the prefects and even the majors, has been singularly reduced." Cf. also W. R. Sharp, *The French Civil Service* (New York, 1931).

<sup>21</sup> Cf. Jèze, *op. cit.*, Vol. II, p. 473 ff.

<sup>16</sup> Jèze, *op. cit.*, p. 466 ff.

<sup>17</sup> *Loc. cit.*: "Given the age of the candidates at time of entrance, the extent of the syllabus for the competition does not often imply even a good culture. The candidates have very superficial knowledge, a varnish which cracks and scales off at the first contact. We ought to renounce encyclopaedic programmes."

the cabinet of the minister were legally unregulated except by certain contradictory decisions of the courts: in 1911 a law provided that any appointments to public office from the ministerial cabinet or undersecretaries must be notified in the *Journal Officiel* before the resignation of the countersigning minister or undersecretary. Nor were ordinary civil servants who were appointed to a ministerial cabinet treated other than as the normal rules provide in regard to promotion. Yet this only requires publicity for an appointment made, it does not rule out or limit such appointments. Now, the decrees to which we have so far referred concerned only entrance into the administrative grade; they say nothing about the higher stages—*chefs de bureaux* and *directeurs*, the nearest equivalents of the English assistant secretaries to the Permanent Secretary. These are usually filled by promotion from those in the department and after many years of conspicuous service. But some were appointed from the ministerial cabinets. However, too much weight ought not to be attached to the explanation of the humorist: "Examinations are often made for fools who cannot get placed otherwise!"

In conclusion, we may say that the higher civil service of the Third Republic suffered from some serious shortcomings generally recognized and deplored, and yet not remedied owing to the instability of cabinets and passionate internecine social conflicts.<sup>22</sup>

(1) The various departmental services were highly specialized not only by function, which is natural, but by their educational preparation. Apart from the general education at the *lycée* or schools of that level, any general common state of mind was disrupted by specialized professional preparation of the kind already described. This flew directly in the face of the common sense of the French liberal critics, and compared unfavorably with the theory and practice of the higher civil service that efficiently prevailed in Brit-

ain. We have said that integration begins in the schools: France destroyed it, and the various government departments deliberately did so on wrong theories and for unworthy motives. What the departments put asunder, the unstable cabinets could not join: a united mind.

(2) Probation and apprenticeship were not real. No attempt was made to give postentry training, none to put the entrant through stages of practical work, and hardly anyone that entered was ever dismissed for unsuitability.

(3) The intellectual education received in the various schools that particularly provided for entrants to the public service was of a high grade, the highest in the world in point of the severity with which the student was compelled to attend to his studies. But it was heavily theoretical and synoptic. It was, in a sense, highly technical, even if the subject were law or economics. One has only to examine the textbooks to be convinced of this. The formulas were all cut and dried. They were answers but not thought-provoking problems. They did not whirr as reality whirrs. The studies had a remote, antiquated, uncontemporary, thin flavor about them. The truth was that France had dangerously slipped from any proper level of excellence in economic and political science studies: the books did not exist because Frenchmen did not write them. The reader will look in vain for a Hawtrey, a Keynes, a Robbins, a Hansen, a Wesley Mitchell in economics in the Third Republic. He will, in political science, miss a Corwin, a G.D.H. Cole, a Sidney or Beatrice Webb, a Graham Wallas, a Walter Lippmann, a Walton Hamilton, a Lawrence Lowell, a Laski, a Jennings, and so many others, and he will find nothing like the great series of commission and committee hearings and reports on administrative reform that adorn the Anglo-Saxon countries in the last four decades.

(4) All these things together resulted in a resistant autonomy on the part of the various departments and bureaus, an unintelligent *amour propre* that was culti-

<sup>22</sup> Nearly all the criticisms were aired vigorously in the Assembly, *Débats*, *Journal Officiel*, February and June, 1945.

vated and affected to the point of non-cooperation and even obstruction.

(5) Between the grade of *réducteurs*, the administrative type, and the executive-clerical class, the arrangement of functions came to be confused, because no care was taken to establish and maintain the clear distinction between the higher duties and the routine. In departments recruiting from time to time for themselves, as vacancies arose, with their own division of functions, it often became convenient out of sheer slovenly expediency to give the lower ranks the work of the upper and the upper the work of the lower. The only way to check this is by the establishment of a class which runs through all departments, given integrity by a common education, a common examination, and a common status.

(6) Since no common class existed with its own career prospects, some departments attracted brilliant and ambitious men, while others could not even be filled. A single department, when it is of mediocre significance in the state and yet needs to be manned as much as do the others, is not an attraction when it is a trap into which one enters without the later chance of transfer. To be a member of a single class available for all employments, and with a right to request transfer and change in relation to all other promotees, spreads talent, and saves some of it from permanent frustration.

(7) The promotion system, from grade to grade, required that the promotee should go into the next higher position—by law. To make room for those who deserved promotion, more jobs than were necessary for the work were created. No notice was taken of comparative ability: promotions were given out of good nature. If men of special merit were required, some grades ahead, then they were often brought in by the minister by special decree, or some were brought in on an unestablished basis. Yet this produced more frustration for those who expected promotion, but who were defeated by the lack of rational system in the composition of the service.

(8) The service was on the whole

manned by the upper bourgeoisie, which was not energetically democratic and in some of its branches was actually and even fiercely antidemocratic. Now, on the whole there were some opportunities for working-class and middle-class brains to get to the universities in France, because secondary-school education was freer than in England thirty years ago, where the number of free places in the secondary schools was strictly limited. Yet the cost of tuition and maintenance in the post-*lycée* period, at college or university, was a class restriction on entrance into the public service.

Now, much has been made of the social and political conservatism and antidemocratic flavor of the recruits entering from the *École Libre des Sciences Politiques*. Some observations on this subject are necessary. The school was established as a private foundation, with funds supplied by rich donors, in 1871, by a notable student of political science, Émile Boutmy. The purpose was to restore French government and administration after the defeat by Prussia, and especially to bring into political science and administrative studies some of the pungent air of reality these had always had in the nation across the channel. Several generations of publicists, politicians, and administrators were taught there to serve the Republic. It was a splendid idea!—but the school had its deficiencies. The first was that it could not of itself repair the specialization of teaching forced upon it by the structure of the administrative services themselves, and the nonexistence of a single administrative service which had a common education and was selected annually by a single assembled examination. Its teachers were inclined to *laissez faire* in economics and the legalistic approach in constitutional and public law. And it was, in the main, a school for the wealthy. During World War II it fell into irretrievable disrepute,<sup>23</sup> since the defeat was blamed on its teaching and products—

<sup>23</sup> Cf. *Débats, Journal Officiel*, June 21, 1945, especially observations of André Philip, *rapporteur-général* of the *Commission des Finances*.

and though this was far from being wholly just, there was enough in the charge that could be justified.

This judgment so far as it was well-founded took its grave importance from the kind of view expressed by Daniel Halévy: "Republican France has, in reality, two constitutions: one, that of 1875, is official, visible and fills the Press—this is parliamentary: the other is secret and silent, it is that of the Year VIII—it is the Napoleonic constitution which vests the direction of the country in the administrative corps."<sup>24</sup> One credible and gallant witness, by profession a member of the *Conseil d'État*, declares<sup>25</sup> that the upper ranks of the administration were taught by anti-Republican and even reactionary professors, leading to enmity to the Republic. He asserts that it was well-nigh impossible to get into the *Conseil d'État* or the Inspectorate of Finances and other departments without studying at the *École Libre des Sciences Politiques*. André Géraud, writing as *Pertinax* about "the Gravediggers of France," passes from blaming the Treasury officials to blaming the school which nurtured them:<sup>26</sup>

As I looked over the programs listing the various subjects taught in this institution, I was often amazed at the number of degree-spangled pedants who now replaced the founders. The majority of Treasury officials were recruited from this school. Vanity of examinations and competitions! These fellows were not chosen because of their intrinsic merit, the strength of their personality, or their fine character, but merely because of the supposed orthodoxy of their views, their powers of mimicry, their connections, and their position in Parisian society among the two or three thousand people who held the big jobs, set the fashion, handed out favors, and made the law. . . Inspectors of Finance [Treasury officials] were one huge family, and that connection could not be called healthy.

<sup>24</sup> Cf. his *Décadence de la Liberté* (London, 1931).

<sup>25</sup> Pierre Tissier, *I Worked with Laval* (London, 1942), p. 7 ff.

<sup>26</sup> "Pertinax," *The Gravediggers of France* (New York, 1944), p. 364 ff.

These men had loyalties, but they were not to the Chamber of Deputies; they had abilities but not those of a larger republican statesmanship. It was quite a habit of the Treasury officials to go into the employment of high finance after a few years in office. The double fault of the higher administration was that the officials were authoritarian and that the disjointed structure of the departments ruined the usefulness of such professional competence—in some, very high—and loyalty to the nation—in some, to *their* conception of the nation, very deep—as they had.

(9) The high officials, overdoctrinaire and disunited as they were, could not be and were not coordinated, harmonized, and driven toward objectives of national policy seen as a whole and steadily pursued. For the cabinets, their masters, were never in office long enough to make an impression, but always in office just long enough to cause an annoying disturbance and the comfortable sniggering reflection among officials that they were on the way out.

(10) Finally, the central departments, particularly the Ministry of the Interior, the Treasury, the Ministry of Justice, the Ministry of Education, and the *Conseil d'État*, were the strict unifying masters of all the French local-government units—*départements*, *arrondissements*, *cantons*, and *communes*. Though some decentralization had lightened the weight of financial and administrative controls emanating from Paris during the lifetime of the Third Republic, *la tutelle*, the central tutelage over policies, appointments, activities, and the regular budgets, was still one of the most rigorous and exacting in the world.<sup>27</sup> It operated in the main through the *préfet* in the *départements*, though the central offices' inspectors were also its instruments; and the *préfets* and his adjutants were the nominees of the Ministry of the Interior. Whatever was "bureaucratic," officious, and narrow-

<sup>27</sup> Cf. R. Maspétiol and P. Laroque, *La Tutelle Administrative* (Paris, 1930). Cf. also R. K. Gooch, *Regionalism in France* (New York, 1931).

minded in the capital, got itself reflected at any rate to some extent through France, with the exception of the big cities like Lyons or Marseilles. French local services were very backward compared with those in Britain and Germany.

The French Third Republic fell not only through the drying up of the sap of mind and devotion of all its high officials, but this had failed so badly as to make the radical reconstruction of the higher administrative service one of the principal anxieties of the Fourth Republic.

#### THE HIGHER CIVIL SERVICE IN THE FOURTH AND FIFTH REPUBLICS

AN attempt was made in 1937 to reform the recruitment of the higher civil service. It failed in the Chamber of Deputies chiefly because the problem had become so complicated that a democratic assembly in the conditions of the Third Republic could not see and force its way through all the jungle of vested interests, official and academic.

It is noteworthy that such a reform could only come in the wake of resurgence after defeat, and in a régime which was still of a zealous, warrior temper, and not yet delivered back to the habits of the Third Republic's politicians.

General de Gaulle, then head of the provisional government, commissioned a member of the *Conseil d'État* to undertake the mission of preparing a radical change.<sup>28</sup> It comprised a simultaneous reform of the higher administrative service and of the educational system: for a reform of one without the other was now acknowledged to be useless. After deliberations in the *Conseil d'État*, the Council of Ministers, and the Consultative Assembly, the combined ordinances, decrees, and regulations were published on October 10, 1945.

*The Administrative Reform.* Instead of the single *rédauteur* grade, which had here and there become confused with the

executive and clerical officers, two high grades were now established: (1) civil administrators and (2) secretaries of administration.

The civil administrators are the group for which the recruitment reforms chiefly provide. They are almost identical with the British administrative class, and were consciously modeled upon it. All, wherever they serve, are subject to the same broad disciplinary rules, and they constitute one single group and career, whichever department they happen to serve at any time. Their hierarchy going upwards is: administrators-adjoint, administrative class 3, then class 2, then class 1, and then class "exceptional." All of these are recruited through a newly instituted *École Nationale d'Administration*, from now referred to as the School. Their function has been described as:<sup>29</sup>

to fit the conduct of administrative affairs to the general policy of the Government, to prepare drafts of laws and rules and ministerial decisions, to formulate the directives to their execution, and to coordinate the march of the public services.

On the other hand, the secretaries of administration were rather like the "executive class" of the British civil service. The same authority describes them as "the technicians of the administrative services." He says of them:<sup>30</sup>

Their task is to assure the works of execution, current operations, and certain specialized functions which require sound administrative knowledge and experience.

They could be called top office managers. They fall into a managerial group, and two special categories, accountants and translators. These are recruited by an examination which is open to officials aged 35 and over and having five years of public service, and to young persons between

<sup>29</sup> Cf. Marcel Debré, "La Réforme de la Fonction Publique" in *Revue d'École d'Administration*, May, 1946, p. 34. Cf. also the annual calendars of the School, *L'École Nationale d'Administration* (Imprimerie Nationale, 1947), and the series continuing the *Revue*, entitled *Promotions*.

<sup>30</sup> Debré, *op. cit.*, p. 34.

<sup>28</sup> This was Marcel Debré (*Maître des Requêtes*) and then commissioner for the region of Augers, with France still under a war régime.

the ages of 18 and 25, holding a diploma of higher (secondary) education or the equivalent.

*The Civil Administrators.* The position of the administrative class, as it may be called henceforth, is clearly distinguished by its recruitment, its functions, its career.

The first task of the state is to assure itself of a flow of properly talented recruits for the administrative service. The School is concerned with the task of their further formation once it has found them. Essential to the discovery is the general prescription of what is being sought. This is described by the principal architect of the reform in these words:<sup>81</sup>

The "administration" is diverse in its composition. In this generic term are wrapped up services of very different nature. There are civil services of a purely administrative character and technical services, metropolitan and colonial services, home services, and services abroad. The magistracy, the university, and the armed forces are equally part of the administration.

It is diverse in its structure and its members. Certain services have a simple character of execution and those who carry them out have no part in the direction of the affairs of the State. Others, on the contrary, are at the very heart of the life of the nation, and their officers may be considered as influential collaborators of the political authorities.

When we talk of a School of Administration and when one envisages the administrative reform bound up with its establishment, the word "administration" has a special sense. It means that combination of services of a civil character which constitute the superior structure of the State and whose members have as their principal task to prepare or study the decisions of Parliament and the Government and then to direct their execution. It is among these officials that the Government would naturally choose a great number of its high officers, notably those who will occupy the situations which wield authority or of administration linked with policy.

Of the relevant services these principal ones come rapidly to mind: the central administrations of the ministries, the prefectural and diplomatic services, the services of inspection, the administrative bodies concerned with law-making and control (the *Conseil*

*d'Etat* and the Court of Accounts). There are others like these.

This general description is vividly reminiscent of Macaulay's formula for the British civil service.

The French government rejected two ideas formerly suggested for the education of such a higher administrative career. One was modeled on the idea of the *Polytechnique*. Here quite young men at once entered their career and were educated to it in this school, whence after three years of study they went off to their actual jobs. But this meant that the candidates were far too young and immature, coming direct from secondary schools. The tendency would be to impress upon them a single identical outlook. General culture would have been sacrificed to narrowness of the specialized administrative outlook—in a field where breadth was of the utmost importance. It was felt to be a little undemocratic, since it might be that those who had so young felt or been persuaded of the appeal of public service might be of an authoritarian temper, and only a small social class could afford such an education. Another idea was to bring from the universities to a special school of administration each year entrants chosen by competition. Here they would be prepared for their administrative service examinations. The students accepted would have their board, lodging, and tuition fees paid by the state. This idea was discarded, as it stood, because it did not thoroughly enough grapple with the kind of education given at the universities.

Two new ingredients were necessary: better university preparation of recruits for the public service, and a new institution for the intelligent development of those who had shown prowess in the new university stage.

*The Reform of University Education.* In the universities, and within the authority of the universities, there are established Institutes of Political Studies, or, in other words, faculties of political and social sciences. Their object is to co-ordinate and develop the work hitherto

<sup>81</sup> *Ibid.*, pp. 10-11.

undertaken by the other faculties in the teaching of economics, administration, and social studies, and to educate students in the work-methods and concrete problems of administration and social life. The true scope is the whole of the social sciences: the new object, animation and creativeness after so long a period of intellectual and spiritual infertility.

For some years the institutes will be established only in Paris, Strasbourg, Toulouse, and Lyons, for it is recognized that the reform will stand or fall by its products, and it is not deemed possible that enough of the right kind of teachers can yet be found for more institutes. No institute may come into existence unless its faculty, curriculum, and methods can first pass the very strict scrutiny of the *Conseil d'État*. Students can enter the institutes if they have a diploma of higher education (advanced secondary) on the list approved by the School. All candidates for entrance who deserve it and are needy are granted scholarships by the state. The state enters through its grant of scholarships, and also through the membership of certain officials and the director of the School on the "councils of improvement" which supervise the development of each institute, and through the president of the Council of Ministers' approval of their curricula and administration. The other connections between the state and preparation for the higher administrative service will become apparent later.

In their first year the students take an almost identical common course; in their second and third, many optional courses are permitted to accommodate some natural appetites and vocational interests. But specialization is banished. The purpose of the studies at the institute is a broad, liberal education, through the medium of the faculties of law and the humanities, with the additional focus of the social sciences. The education is by lectures, discussions, practical tasks, and seminar work. The teachers are the university professors and various authorities from the services and outside affairs, the latter to give a guarantee of "animation."

A severe examination at the end of the first year expels students not up to standard. After three years' work, a final examination leads to a diploma. The diploma is crucial—it is the first qualification for entrance into the School for those who do not come in by way of membership of the public service: it is the principal key to the public service at the top administrative level.

*The School: L'École Nationale d'Administration.* The School serves several purposes, incident to the formation of cultured and practical-minded civil servants. It replaces the separate, departmental, specialized entrance examinations, by a single annual competition. It provides for the people with talent but without means, because those who are admitted receive adequate payment as officials for the three years for which their studies now proceed. Receiving annually about ninety entrants who have already given proof of exceptional ability, the School has designed a combination of instruction by books and classes with a very clever succession of practical work-stages, in order to focus, make more concrete, living, and actively responsive to administrative tasks, their mind and habits.

Once again the students cover many subjects in the whole field of the social sciences: for illustration, the list includes administrative law and organization, legislation, administrative justice, fiscal and budgetary law, public accounts, public credit, economic legislation, labor relations, colonial organizations and legislation, international law, foreign policy and international problems, statistics, population theory, town planning, currency and banking, commercial policy, international transport, hygiene and preventive medicine, and social security.

Above all, the School sets its face sternly against the production of officials by mere book-knowledge, and against the merely formal principle of probation, which (as in almost every public service) had become a dead letter in practice. Most of the time at the School is spent in prac-

tice in the various administrative agencies.

What is of equally outstanding interest is that the School deliberately addresses itself to the problem of the moral cultivation of its officials. It will be remembered that it was to this that the mind of the English reformers of the middle nineteenth century was addressed, and we have already observed that the problem of character is one that still baffles those who recruit for the public service. The observations of the principal author of the French reform on the problem of moral education are particularly significant and well-styled, for they offer an insight into the nature of the civil service in the modern state. He says: <sup>32</sup>

It is not part of the mission of the School to play politics or to impose a doctrine. But the School must teach its future officials the sense of the State; it must make them understand the responsibilities of the administration, cause them to taste the greatness and accept the servitudes of their profession. It must do more. By a continuous effort made by its best professors, by recalling great examples and the great men in history, it must give to its pupils the taste for certain cardinal qualities: the sense of the humane that infuses life in every kind of work, the sense of decision which permits the taking of decision after the risks have been weighed, and the sense of imagination which is not afraid of any daring, any great deed. And even more than that. The founders of the first school of administration placed high hopes in the spirit which would animate their students. They were right, and it is proper today, on the eve of the years when the obligations of the service of the State will be heavier than ever, to relive the faith of the republicans of 1848 in the value of moral virtue taught and understood. When such is invoked, certain persons prick up their ears: they fear the reverse of the medal: a spirit of caste which would pervert the administration. But their judgment is superficial. The variety of the sources of recruitment for the School, the maturity already attained by most of its students, the determination to make them participate by numerous practical activities in the difficulties of life, are some of the elements which will prevent the School from becoming a closed chapel.

This ideal is so clear, that all that is now needed to make the services of the School plain, is a brief and bare description of its procedure and organization.

There are two separate examinations for entrance into the School, one for the students, the other for officials already in the public service. The former is taken by persons less than 26 years of age and holding the diploma of the institutes of politics, the latter by officials between the ages of 26 and 30 provided they have been in the public service for five years or more. (Some of the secretaries of administration will thus get their opportunities to rise.) The examinations are in the fields of political science and economics, but general themes, not specialized, are set the students. The generality of the examination extends to the setting of subjects covering a much wider field of university studies than those in the institutes, in order that those who have not yet thought of becoming civil servants should not be excluded from deciding to do so at this stage. The entrants from the civil service, who have not had time to acquire a general education, are given a specialized examination without a foreign language. All take a physical examination of some severity, and it may be added that all candidates must have accomplished their military service. The final proportion between the two classes of entrants will be decided by experience.

The School is organized in four sections: general administration, economic and financial administration, social administration, and foreign affairs. The candidates declare into which of these they would like an admission. The theory is that candidates should be given the opportunity of entering the vocation of their spontaneous choice, and that as specialization is inevitable, it should be neither ignored nor pushed to an extreme. In the entrance examinations, questions are provided enabling candidates to offer answers within their specialty; but care has been taken to avoid anything like four separate examinations. The examiners look for general culture, personality, and character, and the latter are appraised by

<sup>32</sup> *Ibid.*, p. 22.

## RECRUITMENT IN FRANCE

a very broadly constituted board of interview. Students are listed in the order of merit on one single list according to marks obtained, and they choose what section they wish to enter according to their place. If they cannot get into the section they want, they must go into some other—or try again next year.

Now that they have been admitted into the School, students come under the disciplinary code of the civil service, receive a salary, and commit themselves to serve the state for a period of twelve years, and, failing this obligation, to pay back to the state the three years' salary received at the School.

The three years are divided into a first year of practical work, and mixed arrangement of schooling and practical work in the second and third years. At the end of the three years the student-officials are classified by aptitude and competence: the incompetent and unworthy are expelled (they may be dropped for cause at any time during the three years). Their grades at the final classing are composed to the extent of one half for practical work and schooling, and one half on their final examination—and they are classed in their sections. But a general classing is also drawn up so that certain administrations like the *Conseil d'État* may take their recruits from diverse sources.

The governmental agencies which have so far been designated to be served by the graduates of the School are the *Conseil d'État*, the Court of Accounts, the highest level of the central administration of the ministries, the diplomatic and cognate services, the general inspectorate of finances and the general inspectorate of the administrative services, the inspectorates of labor, the administration of Algeria and the civil control of Morocco and Tunisia, and the prefectural career. The relative centralization of French government makes all these posts of more than usual importance. As regards the prefectural career, the present innovation is of especial importance since it brings to completion the development of the last three decades tending to take the career of prefect out of politics, and, furthermore, it is

the intention to create one service of the central controlling authority, the Ministry of the Interior, and its field services in the *départements*.

When the recruits enter the actual service of the state, they enter—like their counterparts in Britain, the assistant principals or administrative cadets—into a *début* stage. Some places, however, are kept for outsiders and promotees. Some places, also, are not available, since the ministers in their own discretion may make the appointments to positions of "direction and authority."

*The Practical Training.* Social value is placed by the School on the stages of practical training. It is, above all, desired to remedy the defect of all previous methods of recruitment, namely, to overcome the entirely theoretical knowledge by practice before the candidates enter on their own executive responsibilities. The critics of prewar French administration emphasize that its officials were more content to write a clever letter or a very complete report, or well-turned memorandum, rather than act anew. Moreover, it is desired to overcome whatever may still remain of the big-city outlook of the entrants by sending them to participate for some time in the provinces and the overseas territories, and also, to bring about the earliest possible contact between officials and labor unions, since so many come from the middle class. In addition, there are practical arts to learn from those already exercising executive responsibilities.

The various stages of practical training have been most carefully and precisely devised after comprehensive consultations with civil servants, with school groups concerned with scientific personnel management, and with private experts. The stages include spells of time in provincial and local administration in France and the overseas territories, in the central departments, and in the *Conseil d'État* and the various controls and inspectorates. There are stages of service in the different parliamentary bodies. The next series of experiences take place in the nationalized industries, and in private business of

large and middle size which are soundly organized. The demands of a planned state, as well as the previous poverty of economic studies in France, have conduced to this stage, and there must be added the desire to impress the student with the idea that planning is not easy and that there is value and life in sound private enterprise. Finally, some if not all students, will spend some months abroad in the French services or in foreign public services or private enterprise.

What will be gained by this very well devised system of practice, or in-training besides a vivid, synoptic view? This:<sup>33</sup>

By such contacts, the future civil administrators will drink in progressively the sense of what is real and efficacious, the taste for action and personal initiative, a large comprehension of the most diverse social places, a comprehension made up of the knowledge of men and things, and also, let us hope, that sympathy for men which is the condition of all great work. . . . By the end of these administrative training stages, the students will have acquired the sense of the State, not of a state abandoned to instable passions or disdainful of personal and local liberties, but of a state charged with pursuing in time, with continuity, its work of social progress imbued with respect for these liberties.

*Further Education.* France, like Britain during World War II, discussed the proposal that an administrative-staff college should be set up to cater for higher officials, as well as the younger generation, where all might be improved in general knowledge and administrative technique. This was inopportune. But something like it, to fulfill the task of refreshing those long in the service, was adopted, in the *Centre des Hautes Études*, the Center of High (Advanced) Studies. Its purpose is to re-educate and refresh officials who have been at work for some years in the technical and specialized and local services, those who have become blinkered through service in the same department for a long time. Its object is to bring them up to date, to enable them to widen their knowledge by the study of new problems, and to regain some breadth by mingling

with officials from other services and with men from outside the service. The courses and classes fall into three categories: general administration of the services managed by government for metropolitan France; imperial problems, like the political, economic, social, intellectual, religious problems arising out of the relationship between metropolitan France and the overseas territories; and the theory and practice of industrial enterprise and control by the State. Yet many important problems are studied in common by all those who attend the Center.

The Center achieves its object by means of lectures, discussions, research work, and practical in-training in the administration and in private industry. A carefully formulated scheme of "secondment" and rotation, bringing persons from the localities and overseas to the capital and sending some off abroad, is designed to lighten the monotony of their current careers.

The condition for entrance is to be between the ages of 30 and 45 and to have spent at least six years of service; or, to make room for entrants from outside, to have spent an equal time in private enterprise. A diploma certifies proficiency in the Center. It does not entitle its holder to office or promotion; but entrants from outside public administration, having gained a diploma, can use it as a qualification for entrance into the service.

*The Personnel Agency, the School and Center.* Thus it is hoped that the institution of the School will provide the regular entrants to the higher service from among the ninety or one hundred students accepted annually, and that the Center will help to revive the enthusiasm of the older generation. It must be borne in mind that these reforms are part of a renewal of the French state by men who took the leading part in the Liberation and in very many cases the resistance against the German occupation. The whole is infused with a spirit of high endeavor and action. Extra marks are given to students for athletic prowess, especially for ability to pilot an airplane or glider, or to parachute-jump. The designations taken by some of the classes already entering the School give

<sup>33</sup> *Ibid.*, pp. 59-60.

the pungent flavor of action: "Fighting France," "The French Union," the "Cross of Lorraine," the "United Nations."

The School is housed in the former premises of the *École Libre des Sciences Politiques*. It is maintained at the expense of the State. Its first director is a noted resistance combatant and one of General de Gaulle's former administrators in Brittany during the Liberation.

The connection of the School (and of the Center, since for the time being, the Center is administered by the director and council of the school) with the government is exceedingly interesting. It is directly within the authority and under the aegis of the president of the Council of Ministers. Under the president a direction of Public Service has been instituted to prepare the lines of a general policy for the public services and to build up documents and statistics. It formulates the coordination of status, principles of salary, pension schemes, and the organization of the services. It is assisted by one commission composed of the personnel directors from the various departments, and another representing the professional organizations of the officials. Side by side with the Direction is a Permanent Council of Administration. It is charged with studying and elaborating a policy for the public services, and, under the authority of the government, with imposing it on the whole administrative system, and thereafter with supervising the fulfillment of the statute of the public services. It is the sole council of discipline for the officials of the services recruited by the School. It is composed of a chairman, who is a president of a section of the *Conseil d'État*, six officials (three nominated by the civil service unions), and two persons from outside the civil service. The members are appointed in the Council of Ministers each for six years.

The School itself is administered by a

director and a council of administration. The former is appointed by decree made in the Council of Ministers, and he cannot be dismissed without the reasoned decision of the School's council of administration. The council of administration has as its chairman, *ex officio*, the vice-president of the *Conseil d'État*. It contains members from the universities, the officials, and persons from outside the service, all nominated by the government. One of the officials is the Director of the Public Service, that is, the director of the bureau serving under the president of the Council of Ministers. Two of the officials are nominated by the civil service unions. The director of the School is assisted by an adjutant who is charged with organizing the practical training of the students and supervising their progress. The teachers at the School are drawn from the professors and administrators, and from outside these groups.

The discussion may well conclude with the remarks from a speech by the first director of the School on the occasion of the first commencement:<sup>34</sup>

The School must be a great School, *the* great School, into which one will be proud to enter, and from which one will be glad to graduate, which will form the best, the most poised, the most humane, the most sound of men. For such, tomorrow, must be the splendid officials of which the nation has need.

It will have been observed that here, in France, as in Germany and Britain, the problem of the higher civil service is approached in an atmosphere of dedication of service to the "State" which is the immediate incarnation of the national society. It is interesting to compare this with the manner in which the problem of the upper administrative levels is envisaged in the United States.

<sup>34</sup> *Revue de l'École Nationale d'Administration* (Paris, May, 1946), p. 55.

## *The United States Civil Service*

AMERICAN experience of administration has been vastly different from anything we have so far described, for the offices of state and their services have been used—to an extent and for a span of time (until 1883) unparalleled in any other country—as the “spoils” of the victorious political parties. The reasons for this have already

they now stand. On June 30, 1947, the civilian employees in the executive branch in the continental United States numbered 1,849,781. Of these, 1,698,568 were subject to the competitive examination requirements of the Civil Service Act, amounting to 92 per cent of the total. This left 151,213 employees excepted from

TABLE 27—UNITED STATES: PERCENTAGE OF EXAMINABLE POSITIONS IN THE CIVIL SERVICE, 1883-1939

<i>Year</i>	<i>No. of Positions Subject to Examination</i>	<i>No. of Positions In the Civil Service</i>	<i>Percentage of Positions Examinable</i>
1883	13,780	131,208	10.5
1888	29,650	159,356	18.6
1893	45,821	180,000	25.45
1899	94,893	208,000	45.62
1903	154,093	301,000	51.19
1909	222,278	370,000	60.08
1913	292,460	435,000	67.23
1918	592,961	917,760	64.6
1924	415,593	554,986	74.8
1928	431,763	568,715	74.9
1930	587,665	608,915	67.7
1939	622,832	920,310	67.67

been given in part, and will be treated again presently. The remarkable and laudable progress since 1883 is shown in Table 27.<sup>1</sup>

Before entering upon the discussion, it is convenient to present the significant statistics of the United States civil service as

competitive requirements—a grave exception, yet in proportion to the total smaller by far than at any time in the history of the Republic.

As can be seen from the figures, the mighty days of spoils have passed away, and Europeans who still have “spoils” in their minds when they speak of the United States must modify their images very seriously. The largest amount of “spoils” are in the state and municipal

<sup>1</sup> Figures from 1883-1924 from *Annual Report*, U. S. Civil Service Commission, 1925, Vol. VIII. Figures for 1928, 1930, and 1939 from the Annual Reports of these years.

services: the federal government has cleaned itself.

#### THE PERENNIAL PSYCHOLOGY OF SPOILS

How did the federal government become sullied and what were the stages in its purification? Those in power in the state, whatever its form (monarchy, oligarchy, dictatorship, or democracy), are always likely to abuse their power to make appointments to public office. They are, at any rate, normally more likely to do this than to subject themselves to the prohibitions and difficulties required by attention to the public well-being. The public well-being is impersonal and intangible, it is comprehensive and remote, while the satisfactions to be obtained by following personal caprice in appointments are immediate and vivid. When one's own good is the first consideration—as, for example, in business—the conditions for the appointment of those best qualified to produce what is required are present, and in the long run, if bankruptcy is to be avoided, they prevail. But the results of public service are often impalpable, distant from the vicinity of the maker of appointments, and it still takes a great deal to ruin a whole nation by wasteful organization and extravagant payments to inefficient servants. Hence it is not a matter for surprise that a "spoils" system should have grown up in the United States: the amazing thing is that a democracy spreading over an area thirty-two times the size of England should ever have limited that system and controlled its own worst impulses in order to establish a system of appointment by merit! As Montesquieu has said, a democracy has peculiar need of virtue, for when, in other régimes, inefficiency is observed, there is the refuge of democracy, but if the people themselves lack virtue, where shall one turn? Yet a democracy is peculiarly liable to demoralize its administration; for its basic tenet is the equal worth of all men, while its fundamental machinery is a party system. The former causes all to demand a place, the latter must be stoked into continuous service by the provision

of concrete satisfactions, money payments, honors, or public office.

We do not wish to describe in detail the progress by which the federal service of the United States proceeded from "spoils" to proficiency. Suffice it to say that the system of spoils began on a minor scale and apologetically with Washington, Jefferson, and Adams, became a torrent in 1829 when Jackson came into office, and from that time until 1883 swept through all the offices of government without legal let or hindrance, and most usually without moral inhibitions. From the Pendleton Act of 1883, when the Civil Service Commission was established, civil service positions were successively "classified" and subjected to objective rules of appointment, and the "spoils" system was steadily contracted. The questions which interest us are: (1) what were the discernible motives of the "spoils" system; (2) what were its effects, its machinery, and the obstacles and impulses to reform.

*Motives of the Spoils System.* (1) Spontaneous friendliness, conviviality, and generosity produced and produce spoils. We have to steel ourselves against such impulses to confer benefits upon our elective affinities, those who please by their manner, but especially upon our relatives. The lust of prestige, the feeling of power and virtue which nepotism produces, are very seductive, and compared with these things, the chances of being applauded for services to the Republic, especially in a party system of government, are faint. Moreover, it is easier to give away what belongs to the unseen public than what belongs to yourself. Vicarious generosity is one of the plagues of the world.<sup>2</sup>

(2) A more powerful motive in a democracy is the maintenance of one's own view of the constitution, the laws, and

<sup>2</sup> C. R. Fish, *The Civil Service and Patronage* (Harvard, 1904) p. 59: "In 1821 John Quincy Adams said that one-half of the members of Congress were seeking office, and that the other half wanted something for their relatives." Cf. L. D. White, *The Federalists* (New York, 1948) for this period.

their proper application.<sup>3</sup> It is argued that none will know this so well as one's own political nominees, and none will be so zealous as they. Hence an impulse to proscribe all opponents or neutrals and to appoint only indubitable friends. It is not relevant that opponents are technically efficient: that is an argument in favor of their proscription.<sup>4</sup> Better an incompetent supporter than a competent enemy. As a Massachusetts Republican clergyman preached in 1811, "But if ye will not drive out the inhabitants of the land from before you, then it shall come to pass that those that ye let remain of them shall be pricks in your eyes and thorns in your sides, and shall tear you in the land where ye shall dwell."<sup>5</sup>

(3) In a democracy, based as it is on party organization, the need for some commodity with which to induce and repay electoral services is great, and the greater it is, the larger the number of elective offices. In the United States this motive to create and use "spoils" was exceedingly strong, especially from the 1820's onward through the joint effects of the rising tide of democracy and the in-

creasing area of settled government.<sup>6</sup> This was the main cause of "spoils."

(4) The theory of "the rotation of office"—that office should not be held for long periods by the same incumbents and that everyone should have a chance of office—was put forward and practiced from a variety of motives. It was a means of stopping government from becoming a caste alien to the people,<sup>7</sup> a means of maintaining the responsibility of officials to the people,<sup>8</sup> and in a democracy, based on the idea of the freedom and equality of citizens, it was claimed that all should have an opportunity.<sup>9</sup>

(5) As soon as one party began to proscribe enemies, the other party was obliged to do so; and the question then became, who would stop first? When that received no answer, the question became, could enough members of both parties stop at the same time, and how could they be induced to do so?

Not until 1883 was this question really answered, although the reform movement had begun over a decade before; and it was answered by a few politicians of abnormal decency with the help of the National League for Civil Service Reform. But first, of the effects of the "spoils system."

*Effects of the System.* An enormous number of offices—most, in fact—fell into the hands of the politicians. Every four years a large clearance was effected, and during each Presidential term other violent changes occurred. Sheer inefficiency was the first result; an increase in public costs the second; the creation of a class of office-seekers the third; political corruption the fourth;<sup>10</sup> a standing battle be-

<sup>3</sup> Cf. Jefferson (cited in Fish, *op. cit.*, p. 35): "If the will of the nation, manifested by these various elections, calls for an administration of Government according with the opinions of those elected . . . [T]his [removal of and replacement of officials] is a painful office; but it is made my duty and I must meet it as such. I proceed in the operation with deliberation and inquiry, that it may injure the best men least, and effect the purposes of justice and public utility with the least private distress; that it may be thrown, as much as possible, on delinquency, on oppression, on intolerance, on ante-revolutionary adherence to our enemies. . . . It would have been to me a circumstance of great relief, had I found a moderate participation of office in the hands of the majority. I would gladly have left to time and accident to raise them to their just share. But their total exclusion calls for prompter corrections. I shall consult the procedure; but that done, return with joy to that state of things, when the only questions concerning a candidate shall be, Is he honest? Is he capable? Is he faithful to the Constitution?"

<sup>4</sup> Lincoln used the "spoils" system to build up the Republican party. Cf. Fish, *op. cit.*, p. 170 ff.

<sup>5</sup> Cf. Fish, *op. cit.*, p. 97.

<sup>6</sup> Marcy's speech and cf. Fish, *op. cit.*, p. 156; for the contemporary prevalence of the idea see *Better Government Personnel* (New York, 1936).

<sup>7</sup> Ellbridge Gerry: "Rotation" "keeps the mind of man in *equilibrium*, and teaches him the feelings of the governed, and better qualifies him to govern in turn." (Fish, *op. cit.*, p. 81.)

<sup>8</sup> *Ibid.*: "a check to the overhearing insolence of office."

<sup>9</sup> Jackson's message.

<sup>10</sup> Cf. Henry Clay (1829): "Incumbents, feeling the instability of their situation, and knowing their liability to periodic removals, at

tween the President and the Senate for the control of appointments and removals a fifth; and a terrific waste of time and labor on the part of the President and heads of departments, coupled with the real pain of refusal of applications for office, the sixth. Never had a state been so debauched. Officials were chosen through the loosely jointed machinery of Congressmen and the local party "bosses." Moreover, the parties preyed upon the officeholders' salaries, by "assessing" them at so much per cent for contributions to campaign funds, and this again caused a counterpressure for higher salaries, so that indirectly the parties were paid by the state. Finally, the political appointees were obliged to be politicians all the time to secure their future reinstatement. Worse still, politics and administration fell into public contempt.

*Machinery of the Spoils System.* How could the state continue to exist without governmental downfall? Even in a "spoils" system some good officers are chosen; and even in a "spoils" system there is not a clean sweep at every party change, since the newly elected executive has regard to his public prestige and has a modicum of regard for the public good, and once elected is independent for four years. There were Presidents who stood out against the removal of capable officials. Further, a long spell of office by the same party mitigated the revolutions in the service. Then it takes a great force to damage public administration very badly and very obviously. Finally, not until the 1870's and 1880's did the pressure of a complex, technical, and expectant civilization cause the federal authority to become active on a large scale requiring urgently a body of permanent and specially skilled officials.

Through what instrumentalities had the "spoils system" worked?—of course,

short terms, without any regard to the manner in which they have executed their trust, will be disposed to make the most of their uncertain offices while they have them, and hence we may expect immediate cases of fraud, predation and corruption."

through the powers of appointment and removal. The constitution says that <sup>11</sup>

[the President] shall nominate, and by and with the advice and consent of the Senate, shall appoint ambassadors, other public Ministers and consuls, judges of the Supreme Court, and all other officers of the United States, whose appointments are not herein otherwise provided for, and which shall be established by law: but the Congress may by law vest the appointment of such inferior officers, as they think proper, in the President alone, in the courts of law, or in the heads of departments.

As to the power of removal, as we have shown, it is disputed whether it is an unlimited and illimitable power of the executive, or whether the Senate must be consulted, and whether Congress, having established an office and settled its tenure, thereby limits the Presidential power of removal.

What of the evolution of these powers? (1) "Ambassadors, other public ministers and consuls, judges of the Supreme Court" and all other officers—not "inferior" officers that is, at least heads of departments—were left to the tender mercies of the politicians, that is, the President and the Senate. The history of these officers is the history of political appointments—some justifiable, others not. (2) Over the rest of the "officers" Congress may exercise power, and it may operate by giving authority to the President, with the advice and consent of the Senate, the President alone, the heads of departments, and the courts of law. On this basis Congress had committed the bulk of the high administrative and technical offices to the mercies of the President and the Senate.<sup>12</sup> It committed to the same system the postmasters, the collectors of customs and internal revenues, registrars and receivers at land offices, district attorneys and marshals, officers of the Army and the Navy, and officials of the public health service and coast and geodetic survey—this is the bulk of contemporary

<sup>11</sup> Article II, Sect. 2, para. 2.

<sup>12</sup> Cf. Lewis Mayers, *The Federal Service* (New York, 1922), p. 33.

## TOWARD A SPOILS-FREE CIVIL SERVICE

spoils. It vested some power in heads of departments, and these, too, are liable to patronage, where Congress has not stated the mode of the appointment—which it has the perfect right to do.<sup>13</sup> Finally, after long years of administrative demoralization and with intense reluctance, Congress established an agency, the Civil Service Commission, with power to recruit, by merit, the officials which the President had the discretion to classify by executive order. This has given rise to the “merit” system for over 90 per cent of the whole of the federal service.

*Obstacles to Reform.* An intense struggle was needed to create the merit system, and the issue was complicated by these causes. First, the Congress was anxious to keep power out of the hands of the President and the heads of departments. To leave appointments solely to them was to give the executive the power to overcome the separation of powers (which was a dogma) by the use of patronage. Hence the chief preoccupation of Congress was rather to limit the removal power of the President than to increase his appointing power.

Next, by an unfortunate faith in the short tenure of offices, laws were passed establishing four-year terms of office for many official posts. This, the instrument of the theory of “rotation of office,” was an application to administrative office, of measures properly taken, to secure the dependence of responsible assemblies upon the people. By a series of laws of 1820, 1851, 1872, and 1894, tens of thousands of officials in the customs, land, postal, and immigration services were made appointable for four-year terms. All these officers had to seek reappointment, and face the possibility of not being reappointed, every four years. In these circumstances, even where the Civil Service Commission examined the officers (as in the case of the postmasters), the examination could rarely provide good officials owing to the insecurity of the situation. The four-year term was an encouragement to political favoritism. All classified

offices and many others established by statute are permanent.

### TOWARD A SPOILS-FREE CIVIL SERVICE

COMPARED with 1880 and the previous hundred years, a remarkable purification has taken place. Why and how?

*Impulses to Reform.* It seems that the exceptional irregularities in the Civil War period, due to the extension of government activity, had awakened attention to the problem. But the example of England in the preceding decade began to have its full force upon travelers and upon certain parliamentarians, like Thomas Allen Jenckes, Carl Schurz, George William Curtis, who were much above the average of their colleagues.

By 1872 civil service reform had forced its way into the party platforms, and in 1876, Hayes, the Republican candidate for President, and the favorite of the reformers, was elected President. His election was followed by the appointment of Carl Schurz as Secretary of the Interior, and the commissioning of Norman B. Eaton (afterward first Civil Service Commissioner) to write a history of the civil-service reform movement in Great Britain. The “political assessment” system came to be detested by officeholders and people and was the source of constant re-creation between the political parties, thus spreading the knowledge of abuses among the electorate. In 1876 Congress passed an act prohibiting the making or the payment of assessments among all servants or employees not appointed by the President and Senate. This and the executive order implementing it were little heeded. A Senate investigation committee of 1879<sup>14</sup> showed (a) that the assessments were raised on a regular system, “follow-up” letters being sent to defaulters, and (b) that the President had approved the circular asking for contributions. The practice of assessments continued in the election of 1882.<sup>15</sup> In 1881

<sup>14</sup> Report, 46th Congress, 1st and 2nd session, No. 427, p. 2.

<sup>15</sup> E.g., Thomas, *Return of the Democratic Party to Power in 1884*, p. 85.

He says: “Great political battles cannot be

<sup>13</sup> Cf. *U. S. v. Perkins* (1886), 116, U. S. 483.

the National League for Civil Service Reform had been established; and in several states small associations were already at work. A case was fought in the courts, which held that the law against "assessment" was constitutional, and that the offender, the New York State Republican committee chairman, was guilty. At about the same time fraudulent arrangements were made by the second Assistant Postmaster-General and various subordinates to increase the number of certain special postal services and increase the pay for existent ones—profits to be shared. The propaganda of the reformer frightened the parties into inclusion of reform on their platforms. The evils had been fully exposed in the House Committee's report of 1868.<sup>16</sup>

An attempt at improvement had already been made in 1871. A Congressional statute had authorized the President to prescribe such regulations for admission in the service "as may best promote the efficiency thereof," and ascertain the fitness of each candidate in respect to age, health, character, knowledge, and ability "for the branch of the service into which he seeks to enter," and for this purpose to "employ suitable persons to conduct such inquiries." The President also obtained power thereby to regulate the conduct of persons appointed to the civil service. However, Congress, having given the President this power, failed to provide money for its execution. The result was the concentration of the reformers upon a new and more comprehensive statute. Neither party wished to spoil its chances for the Presidential election of 1884: the Democrats were in sight of power, the Republicans were within an ace of losing

won in this way. This committee cannot hope to succeed in the pending struggle, if those most directly benefited by success are unwilling or neglect to aid in a substantial manner. We are on the skirmish line of 1884 . . . unless you think that our grand old party ought not to succeed help it now. . . It is hoped that by return mail you will send a voluntary contribution equal to 2 per cent. of your annual compensation, as a substantial proof of your earnest desire for the success of the Republican party this fall . . ."

<sup>16</sup> Cf. 40th Congress, 2nd session, ii, No. 47.

it. For the few all-important votes an important, if unpleasant, concession had to be made. The reforming Congressmen, "exceedingly holy and wise," as an opponent called them, pressed. In 1883 the Senate, led by Pendleton of Ohio, and acting upon a bill drafted by Eaton (the historian of British civil service reform and the New York civil service), after a long and mainly scoffing debate<sup>17</sup> passed the bill by 38 to 5, with 33 members absent, while in the House 155 were in favor, 47 against, and 87 abstained. In the Senate, the majority was composed of 25 Republicans and 13 Democrats; in the House, of 102 Republicans and 49 Democrats. In the Senate the opposition were Democratic votes, the absentees mixed; in the House opposition and abstainers were well mixed among the parties.

*The Civil Service Act.* The Civil Service Act of 1883 is the legal foundation of the system of recruiting the officials to the non-Presidential-Senatorial positions, and of their various rights and duties, especially political. What are its main features?<sup>18</sup>

(1) It gave the President the power to appoint by and with the advice and consent of the Senate, three persons, not more than two of them adherents of the same party, as civil service commissioners, to constitute the United States Civil Service Commission. They are removable by the President alone.

(2) Their duty is to aid the President, as he may request, to prepare suitable rules to carry the Act into effect. These rules once promulgated, it is the duty of

<sup>17</sup> Cf. Senate Report, 47th Congress 1st session, No. 576; *Congressional Record*, 47th Congress 2nd session, 200-67.

<sup>18</sup> Cf. an act to improve and regulate the civil service of the United States (January 16, 1883, 22 Stat. 403). For the law and regulations and executive orders relating to the service, see any annual report of the U. S. Civil Service Commission (U. S. Government Printing Office), Appendix; and especially *Civil Service Acts and Rules, Statutes, Executive Orders and Regulations, with Notes and Legal Decisions*, as amended from time to time (Superintendent of Documents).

all officers of the United States wherever the rules pertain to help them into effect.

(3) These rules shall provide for the following, "as nearly as the conditions of good administration will warrant." (a) Open competitive examinations must be held to test the fitness of applicants for the public service now classified or to be classified. (b) The examinations are to be practical in character and to relate to fitness to discharge the duties of the service into which the applicants seek to be appointed. (c) The offices of each class are to be filled by those graded highest at the examinations. (d) The offices in Washington are to be apportioned among the various states and territories on the basis of their population. (e) A period of probation precedes absolute appointment. (f) Necessary exceptions from the rules are to be stated in the rules, and reasons to be given in the annual reports of the Commission. (g) The Commission is to conduct the examinations, make an annual report to the President for transmission to Congress, giving, among other things, suggestions for the more effectual accomplishment of the Act.

(4) Excluded from the effect of the Act are laborers and workmen and persons nominated for confirmation by the Senate.

To whom, now, did appointment by merit apply? It applied to the clerical positions already "classified" by an Act of 1853,<sup>19</sup> and a list of positions similar to these. Then, the act provided for the progressive classification of other servants by the initiative of the President and the help of the heads of departments.

The dynamic power was thus given to the President, and the history of "classification," or additions to the service recruited by the Civil Service Commission, is since then a history of the courage and vacillations of the Presidents,<sup>20</sup> the exigencies of party warfare and the craven fears of Congressmen, and the uninterrupted toil of the various Civil Service Reform Leagues.

This is enormous progress. Let us recapitulate the main features of the American system:

(1) Many important administrative and technical posts are still subject to political patronage.

(2) There are many minor positions in Washington and the "field" subject to political patronage.

(3) Some of the first category are appointed and maintained on principles of efficiency; some in the second category (e.g., Presidentially-appointed postmasters, and laborers) are examined by the Commission, but in these cases three candidates are presented for each nomination by the President, confirmable by the Senate.

(4) The great bulk of the service, professional, scientific, and clerical, is appointed after open competitive examination by the Civil Service Commission. However, by the rules made by the President under the Act, the Civil Service, "where the conditions of good administration warrant," excepts certain positions from competitive examinations and gives instead noncompetitive examinations. There are exceptions possible (by Rule II, Section 3) from examination altogether, amounting to several hundred in the central departments alone—without reasonable ground, having regard to their usual nature. There are certain exceptions from civil service appointment by statute. There are certain exceptions possible by Rule II, Section 10, where people may be appointed without examination when certain specific vacancies occur. This has made possible the appointments of special experts. Further, executive orders make special exceptions of experts, but mainly of widows of former civil servants, "for charity," about twenty to thirty a year.

The United States is not yet adequately strong in its higher administrative service, but it has other strengths: its attention to the theory and practice of classification; its experiments in tests for manipulative and simple executive officers; its contribution to the theory of "efficiency ratings"; its concern for postentry training;

<sup>19</sup> Cf. Mayer, *op. cit.*, pp. 41 and 47.

<sup>20</sup> W. D. Foulke, *Fighting the Spoilsman* (New York, 1919).

## THE UNITED STATES CIVIL SERVICE

and its recently announced intention to utilize the various departments as recruiting agencies.

*Spoils Nearly Ended.* In the fiscal year ending June, 1930, the federal authority employed in the executive civil service<sup>21</sup> about 609,000 officials. Of these, 462,000 were subject to competitive examination on all the rules of the Civil Service Commission.<sup>22</sup> The rest, some 140,000, or nearly 25 per cent of the total, were appointed by other persons, it may be upon technically good rules of efficiency, it may be entirely out of political considerations. They were the offices in the gift of the politicians from the President downward, by the President with confirmation of the Senate, or by heads of departments, but some were subjected by Presidential decree to objective tests of merit.

How were the 140,000 constituted? The largest quota, comprising perhaps 98 per cent, consisted of post office employees<sup>23</sup> and artisans and unskilled laborers, and subordinate and temporary custodial and manipulative officials. The others, or some 3000 offices, consisted of the high directive and technical headships of the departments and ancillary bureaus in Washington and in the "field service." Many of the 98 per cent were subject to no objective tests of merit by any agency; and only a small proportion of the 3000 offices represented by the 2 per cent were anything but political "spoils," and it was this 2 per cent which coincided with the English administrative grade in its highest reaches, going down in some cases to what English students would define as the higher reaches of the executive class. Then, out of the 98 per cent, the postmasters of the first, second, and third class, numbering about 15,000, were examined by the Civil Service Commission, which then presented three candidates for

each post from whom the President and the Senate appointed one. In the 98 per cent, there were also some 2000 customs and revenue officers who were subject to no rules of appointment but were Presidential-Senatorial nominees.

In the years since 1930, widespread and beneficial reforms have been carried out. In June, 1936, the numbers of federal civil servants had risen to some 824,259 under the impulse of new functions to repair past shortcomings in social and economic reform and to palliate the miseries of depression. In that year some 60 per cent only were subject to merit examination. The President's Committee on Administrative Management recommended the extension of full civil service conditions "upward, outward, and downward." The President responded with the ordering of full civil service status for all postmasters in June, 1938. Then, the Ramspeck Act of November 20, 1940, gave to the President the authority to include all offices; but it directed the exclusion from civil service only of TVA, WPA, federally owned corporations, and as the President should decide, the positions in the appointing power of President and Senate, and the assistant United States district attorneys. The Executive Orders applying the President's power in this regard (Nos. 8743, 9004, and others) brought into civil service practically all positions not then covered by it. There are some exceptions<sup>24</sup>—they number perhaps 40,000 or 50,000; the estimate is difficult to make—for offices of a religious, or confidential, or safety or police and detective kind, and some temporary kinds of expert assistance, all United States attorneys and marshals, collectors of revenues and customs. But broadly speaking, the federal service was practically a system removed from spoils and was applying objective tests of merit everywhere, ex-

<sup>21</sup> This includes, of course, servants of the legislature and the courts.

<sup>22</sup> Therefore called the "classified" civil service.

<sup>23</sup> About 100,000 employees and postmasters of the 1, 2, and 3 class and "star routes." Fourth-class postmasters were put into the classified service many years ago.

<sup>24</sup> There are 330,325 excepted positions. Of these, 200,000 are outside the Continental United States in occupied areas. Of the rest, large groups like the TVA., the FBI., and the Foreign Service have their own merit system. Those who are still patronage may be judged from the lists on pp. 43-55 of the U. S. Civil Service Commission, *Annual Report* (1947).

## THE CONTEMPORARY SITUATION IN THE HIGHER CIVIL SERVICE

cept in the highest "policy-determining" or political secretaryships and assistant secretaryships. The federal service rose to a size of 3,000,000 during the war, when, of course, the posts were special war appointments and did not confer civil service status. The tide recedes: and it is expected that the federal service will regularly employ some 1,500,000 to 2,000,000 employees. All of these with the exception of top political positions have come under civil service tests, though the Senate still has a hand in the appointment of first-, second-, and third-class postmasters, numbering some 15,000, because the Senators help to nominate for the examination.

The attainment of almost full civil service, sixty years after the passage of the Pendleton Act, may not seem a remarkable feat in the complete span of a man's life. However, the achievement must be measured against all the grim and insidious opposition to it by politicians of all parties. The nastiest type of public men have set their hands again and again to prevent or mitigate or ruin the civil service system. The reform has been accomplished in the midst of a great industrial revolution, and convulsions of the public conscience. It cannot even be said that the battle is won forever since attacks continue, and one or the other party may one day debauch the service again for the sake of its electoral benefit.

### THE CONTEMPORARY SITUATION IN THE HIGHER CIVIL SERVICE

In the United States, then, at the present time, most technical posts, but not all, are filled by those who have been selected by the Civil Service Commission. Many of the civil servants' posts equivalent to the British or European officials at the very top, and between the minister downwards to the executive class in the non-technical and merely administrative posts are political appointments. But this does not connote the entire absence of civil servants equivalent to the English, French, and German administrative grades appointed by merit. Only, the

Americans have classified their servants in more technical terms and prescribe technical examinations for them. Below the rank of bureau chief, which is headship of a principal branch of a department, come the clerks of various ranks, and these are appointed by merit down as far as the unskilled laborer positions, an occupation exempted from the normal civil service tests but not from special tests which have in fact been established.

*Absence of Satisfactory Top Management.* Yet almost all offices down to and including some of the bureau chiefs are political appointments. (The Hoover Commission Report on "Departmental Management," page 9, shows that 32 out of 73 bureau chiefs are still not under civil service.) What is this political stratum? It includes the heads of departments or secretaries who are cabinet ministers, and properly, as in Europe, political appointments. Then, according to European practice, there would be a political undersecretary. In the United States instead there are occasional political undersecretaries, but always one or more political assistant secretaries for each department.

Next, downwards after the politicians, we should expect to find, as in British or German practice, the Permanent Secretary, a professional appointment by promotion after long service, at the head of a large staff of professional civil servants going down through all ranks in the capital and the provinces to the industrial staffs. But not so in the United States. In the first place, there is no counterpart to the Permanent Secretary and his immediate deputy with authority over a whole department. The next officers below the little group of political appointees are chiefs of various bureaus either independent of the departments (as the Government Printing Office) or subdivisions, rather independent, of the department. These are directed not by a Permanent Secretary, with a staff of assistant secretaries and principals as in England, but by the political assistant secretaries above, and then by the bureau chiefs. In other

## THE UNITED STATES CIVIL SERVICE

words, there is no career officer who links together and directs all the bureau chiefs in a whole department. Where the British have a well-forged career link between the civil service levels from the highest point downwards and the politicians at the pinnacle of authority, the United States administration has only a political hiatus or a meddler and some assistant meddlers.

Five factors obstruct America's way to the provision of satisfactory top management in her administration. (1) The first is an undue attachment to "technical" tests—a product still of a society and economy in the making and on the make. The Civil Service Act of 1883 is still the authority for "technical" tests. It must be remembered, also, that recruitment is not truly competitive: it is qualifying, and those that get the qualifying marks are held on the register for a length of time until a job turns up. Also, the "rule of three" prevailed: that is, the Civil Service Commission certifies three successful candidates for each post to the head of the department, from which he chooses one. The severity is lacking. (2) Politicians do not trust any top administrators but their own party friends—at least, as yet, not enough for long enough. (3) There prevails a partly genuine, partly propaganda idea that an administrative class is a social "class"—which is nonsense. (4) It is said that Congressmen like to make contact directly with bureau chiefs in immediate charge of operations, and not go downwards through one top administrative chief. (5) The creed still conspicuously ferments that anyone from anywhere can do anything, or should be allowed to try.

*Political Chiefs and the Administrative Chasm.* Accordingly, in the American administrative departments, the political secretaries and assistant secretaries occupy the place but hardly perform the functions of the Permanent (that is, the career) Secretary and his immediate career assistants in the British system. The American system is maintained by a number of arguments: some sound, others specious. It is sound to have political chiefs

appointable and removable by the victorious party in the election: that is proper democracy. It is sound, though rather expensive, to have many assistant secretaries. It is not sound to give to those assistant secretaries the responsibilities that are administrative at the same time as they hold those that are policy-determining and politically punishable. For the road to the latter positions is not the road to administrative competence. If the assistant secretaries must be appointed, it is unsound not to appoint additional men to act as permanent career departmental chiefs in whom all the operative authority and work of the department shall focus. From these permanent departmental chiefs, upward, and suitably advised by the bureau chiefs, there should ascend departmental advice on policy and day-by-day law-fulfillment reports to the political chiefs above. The unfortunate crux of American administrative difficulties lies in the unfilled chasm between the political chiefs and the bureau chiefs, and with it the fact that the President "needs help" which the system still does not provide, and never can until the day of drastic remedies.

I compute that at the top of the United States civil service there are some 9000 professional and scientific and 7000 clerical, administrative, and fiscal posts above the salary of \$7000. This is 16,000—perhaps a few more should be added to the top administrative group, organized as such; it is disintegrated. (The Hoover Commission, in "Departmental Management," page 60, making a *different* computation of "top management staff," totals 16,000 also!) A magistral pioneer study by Professors Arthur Macmahon and John D. Millett has revealed to us the true state of the national administration at its top levels.<sup>25</sup>

Vigor and freshness of mind have been extolled by many as the contribution which the political group of assistant secretaries may be expected to bring to the conduct of administration. What, in fact,

<sup>25</sup> A. W. Macmahon and J. D. Millett, *Federal Administrators* (New York, 1939).

do they bring? They are appointed on practically pure political (that is, campaign) considerations, nominated by the President, to be confirmed by the Senate. They are sometimes appointed before the secretary, the head of the department, is himself appointed, so that he comes into office, not quite knowing what his policy is yet to be, to find a *damnosa hereditas*, infantile in novelty, already on his doorstep. No party principle or platform unites all the assistants; none the secretaries: none the secretaries and their assistants. Loyalty is to a particle of the platform. Hence they are all specialists as to loyalties and their ability. Departmentally, secretaries and assistants have often been at terrible odds with each other as regards policy, ability, and personality. Their typical periods of office are two, or three, or four years: scant time, indeed, to master their departmental responsibilities or to understand their authority or to acquaint themselves with talent or to design instruments of cooperation. Instead, there is a fitful feverishness of activity, or impassivity and fecklessness. Such a means of appointing the highest directors of departmental administration gives little encouragement to interdepartmental cooperation. A majority of them are lawyers; some are businessmen and journalists, others teachers and owner-farmers; most of them have been to college: but what, administratively speaking, what merits do these unspecific qualifications provide? These haphazardly selected men, put like cuckoos into the position which could be occupied by a group of civil service career administrative statesmen, rarely include career men—rarely include experts in a given field of administration. Civil servants refuse to be promoted to such positions because they would be exchanging security for insecurity of tenure.

Owing to the operation of political parties in the United States and the influence of sectional and special pressures, the political chiefs are at best second-rate. While some are appointed at the age of forty to fifty, when administrative vigor and eagerness is likely to have given way

to steady wisdom (if the wisdom was already in reserve), most of them are actually appointed at the age of fifty to sixty. Where then is the freshness of mind?

Thus, they cannot give administrative direction and counsel as their permanent (and younger) British counterparts can. They are faded second-raters (in a composite picture of course). They cannot freshen the tone of the enormous agencies over which they confusedly preside, or assure a more virile responsibility on the part of the mass of their subordinates. As the study by Macmahon and Millett concludes: assistant secretaries are "idling cogs in the national machinery."<sup>26</sup>

*Bureau Chiefs as Administrative Bridges.* This situation puts a tremendous burden for the good of the state on the bureau chiefs. They are hardly able to bear it; but they are the best that American practice now affords as coordinators of other peoples' work, leaders of large sections of administration, links between their own branches and those of other similarly placed chiefs, and advisers upward on the development of the laws, regulations, and policy.

Who are they? Macmahon studied only 62; Hoover, 73. But there are, at a guess, as no one can tell exactly, perhaps 1200 officials at bureau-chief level, whatever the title. Macmahon says they are "the key figures in national administration." Of the 62, 27 were full civil service officials, and 3 appointed by special terms equivalent to putting them into that career-tenure category. Another 14 had been promoted from inside the civil service, while 4 had virtually been promoted from civil service, state, or local administration. Thus, altogether 48 might be regarded as fully or practically career men. Of the 14 remaining, 8 had been recruited from outside, from work of a related nature, and 6 were purely political appointees.

They are nevertheless not men of assured and very long service. Some of the posts which are unprotected are lost at a change in the Presidency. Most others

<sup>26</sup> *Ibid.*, p. 302.

arrive at their status at about the age of forty-eight when retirement is not so very far off; while others resign to take jobs which may better provide for their later years. The jobs are held for something like eight to sixteen years and over; these stretches of time are substantial, and are remarkably so compared with the transient assistant secretaries. Men in comparable positions in the British civil service get there by about the age of forty; so that they have almost always twenty years of the highest responsibility before them, though not always in the same department. (My comparison is with a rank somewhere between that of principal and assistant secretary in the British system—admittedly a difficult comparison.)

These bureau chiefs are technicians or specialists. They are not an "administrative class" or "civil administrators" as in France since 1946. They have entered a department by an examination which required technical proficiency in the specific services of a grade of a branch of a special department. Most of them had a higher education: and more than half of them took postgraduate studies, many of which were specialist. It is understood that the way to promotion is to a large degree paved with postgraduate studies. But usually, American undergraduate education is not yet of the intellectual standard of British or European—there are fine exceptions, of course.

Thus, as the study demonstrates: "Bureau chiefs are critical links in the managerial chain. Their essential permanence is a prerequisite of command through the hierarchy as a whole."<sup>27</sup>

*Proposed Reforms.* What is the conclusion? The United States lacks administrative advisership or statesmanship at the highest level. Some bureau chiefs have fine gifts of general counsel, comprehension, and managerial ability. But the bureaus are chopped pieces of what should be some system (I do not say "a" system). The pieces are too finely chopped. How can they be put together to give the President and the secretaries

and the Congress the panoramic counsel they need? In the British system an administrative class has been the chosen instrument. It has some disadvantages: it requires that the exceptions, those who cannot rise to the height of responsibility and service, shall be left unpromoted; and it may suffer from the loss of the valuable assets that a technician with administrative gifts could contribute. But the only present remedy in the United States administration boils down to looking for the exceptions among the specialists and technicians, and culling them untutored, or giving them tuition, in administrative responsibilities and then seeing that they are transferred into the right places. If the reader will study the ingenious devices proposed by the authors of the Macmahon and Millett study for overcoming the infirmities in the system which they were at the most honorable pains to reveal, it will be seen that the exertions are so much more considerable than the promise of success that more serious changes are necessary. Something like the British system is necessary: I do not say identical. Its basic tenets, I think, are unavoidable; especially so where state activity involves the management and marshaling of the abilities of one and a half million civil servants, in a framework of political leadership in which the executive has an enforced separation—settlement with the Congress, and where the two may be estranged, even bitterly hostile, in cunning ways, because a different party is the incumbent of each. Man and wife being estranged, perhaps the children might benefit if trusty housekeepers managed the home—under direction, of course.

Apart from the internal meliorative suggestions of the Macmahon and Millett study, two ways have been proposed: (1) the appointment of administrative secretaries, and (2) the gradual building up of a class of administrative technicians.

(1) In some departments, though very few, there has been established—as a simple result of intradepartmental experience and initiative, and the empirical discovery of someone who merited the posi-

<sup>27</sup> *Ibid.*, p. 467.

tion—the job of administrative assistant or administrative secretary. This position is close to the secretary, and provides for the services of general managerial and advisory duties. It could be universally installed. If it were, with a group of cadets to aid and follow their chief—and if there were a suitable avenue of entry into the group, with careful selection of the candidates whether from inside or outside the service, recruited in the hope of a regular career—it would provide the administrative body we think is indispensable to the government.

The Hoover Commission proposed that, under the department chief, the under secretary, and one or more assistant secretaries, all political appointments, there should be generally in addition, "an administrative assistant secretary who might be appointed solely for administrative duties of a housekeeping and management nature and who would give continuity in top management. They and certain other officials, as in the Treasury Department, where length of tenure makes appointment from the career service preferable, should be appointed from that service."<sup>28</sup> This is a truly ominous abdication! They have left policy to the bureau chiefs; they have assigned major policy where it has always been, to the politically appointed chief and his assistants; but all they want the "administrative assistant secretary" for is "housekeeping and management" duties, and continuity in top management! This is a lamentable misunderstanding of what is needed: beneath the political chiefs, a permanent, career, brains trust, to be responsible for advising on long-term policy, for expert policy assistance to the political chiefs, to be their friendly and subservient critics, as well as to see that the whole department is a smoothly running concern in its personnel, salary, disciplinary, cooperative, research, and fulfillment and enforcement responsibilities. What is needed is not merely a broom but a brain.

(2) Something of the nature of an alternative has been tried since 1934. Some American students of administration, above all Professor Leonard D. White of the University of Chicago, had for long been impressed with the value of an administrative stratum which would comprise not merely technicians and special experts, but men of general education, comprehension, and high intellectual ability.<sup>29</sup> He was influential as adviser and later as member of the Civil Service Commission. The Commission set up a Junior Civil Service Examiners' Group. The intention was to provide an entry into administrative situations. The minimum educational qualification was a bachelor's degree from an institution of recognized standing. Some 15,000 applicants between 1934 and 1941 took the examination (itself testimony to an enhanced interest in public service as a career); of these 7000 passed, while over 2000 in due course found positions in various types of work in the federal service. Nearly 2500 more entered this group from other examinations.

The examination was subsequently consolidated with one for junior professional assistant, still preserving the great width of its general appeal in the range of examination options. The scope was narrowed, however, by the requirement of special work in economics, political science, and public administration, so that some potential candidates were deterred from entry. Ten years' experience attests some moderate success of this mode of recruitment, as a few of the ablest of the rising civil servants come from this source. After World War II, the experiment continues; junior administrative technician, is, characteristically in the American scene, the title of the posts.

Yet how far from answering the real problem this innovation is may be seen from a consideration of (a) the posts that fall within the title of junior professional assistant, and (b) the qualifications. (a) The examination recruits administrative

<sup>28</sup> "General Management of the Executive Branch," pp. 38-39.

<sup>29</sup> Cf. his *Government Career Service* (Chicago, 1936).

technicians, archeologists, astronomers, bacteriologists, chemists, economists, engineers, geographers, legal assistants, librarians, mathematicians, metallurgists, patent examiners, physicists, psychologists, social science analysts, and statisticians. Already, then, the importance of the reform must be reduced to the administrative technicians, economists, social science analysts and statisticians—for these are the only groups in the list who are more especially fitted by education and purpose than the rest, who are chiefly the products of education in the natural sciences. The economists and the statisticians must be regarded also with some doubt, because their education is normally extremely narrow and specialized, even if it goes deep. It must be remembered that we exclude from the discussion natural ability to administer: for that is a factor common to all civil services and methods of recruitment, while we are here trying to isolate the effect of recruitment and educational requirements.

(b) When, again, we turn to the qualifications for entrance, we note two factors markedly different from those of Britain and France and from the classic system of Germany to 1933. First, entrance is possible between the ages of 18 to 35: much younger and very much older than in the other services. The problem of recruiting at too advanced an age has already been ventilated.<sup>30</sup> Second, the prerequisite for entrance to the position of junior administrative technician is *either* a full four-year course at a college or university leading to a bachelor's degree with at least 24 semester hours in public administration, business administration, political science, or industrial management or industrial engineering, with credit also for statistics, accounting, economics, psychology, and sociology to a certain limit—or at least three years of progressively responsible experience in general office work, one year of which must have been in administrative duties of the kind of work described for these recruits—or a combination of experience and education

at the rate of one academic year of education for nine months of experience. What then is the description of the work? This:<sup>31</sup>

*Administrative Technicians will perform or assist in performing responsible work in one or more specialized fields of administration. The duties include assisting in organizational and procedural studies; preparing and reviewing budget estimates; doing recruitment, placement, position classification, and related personnel work; and performing other administrative duties.*

When this is compared with the descriptions of the work of the higher civil service classes in Britain, France and pre-1933 Germany, the paltry, inadequate nature of American administrative reform along this particular road becomes all too plain.

*The Problem Not Answered.* The problem of inadequacy in the higher civil service is not solved, for two reasons.

(1) In the first place, no recognition has yet been given to the principle of an administrative class or administrative "brains trust." As yet it is not accepted that a career of administrator should be set up, devoted to administration, in the sense given to that word in the higher civil services of Britain and France.<sup>32</sup> The classification of the federal service provides no place for such a career, leading up to administrative assistant or secretary—as suggested by reformers but not yet installed. Most of those recruited by the examination just described have not undertaken the general work of administration—which means, in our context, the highest tasks of advice of ends and means in policy—but specialist services in personnel work, financial controls emanating from the Bureau of the Budget, and technical supervision and assistance in administrative organization and methods. The function of *thought*, comprehensive and synoptic, supplied by a widespread career group—*thought* covering grand sections of the whole administrative apparatus,

<sup>31</sup> Cf. Announcement No. 75, October, 1947, U. S. Civil Service Commission.

<sup>32</sup> See especially pp. 786 and 822 above.

<sup>30</sup> Cf. pp. 786 and 803 above.

and sweeping its gaze over the whole of the Government from a lofty plane, unencumbered by administrative and clerical triviality—is lacking.

(2) The examinations show triviality also—no width, no philosophic wrestling—they are back into the routine of their subjects.<sup>33</sup> As a very enlightened examinee in this same entrance examination has said:<sup>34</sup>

It must be recorded, however, that the examination does not reflect the outlook of those who hold with Felix Frankfurter that our institutions of higher learning must be training schools for public service, not through utilitarian courses, but by the whole sweep of their culture and discipline.

One of the merits of British and French civil service recruitment is the very close correspondence between the educational system and the public service. This is made possible, fruitfully, by the coherence of the educational system, the consequence partly of a long history of culture and partly of the relative smallness of the territory served. But a deeper cause emerges as we reflect on these truths: both public services and educational systems are suffused with a like sense of standards of social conscience and mind. The United States is too young and otherwise busy as yet to have developed these. The time is fast approaching when America will have become a society, which is an aggregation of human beings living in each other's company on the basis of spiritual principle. As it is, the civil service tends to be merely one other kind of job.

In spite of much thought and many inquiries and reports every other year, and in spite of many audible claims that the daylight was about to break, in spite of millions of dollars spent in research on the subject by the learned foundations,

the Hoover Commission could not but reveal great disappointment with the state of the public services. "Personnel Management," its chief contribution to the problems says,<sup>35</sup> "Not enough time and effort are being spent on recruiting our best young men and women for junior professional, scientific, technical, and administrative posts." It observes<sup>36</sup> that, of some two million persons in the federal service, no less than a half a million persons a year must be recruited "to fill vacancies caused by turn-over," admittedly "an indication of the existence of low morale." Yet most of the Commission's report is concerned with salaries and minor personnel practices and gadgets. Only Professor J. K. Pollock, who entered his own report<sup>37</sup> exhibits the glimmer of an insight into the problem of getting and properly placing in important policy positions "superior native talent."

In the light of this mole's-eye view of what service the Republic needs, it makes one almost grudge to acknowledge the possibility of the wisdom of the Commission's recommendation, that, under the authority of the Civil Service Commission, each department should assume responsibility for developing its own recruitment program, in order to meet its own special requirements. But, even that seems to re-enthroned the special expert, and to threaten the recruitment of departmental hierarchies, who, at the brains-trust level, will find cooperation difficult, since they will have remained in their own departments for many years after having come in with special talents for and special loyalties to it rather than to the federal service as a whole. It is another step away from coordination and a single career service with all the possibilities of cross-fertilization by transfers, within a single service framework and devotion. Patriots must be sick at heart to realize that almost all that has come out of the Commission, at much cost, and with so many years of administrative

<sup>33</sup> Cf. Princeton bicentennial volume, J. McLean (ed.), *Universities and the Public Service* (1949); cf. sample papers, obtainable from the British and United States Civil Service Commission. Cf. also V. B. Zimmerman and Dwight Waldo, "A Worm's Eye-View," *Public Administration Review*, Winter, 1942.

<sup>37</sup> Page 47 ff.

## THE UNITED STATES CIVIL SERVICE

studies behind it, is in Professor Pollock's words, "a report inclined to envisage the problem of building a career system entirely in terms of higher pay, promotions, and transfers."<sup>38</sup>

*Postentry Training.* The theory that training after entry into the public service was necessary to ensure the full development of the latent talents of each entrant, and to supplement a program of promotions based on the discovery of a gift for administration, is an especially American idea: more contributions have been made to this subject in the United States than in any other country. Indeed, the British innovations of the postwar era are very much the direct adoption of American ideas.

Several American departments at the federal level have for a long time instituted public administration courses of wide scope for their officials and for others that like to attend. The school in the Department of Agriculture is especially well known. On June 24, 1938, an executive order required the Civil Service Commission to establish practical training courses for the civil service; this in co-operation with the departments and the Office of Education. The Commission was empowered to give credit in promotions and transfer tests for attendance at such courses. The Commission produced an interesting policy entitled "The United States Civil Service Commission's Part in Federal Training" (May 12, 1939). The Congress did not, however, supply the necessary funds. Nevertheless, the position of coordinator and director of training was filled; since then the departmental efforts have been encouraged, and the Commission has set up a school for the training of those who in their departmental or field work have shown aptitude for ascension to top management. The personnel officers of the various departments are the talent scouts as well as the immediate supervisors.

Each year the personnel officers of the various departments nominate several promising officials for further training.

The Civil Service Commission chooses some thirty from among these and then, on its own premises, gives them three months' training in administration. It is, of course, not a general education, but highly specialized. Nevertheless, it is important as one of the apertures through which a talent for government on a high level may be given its opportunity of service. It may be that some of the talent which is available will be thus discovered. But, necessarily, it is bound to depend on departmental altruism: and being departmental, there is no all-seeing eye to spot the men wherever they may be. An alternative method is to spot all or very many of the best brains of the school generations together at one open competitive test, as in the British and French systems of entrance to the administrative class.

In the study by Macmahon and Millett to which reference has been made, emphasis is laid upon the fact that the bureau chiefs came from and received their graduate education at colleges of wide geographical dispersion. This was praised by the writers. Their general view coincides with that of the present author's that the diversity of training, especially in the social sciences, is a good to be retained and not restricted.

### TENTATIVE SUMMARY

THE condition of the United States civil service is not a desirable one, and it has both political and administrative disadvantages. We have already dealt with the political defects of the system. The administrative disadvantages are plain: many incapable of the function they ought to fulfill are appointed. The "tone" and direction of departments and bureaus are subject to frequent change. The casual incumbent is not really interested in the fate of the subordinates, while some subordinates not only suffer from insuperable political obstruction to promotion, but suspect the political forces even more than they deserve. Incentive to technical excellence is reduced. The turnover rate is

<sup>38</sup> Page 55.

## TENTATIVE SUMMARY

about 2.9 per cent each month. "Of acute concern to federal officials generally, "says the Hoover Commission,<sup>39</sup> "is the continuous exodus of executives and key personnel from upper bracket positions." One half of nearly seven hundred of such former officials left owing, to low salaries and lack of opportunity for advancement, compared with private employment. Where, indeed, are the top "brains trust" positions in the administrative ranks? They have never been created.

If professional administration is lacking at the top, who conducts the work year in year out? Probably more falls upon the chiefs of divisions, chief clerks, and officers in charge than in other governments: that is, upon the top men in the professional and scientific and clerical-administrative-fiscal posts, let us say, the 8000 of the former and 4000 of the latter earning

<sup>39</sup> Appendix A, page 8.

salaries of over \$7000 a year. Now it is a truth borne out by the general experience that in the grades below those which we have consistently called the administrative, the nature of the entry test, and therefore of the education implied, becomes technical in the sense that it requires either special knowledge of office routine, computation, etc., or knowledge of the law and practice of the particular services of the department. Thus the American system, by keeping the highest offices in politics, leaves only the routine ones in the service (of course, excluding "technical," "scientific," "professional" occupations), and has divided administrative leadership generally speaking between (a) politicians who are amateurs and soon pass from the field, (b) technicians, and (c) subordinate clerks. It is far from adequate to the needs of contemporary America.

## *Problems Which Arise After Recruitment*

HUNDREDS of thousands of persons have entered the public service. Their function gives rise to a number of difficult problems springing from the nature of that peculiar employer, the public, and that rarity which is growing so much more common, the public employees: The public demands efficiency, at the least possible cost. The employees desire conditions of employment which they define as "fair." The problems are not dissimilar to those raised in modern private industry; and, of course, there are gradations of private and public enterprise, from the pure types of each, to those which approach the identity of the other. But, we are already aware, and shall become increasingly so, that the public services have special characteristics. This will be emphatically noticed as we traverse the contest of the demand for low-cost efficiency with the demand for fairness of treatment through the medium of the special problems of promotion, efficiency rating, classification, training and discipline, morale, loyalty, and civil and industrial rights.

### PROMOTION

It is the lower grades which are most interested in the arrangements for promotion. The upper grade has no obstacle external to itself to prevent its members from rising to the highest positions according to their capacity. But a social problem of serious proportions arises for those who have not been able to afford

the education necessary to enter the higher grade, but who develop capacities and the ambition and desire which often accompany them. For the civil service as a whole, the impossibility of a proper outlet for this capacity means the loss of efficiency by resignation of the best officials, and a dreadful deterioration of morale, which occurs not only among the members directly affected but among colleagues, and the sheer waste of talent which does not find its appropriate expression.

Now, all countries give a rise in pay within the grade occupied—a stipulated annual increment from a minimum to a maximum. The regulations require that these shall not be automatic, but shall be given or withheld as a reward for maintained efficiency or as a punishment for unsatisfactory work.<sup>1</sup> In the United States civil service, the "efficiency-rating" system is designed to secure that promotion, demotion, and retention in the service shall depend upon tested efficiency.<sup>2</sup> That is to say, the regulations especially direct that the increments shall not operate automatically; and certainly the tendency of thought in recent years—born of public concern about the growth of the civil services—has been to demand the punctilious execution of these regulations. But this is a rare procedure, rarer, at least,

<sup>1</sup> Order in Council, clauses 20 and 36. Cf. Macdonnell Commission, Fourth Report, Chap. VIII, p. 3 ff.

<sup>2</sup> 37 Stat. 413, Act of August 23, 1912, Sect. 4.

## PROMOTION

than the fluidity of rewards and punishments in private industry. We are at present more concerned with real promotion, that is, a rise to a higher grade.

*Arrangements for Promotion.* Opportunities for promotion are in all countries rare. In England before the reform of 1919 there were no formal processes for promotion, no written and comparable records of achievement, and the opportunities for promotion to a higher class, though existent, were few in proportion to the numbers in the lower grades. When the service was reclassified after the Reorganization Report of 1920, the opportunities were increased,<sup>3</sup> but the new clerical class (a compound of part of the intermediate, the second division, and part of the assistant clerks) still complained and complains of want of opportunity—though we have shown that substantial opportunity to rise existed for very able executive and clerical officials.<sup>4</sup>

What, in essence, is the source of the continual complaints of the lower classes regarding promotion? It has a threefold origin. First, the service classes and their complements are fixed at strictly the number necessary for the work to be done, and this excludes a flexibility of promotional chances according to the contemporary availability of talent. Then too, the civil servant with some years' experience is embittered to think that others will come into a class above him upon recruitment by examination for which he, perhaps, had not the economic means, and that he will have to be subordinate to such entrants and perhaps, for a time, help them to learn their departmental jobs. And finally, the tests often bring into the service people too good for their jobs—they are too young to know this, and later fret at the standstill imposed upon them by rigid classification.

This is a terrible problem and, if a time should come when most modern utilities are socialized, the system might one day be violently disrupted by the

restless spirits who seek advancement. Two things are clear: on the whole, the best economy lies in an increase of the posts open to promotion beyond the number dictated merely by the work to be done—simply to give the lower grades a continual feeling of opportunity; also, early promotion is necessary.<sup>5</sup>

In Germany there was no possibility at all of an intermediate-grade official's being promoted to the higher administrative class. At the most, an official of long standing and experience might be entrusted with work of the higher grade as a substitute for a short time, but he did not become one of that body either legally or socially. (Somewhat similarly, staff clerkships in the British civil service are one outlet for the clerical service.) The relationship between the higher and the subordinate grades was indeed one of the current jokes. Arrangements have been made for promotion within the lower grades. Very similar arrangements existed in France as in Germany to 1946, but the reforms we have discussed allow for substantial promotions to the higher positions. In the United States, political nominees and technically highly trained officials keep the top levels closed, but the generous age limits of entrance enable capable subordinates who continue their studies to advance by re-entry into higher positions.

Two questions are opened by these arrangements for promotion. The first is, how far do these opportunities respond to the available talent and the demand for promotion? The second is, what are the tests applied to select for promotion?

*Response to Desert and Need.* The first question is practically unanswerable, for there is no accurate gauge of the available talent or the extent to which mem-

<sup>3</sup> *Ibid.*, Chap. VIII.

<sup>4</sup> Royal Commission on the Civil Service, 1929, *Statement of Case*, Civil Service Clerical Association, and evidence of W. J. Brown, p. 70 ff.

<sup>5</sup> Cf. Macdonnell Commission, Fourth Report, p. 61: "It is, we think, indisputable that there is no worse training for the real duties of administration, which requires freshness of mind, individuality and judgment, than a long period of routine work, however faithfully performed; if, therefore, a man has sufficient superiority to fit him for administrative work, this fitness should be ascertained as early as possible in his career."

## PROBLEMS WHICH ARISE AFTER RECRUITMENT

bers of the upper grade ought to make room for those promoted. In this lack of accurate standard lies all the force and heartache of the lower grades; for they, like all of us, are apt to assess their personal capacity much more highly than the outsider will; and none of us will admit that he is not above the average. It is probably true that the clerical grades are too highly educated for the work they have to do, and that much of their training and ability is wasted. For their tests are pitched at a height needed for their most difficult work, and as soon as they have learned their routine, their everyday tasks make no increasing demands upon them. In private industry their talents would, in a number of cases—we must admit we cannot say exactly how many—respond to the stimulus of opportunities, self-made, self-sought opportunities. But in the civil service the opportunities cannot be made, and it is no use seeking them—for the opportunities depend upon the establishment, and the establishment depends upon legislative supplies, and these in turn depend upon policy and public opinion—all matters which no individual civil servant's enterprise can influence. The spirit of resentment in the lower grades is heightened by the fact that many are excluded from the full opportunities of the public service because they have not had the economic means to go through the training and pass the examinations set for the administrative class or the equivalents thereof. Perhaps these considerations account for the enormous turnover in the United States civil service, noticed in the previous chapter, especially as private employment opportunity is so much more abundant as compared with other countries.

*The Rating of Efficiency.* The second question offers an interesting insight into the nature of the state. The efficiency of the promotion system turns upon the means adopted to decide the relative merits of various public servants doing very much the same work. How close is the scrutiny, and how does it compare with the method of private industry? In private industry, in the businesses of small

and middle size, but definitely less and less as the firm grows bigger, there operates an intensity of selective process, unknown in public services. The prevailing dictum is that "nobody is in business for his health." The motive is gain, and the understanding is that all should try to "get on." There is a certain fatalism in the "get on" convention in that to have "got on" is accepted as a sign of desert; rather than a standard of desert being set up to determine whether a man ought to get on or not. A certain ruthlessness is exercised by both employers and employed. The employer wants the best person at the top and the worst at the bottom, and the immediate index of the rightness of choice is the profit-and-loss account. Further, the relationship between employer and managers, and often even with individual workers, is close enough for the employer to sum up personal qualities. Nor is there any sense of collegueship to prevent the expression of such a judgment. The tradition and spirit of private industry is all against it. The employer is accountable to no one: his own conscience, with its price registry of economic loss and gain, pity, sympathy, delight in power and efficiency, is the ultimate test. Or, rather, the private employer is accountable—to the consumers; but they have so far shown inordinately little interest in anything save cheapness, plenty, and quality.

Could not this system be introduced into the public services? To ask the question is to express its absurdity, impossibility, and to reveal the differences between public and private enterprise. To give an unlimited discretion into the hands of the higher officials, and to let loose ambition in the services, must ultimately cause the aggregate of salaries to rise or fall. The legislature would be presented with fluctuating estimates, and ought to examine the causes of fluctuation and attempt to relate the efficiency of the services to the increases or decreases. But that is impossible where the staff is so large and the services are not rendered to the public upon a price system. If the legislature did not control, but permitted

taxation to be raised to meet the increases without discrimination, I think we may take it that the salary bill would steadily rise. Or, suppose that it were forced down, there would be dissension among the staffs insupportable where the services to be rendered are as basic as they are said to be. The only egress from this difficulty, and, of course, it is the one taken by public services everywhere, is to lay down from time to time a set of conditions of employment which will operate fairly automatically: i.e., to limit the discretion of the superior officers and the opportunities and ambitions of the subordinates.

In private industry the variations of price, quantity, and quality cover all good and evil: in the public services the elements of good and evil in the conditions of employment largely predetermine quality and quantity. Accountability to the legislature and the public limits the number of permissible alternatives in employment policy. Further, in a "closed" service—that is, closed off from the chances of independent development by the individual of useful and money- or prestige-earning services—the sense of interpersonal equity tends to become very strong, so that considerations of justice and fairness assume an important place. Hence a special emphasis upon impartial tests of the right to promotion. If we are dependent upon our superiors and not upon our own capacity in relation to the outside world, then our superiors' judgment must be subjected to equitable rules.

*Seniority and Merit.* The satisfaction of the claims to advancement in the public service is therefore obliged to take place under certain forms and conditions. The tendency is always to fall back upon sheer seniority, for this method has much to commend it. It is automatic, and avoids the need for making invidious distinctions between one person and another, of placing the young over the old, of measuring the responsibility for the result of promotion.<sup>6</sup> (Its main difficulties

are those of legal definitions of seniority.) It is safe for the official who is charged with making promotions to say, "The man has been in the office *n* years!" It satisfies a sense of equality. To the older people, seniority is a defense against the newcomer; to the bulk of men and women who are not ready to run the risks of their avowed belief in themselves, it is equitable and undisturbing. Indeed, for very many situations seniority, up to a certain point, is advantageous—those situations are the simple routine clerical duties where long familiarity with office conditions and steady loyalty are the best indicia for those who are to direct several subordinates.

However, both the controlling authority of the civil service on behalf of the public<sup>7</sup> and the representative associations of the employees have agreed on the necessity for a more rational system—the former to secure efficient work, the latter to institute tests of merit which shall not depend upon the personal favor of a superior officer. Such tests are, in respect to merit, difficult to devise owing to the lack of an openly competitive spirit in the employees, the absence of free enterprise, and the inability exactly to relate the monetary value of each servant's work in the total produced by the service. And personal favor can only be minimized, not entirely abolished.

*Examinations for Promotion.* The most prevalent test of merit for promotion is now competitive records of past efficiency. However, in some of the United States

it is very much open to criticism: it suppresses emulation, renders useless zeal and intelligence in the exercise of the function. Its only advantage is negative, it stops favoritism inherent in a discretionary power. The violent reaction against favoritism and the intervention of the politicians in the career of the officials explains, without justifying, the place which is more and more given to promotion by seniority."

<sup>7</sup> Cf. *Begründung to Law on Salaries, Reichstagsdrucksache, 5656 (1927)*: "Naturally one must have the right to promote capable officials beyond the limits of their normal career. This is an incentive especially valuable for all and by its use extraordinarily unique powers are awakened and made useful for all of us."

<sup>6</sup> G. Jèze, *Revue du Droit Public* (Paris, 1912), p. 505: "Promotion by grade or class by senior-

federal departments examinations are given.<sup>8</sup> England, for the most part,<sup>9</sup> certainly considers these an interference with the ordinary official work of the candidate, and where the original test has been severe, the need for a supplementary test is an unnecessary imposition. In France it has been said that examinations for promotion are inappropriate, as officials must "less prove extensive knowledge than initiative, judgment, and tact,"<sup>10</sup> and the theory of the inexaminability of elderly candidates has been propounded.<sup>11</sup> In Germany examinations were required for the promotions in the lower grade, but from two thirds the way up the service this ceased, and informal reports were used. The superior official simply keeps a fairly detailed record in a portfolio: the record is called *personalakt*.

*France: Favoritism Abolished For Merit.*

A similar system was in existence, but less efficient, in Third Republic France, and more than a suspicion of favoritism clung to the system of seniority which strongly prevailed. In that country attempts were made for many years to bring about a change—to establish a legal proportion between the number of places to be attained by seniority and the number by merit—but none of them went beyond the stage of being referred to a Parliamentary commission. The projects also included arrangements whereby the promotions should be determined by a departmental council upon which the rank and file of the staff of the grade in question should have minority representation. To the present, promotions have been made according to the decrees regulating the departments, in so far as these decrees concern promotion, but some omitted to

regulate it. When the French use the term *avancement* they are concerned with movement upward in the same class, and also movement to higher grades. The former was more subject to seniority than the latter, and mainly gave the servant a higher salary. True promotion—that is, promotion to a higher grade—was mainly at the discretion of the head of the department, which meant in practice at the instigation of the superior officers. The law of 1912 attempted to secure a limitation of favoritism by providing for promotion lists, which were, in fact, generally drawn up each year, by the head of the department in council with some subordinates. Report forms covered education, character, conduct, accuracy, relations with superiors, and public and special aptitudes, and these were rated "bad" or "excellent" or given an arithmetical grade. But this only limited political favoritism; it did little more. This kind of limitation had a long history in France; and, indeed, the possibility of recourse to the *Conseil d'État* to maintain the principles of loyalty and sincerity to the spirit of the arrangement was (and still is) a firm safeguard against dishonest promotions.

In the Fourth Republic, civil servants have at last attained a thoroughly systematic status by the *Statut Général des Fonctionnaires*,<sup>12</sup> and this regulates promotion though the details must be supplied by a number of subsequent decrees. There are four great categories of civil servants: *A*, *B*, *C*, and *D*, separately recruited. For *C*, and *D*, which are lower in the hierarchy, competitive examination may open the way upwards into *A* and *B*, in which a small number of places are open for promotees, certainly not more than ten per cent. Various regulations provide for in-service training and access upwards. The promotion may occur by favorable placement on the regularly es-

<sup>11</sup> Cf. Project of June 1, 1920, which provided for promotion by (a) examination, (b) inscription on a table of promotion, (c) special decisions. It was arranged that in the promotions within the same class, one third at least were to be by seniority.

<sup>12</sup> *Loi*, No. 46-2294, October 19, 1946; and see *Journal Officiel*, April 3, 1947, for Instruction No. 1 on the application of the law; Decrees No. 47-1236, July 8, and Decree of July 24, 1947, on joint committees in *Journal Officiel* of those dates.

## PROMOTION

tablished lists of promotables, where the record of past service and currently exhibited ability and attainments decides the order of merit.

The promotion procedure within the categories (or *cadres*, as they are called) is based on annual reports of the officials.<sup>13</sup> These are now very much like the British civil service report forms, and have something of the character of the numerical statement of efficiency as established in the United States civil service efficiency record system, both described presently. It is highly significant that the French civil service has adopted these ideas, and they owe much to the fact that some officials of the *Conseil d'État* and others were, during the German occupation, with the French forces in America or Britain. This is shown also by the establishment of joint committees of higher officials and representatives of the lower ranks for each department, very much like the British civil service Whitley Councils to be described shortly. These review the promotion lists, and they may at the request of a civil servant consider the revision of the list in the interest of the complainant. The list, which grades officials in order of merit, is founded on "a careful examination of the professional value" of the officials. It must be shown to all officials three days after it is made up, so that a challenge may be made by interested parties. No lower-grade officials can pass on the promotions of higher grade.

Within the categories there are two kinds of promotion: by *échelon* and by grade. The first is within the grade: it occurs by seniority and efficiency record, and brings to the promotee an advance in salary. The average time an official of average ability may be expected to spend in each *échelon* is the basis of efficiency: in proportion as his efficiency record marks show he is above the average, the years he is to spend in the *échelon* are reduced, and he gets quicker promotion; in proportion as he does not come up to the average, he stays where he is or may be retired. When he is at the top of his

*échelon* he may get promotion to a higher grade, but here seniority will not be taken into account: it is at the pure discretion of the higher service to select by merit.

*Britain: Report Forms and Promotion Boards.* The most ambitious schemes are the British and American. In the British civil service the system revolves around the annual report form and the departmental promotion boards introduced in 1921. Posts with a salary of less than £700 a year are involved.

The report form repays consideration. It prescribes a number of human qualities: knowledge (*a*) of branch, and (*b*) of department, personality and force of character, judgment, power of taking responsibility, initiative, accuracy, address and tact, power of supervising staff, zeal, and official conduct. (It is an extraordinary thing that exactly ten qualities are enumerated—is it due to addiction to ten questions in examination papers or the Ten Commandments?) But the relative importance of these qualities varies with different posts, and the fitness of an officer for promotion depends upon his personal combination of those qualities requisite to the work in the vacant post. The further down the scale of routine work, for example, the more would knowledge of branch and accuracy count; where the official comes into contact with the public, address and tact would be "weighted"; in the management of other people, personality and force of character and power of supervising staff would stand out. These qualities are then judged by the certifying officer as above, below, or on the average of the grade. Exceptional qualities, good or bad, are included in the report. Until 1938, a judgment was then made whether the officer was (*a*) eminently fitted for special and early promotion, (*b*) fitted for promotion but not for exceptional promotion, or (*c*) not fitted for promotion at present. If an official fell under the third judgment or was below the average of the grade through faults entirely his own, it was part of the equity of the scheme that he should be informed of this.

<sup>13</sup> *Loi*, No. 46-2294, October 19, 1946, Title IV.

In 1938, as the result of a Whitley

## PROBLEMS WHICH ARISE AFTER RECRUITMENT

Council inquiry, the gradings were made rather more varied, thus: exceptionally well qualified; highly qualified; qualified; and not yet qualified. The gradings for the various qualities were increased from "above" or "below" average and average, to outstanding, very good, satisfactory, indifferent, and poor. Special reasons have to go with the reports of "exceptionally well qualified" and "not yet qualified," since they are regarded as being well above and below the average assessment. These more distinctive gradings were introduced as the result of twenty years of experience; and American practice, which began with an excessive number of grading distinctions but retreated to some extent to British simplicity, influenced British ideas. The extremes moved to each other as each learned about its own practical difficulties and the merits of the other.

Vacancies for promotion are made known through the promotion boards that exist in almost every department of English service. Evidence is gained from the supervising officer and also from the staff side of the Whitley Council of the department or of the district or office concerned. Appropriate forms are designed in order to indicate those qualifications that are not otherwise specified. The movement toward further education of the civil servant in both Britain and Germany is partly cultural, partly vocational. The result has been in Great Britain the establishment of the Institute of Public Administration and various schemes conducted by other civil service bodies connected with the civil service staff associations, and in Germany a much more ambitious scheme—the establishment in several great centers of administrative academies (*Verwaltungsakademien*). What is gained by this attention to promotion? No complete exclusion of favoritism is possible, as anywhere in life. For, if reports and personal records are drawn up, some one has to do this, and the personal factor still persists. But certain things are gained. The first is regularity of report. This means that there must be

recurrent attention to the relative merits of subordinates. The deliberateness at stated intervals conduces to conscious attempts at distinction and though there is in all countries a tendency for the certifying officer to tar all with the same brush, so that the total marks tend to prove that all are equally meritorious—distinctions are made.<sup>14</sup> The qualities mentioned in the British report forms break up the vagueness of judgment into a number of more specific questions, answers to which can only be given by close attention to their purport. The second gain which underlines and makes effective the first is the heightening of responsibility brought about by the possibility of a representation against a flagrantly unjust promotion.<sup>15</sup> And third, the staff feels that this dispensation reduces the possibility of jobbery, that they are having a "square deal," and that causes for suspicion and the furtive backbiting which is as bitter as gall in any "closed" occupation have been much diminished. The Royal Commission of 1929 (in its report of 1931) met the claims of civil servants even further—the precise terms of an adverse report are to be divulged, and sympathetic consideration is to be given to the institution of a departmental board of review which will include a staff nominee. These are important gains and well worth the time and energy expended upon the operation of the system.

Two variations of the system are worth mention. In some of the American states (Wisconsin most notably), an authority outside the department is introduced as a check upon the judgment of the departmental promoting officer; and in Australia, appeal machinery has been provided more completely than elsewhere to reduce the sense of grievance of officers who believe they are entitled to promo-

<sup>14</sup> In one of the states of the United States, the regulations compel the certifying officer to place the servants in defined grades of merit in such and such a proportion—i.e., he is compelled to make a distinction.

<sup>15</sup> The evidence before the Royal Commission, 1929, shows that such representations are made in individual cases.

tion but to whom others are preferred.<sup>16</sup> The Wisconsin system is based upon a report form very similar to that used in the British civil service. The information given in the report by the departmental superior is supplemented by the independent reports of the Civil Service Commission's examiners. They visit institutions and departments, and according to a privately circulated report of the Civil Service Commission, "In this work the examiner tries to get the officer to give a sort of word picture of each employee, noting especially those characteristics that are outstanding." The kind of information obtained is, of course, a great contrast to the percentage marks or comments on the report cards.<sup>17</sup>

The advantages claimed by the Commission for this method of personal inspection are (1) the information is more significant and vital, (2) "an appointing officer will gladly give an hour to talk over the work of his employer where he would consider the filling out of report cards as a bore, unnecessary red tape, put it off until the last thing, do it in a perfunctory way, and wonder if the reports would ever be looked at by the Civil Service Commission"; (3) close touch between the Commission and the departments fosters a spirit of cooperation; (4) the Commission is able to observe the need for reclassification and learn how best to formulate the examination.

It is quite obvious that this system can only work where the civil service is as small as it is in Wisconsin. There one approaches the manageable size of a not-too-large firm, and these personal contacts are not too costly and can be conveniently arranged. Further, the smaller the number of things to be compared, the easier the comparison; and one mind carrying a single standard minimizes the possible aberrations of judgment. Such a system could only work correspondingly

well in a large civil service if the number of the inspecting staff were large. The British civil service is some three hundred times as large as Wisconsin's, and the Prussian and Imperial and French civil services even larger. The difficulties are commensurately increased—more than commensurately, indeed, for the larger the number of human beings engaged in a task, the more difficult the agreement upon a single standard upon which to judge the officials they inspect. The solution is then one of two: either the establishment of basic principles and forms of comparison, or/and the decentralizing of selection for promotion. These are the inevitable effects of the largeness of the modern state and the vast number of civil servants it is bound to keep under a more or less centralized rule. At a certain point the economy of largescale organization seduces the ordinary man and woman from their longing for self-government.

This leads to the promotion method of the United States federal civil service: this is bound up with its efficiency-rating system and this with classification.

#### EFFICIENCY AND THE RATING OF CAPACITY

THE common notion is that civil servants have life tenure of their positions. This is nowhere true in law—for the law arranges for their dismissal or pensioning on grounds of redundancy or inefficiency. Yet in normal times, that is, when no great changes must occur (as after a war), the civil servant has come by practice to enjoy almost a life tenure, with superannuation to follow, though there is a remarkable turnover in American public services compared with others anywhere!<sup>18</sup>

What are the grounds of this lack of mobility? Some are the result of accidental, some of essential, causes. In the former class are the origins in royal tenure when the master would maintain favorites in office regardless of efficiency; the

<sup>16</sup> Cf. F. A. Bland, *The Government of Australia* (Australian Government Printing Office, 1943).

<sup>17</sup> Cf. W. E. Mosher and J. D. Kingsley, *Public Personnel Administration* (New York, 1941).

<sup>18</sup> Cf. *Ibid.*, p. 342 ff. In each year between 1925 and 1938 inclusive, not less than 13.0 per cent of voluntary quitting occurred. Cf. also figures on p. 843 above.

## PROBLEMS WHICH ARISE AFTER RECRUITMENT

exceedingly confidential-authoritarian nature of the Crown servant of earlier days; the undue reaction against "spoils." Among the more recent and essential causes are the desire of the chiefs to save the trouble of change and the pain of dismissing others; the pressure of civil servants and their organizations (which is now paralleled in private industry); the fact that the civil servant is induced to educate himself to a certain standard for the service and to take the prescribed examinations; the desire to get good work by the promise of permanent employment (and special conditions regarding discipline, civic rights, etc.). These motives have been reinforced in their effect by the difficulty of measuring the efficiency of civil servants. What cannot be measured must be endured, lest one is mistaken or accused of injustice and favoritism. It is notable that with the increased consciousness about the importance of the civil service, and the improvements in the technique of rational employment methods, every civil service bestirs itself to challenge the notion of necessary permanence in office and the rigidity of its conditions. It declares a war on "dead wood." Can that war be won?

The quest of efficiency, then, had led to attempts to expel the atmosphere of security and automatic advancement that persists in the public services, and this obviously first depends upon whether efficiency can be "rated." No country has gone further in this than the United States, at least in theory. Its work may, when we have described it, seem pedantic and pretentious, but not a little of the world's progress has been won by such work.

Two things have combined to cause the United States to push the mechanism of "rating" efficiency further than development elsewhere. The first is the fact that the federal civil service (and the state civil services, for that matter) operate in a social environment intensely individualistic and acquisitive; the lack of other traditions, the freshness of the social adventure, the spectacle of fortunes extorted from nature and fellow men—all conspire

to add a keen edge to the mental weapons of these gainful and self-realizing human beings. The civil service cannot avoid measurement in terms of this environment. Its collective and its individual services cannot be rated in a fashion very different from those of General Motors or the Chicago stockyards or Western Union Telegraphs. Individual service, efficiency, advancement, and reward are inseparable terms: so are inefficiency and demotion (the opposite of promotion) and dismissal. Secondly, there is a tremendous interest in "personnel problems," Taylorism, scientific management, and "human engineering." These two influences—the individualistic acquisitive temper, and the enthusiasm for scientific management, the worship of salvation by technology—were strengthened in power by the general inefficiency of the personnel methods which long before World War I generated a strong and persistent reform movement.

From 1913 practical attention was turned toward the problem of heightened efficiency. A small new division was created in the Civil Service Commission called the Division of Efficiency with power "to investigate the needs of the several executive departments and independent establishments with respect to personnel and for the investigation of duplication of statistical and other work . . . etc., etc." In 1916 a Bureau of Efficiency independent of the Civil Service Commission was created to give effect, among other things, to the law of 1912 prescribing the establishment and use of "efficiency ratings" in the public service.<sup>10</sup> This law provided (sect. 4) that

The Civil Service Commission shall, subject to the approval of the President, establish a system of efficiency ratings for the classified service in the several executive departments in the District of Columbia based upon records kept in each department and independent establishment with such frequency as to make

<sup>10</sup> Cf. G. A. Weber, *Organized Efforts for the Improvement of Methods of Administration in the United States* (Baltimore, 1919); and cf. L. M. Short, *National Administrative Organization of the U. S. A.* (Baltimore, 1925).

## EFFICIENCY AND THE RATING OF CAPACITY

them as nearly as possible records of fact. Such system shall provide a minimum rating of efficiency which must be attained, by an employee before he may be promoted; it shall also provide a rating below which no employee may fall without being demoted; it shall further provide for a rating below which no employee may fall without being dismissed for inefficiency.

But no real investigation or progress took place until the appointment of the Reclassification Commission in 1920. This conducted one of the finest pieces of investigation ever accomplished in the history of public administration. Its terms of reference were the investigation of rates of compensation in the civil service and the reporting on what reclassification and readjustment of compensation should be made so as to provide uniform and equitable pay for the same character of employment. . . ."<sup>20</sup>

The Commission interpreted its terms of reference very broadly and found itself concerned with three main problems: (a) promotion, (b) the relationship between efficiency and movement upward in only one class and from class to class, and (c) classification of the service.

As regards (a) and (b) the findings of the Commission were:

that no uniform practice exists in the advancement of efficient employees at either salary or rank, both of which are commonly referred to as "promotion"; that salary advancements proper are controlled by administrative officers, while true promotions are usually made as the result of noncompetitive examinations; and that lack of assurance that efficient work will receive suitable reward injures the morale and reduces the efficiency of the entire service . . ."<sup>21</sup> "Because of the absence of any centralized control over promotions and advancements, it is impossible to generalize about the methods in selecting persons for advancement when a vacancy occurs. Some offices maintain fairly elaborate systems of efficiency ratings, and have a carefully developed plan for using them, including advisory committees, and some use an exam-

ination system for certain classes. In other offices the selection is made by the administrative officer with only such advice and assistance as he may choose to seek in the particular instance. In such offices the whole question turns on the administrator's knowledge of his force, his fairness, and his judgment."<sup>22</sup>

Equity as between the various kinds of work done in the service, and efficiency and good morale within each department, depend in the first instance upon a proper classification of all the services, and the problem of equitable promotion is dependent on the problem of proper classification. This is the lesson also of the civil services of Great Britain and France.

Now, the Civil Service Act of the United States and its applicatory rules<sup>23</sup> provided jointly that the higher positions in any grade should be filled by promotion unless no one was capable of filling the position vacant, and that promotions would legally occur only by examination or exemption therefrom by the Civil Service Commission. But, as the Reclassification Commission observed, promotion was, in fact, badly organized, and the United States had suffered the brunt of the two results of this: for more people than was necessary "blind alley" occupations existed, and second, there was a tremendous "turnover" of employment, to which the petrification of opportunity was undoubtedly a contributory cause. Although the Reclassification Commission advocated competitive examinations for promotion, its recommendations of the use of "efficiency ratings" to be regularly made in the departments and checked by a central supervisory bureau were later given effect, and this system has been made the principal basis of the promotion and demotion system. Now, before "efficiency rating" can operate there must be some way of comparing like with like, and this brings us back to the problem of classification, an indispensable foundation of equity and efficiency in

## PROBLEMS WHICH ARISE AFTER RECRUITMENT

any great organization employing large numbers of officials.

### CLASSIFICATION

THE problem of classification may be thus defined: to set all servants to work which is not too difficult nor too easy for them to do; and then to treat all who do equal work, equally, and where there is a difference in the amount and quality of work done, to proportion reward to service. Upon proper classification depends the efficacy of recruitment, the possibility of creating a rational promotion system, and the equitable treatment of people working in different departments. The experience of all countries shows how necessary is such a classification, though indeed it is very difficult to establish and to maintain a developing service, and practically impossible to satisfy the individual civil servant that he has been rightly placed in any particular category. Without categories there is no calculation, no comparison, no relative assessments and evaluation; and in a popularly governed state, particularly where publicity and government by political amateurs necessitates easily grasped facts and figures, control ceases where categories end. Yet it is the placing in categories which is bitterly resented by the restive, the ambitious, and the growing; and only the paramount necessities of a control which has ceased to be personal, because the thing controlled is of too great magnitude, can justify its deadening effects. Even the crab, said William James, would very likely be filled with a sense of personal outrage at having itself classed as a crustacean and would say, "I am no such thing. I am Myself, Myself alone." But the state is too large an employer to be able to make individual bargains with each of its servants; such bargains would make legislative control quite impossible; nor is there any accurate standard available to the public service, within itself, which could be used as a basis for the exact calculation of such individual contracts. The least amount of evil in state service is produced by the best classification.

*The Reform of 1920.* This is what the American inquiry of 1920, conducted by the Reclassification Commission, fully realized. Indeed, no one contemplating the situation of the American federal civil service at the time of the inquiry could have failed to realize the significance of proper classification. The Reclassification Commission found

that the Government has no standard to guide it in fixing the pay of its employees and no working-plan for relating the salaries appropriated to the character and importance of the work for which such salaries are to be paid, and that the designations of positions now appearing in the book of estimates are inaccurate and misleading.

The inequalities made transfer from one department to the other—very desirable, within reason, as it prevents stagnation—a difficult process, since the salary differences operated as obstacles to free movement. Rational criticism and reform of promotion methods were impossible since these varied from office to office and meant something different in each department. The consequence was the degeneration of the morale of the service which could be expressed statistically by the turnover of jobs which in 1916 was 11 per cent. The way out of this administrative morass lay in instituting conditions of employment the keynotes of which should be *equity* and *uniformity*.

The basis of the system was classification; a special authority constantly to renew the classification; the relationship of salary scales to the grades then set up; and a promotion system based upon efficiency ratings, i.e., more or less exact statistical expressions of efficiency. The theory of classification involved the detailed analysis and description of every job in the government service—this was actually done at that time for over 100,000 situations, and has been carried almost to completion. This recorded and defined a position—a specific job or office. To the description of duties is added a summary of qualifications required for their execution, and the lines of advancement.

## CLASSIFICATION

All similar positions wherever they are in the service constitute a class. The next category inclusive of cognate "classes" is a series of classes or services (or "grades" as the statute of 1923 designated them). These are grouped into the great groups. The whole civil service fell, according to the Reclassification Commission, into three of these. Thus: There is a class of indexers in various departments; some grouped into the Departmental Publications and Information Service; this and other Services are grouped into (1) services involving clerical, office, or commercial work; (2) skilled trades, manual labor, public safety or related work; (3) scientific, professional, or subsidiary work.<sup>24</sup>

The essential importance of this method which differentiates it from evolution in other countries, is its conscious and minute attention to the nature of the job. Other considerations have been of some influence, even if not paramount, in Great Britain. English thought has centered rather upon the educational system of the country and the natural stages, secondary and university, at which its products were completed and sent out into the world of industry and the professions. Of course, a rough classification by the nature of the jobs was made mentally: their characteristics were enumerated in a broad unanalytical fashion, and then the classes so formed were related to recruits from the various grades of schools.

There is much to be said for the English system—taken as an extreme type—but inefficiency must be the inevitable result if it is carried to extremes. Its great advantage is that it does not influence the educational system to adapt itself to its detriment by deviation from the lines recommended by the nature of the educational process: also, it reduces the scope of the "crammer" for particular examinations. The American system classifies the

jobs, and then expects the schools to provide the education to suit them. Its particular merit is to relate the nature of the specific job to the mind training required for it, and to produce a closer relation of capacity service and reward than other systems. Yet it also is anxious to secure some contact with the schools, the lack of it is serious, as it reduces the contribution of morale and general education which the schools can be made to give and which the service supremely needs.

*The Act of 1923.* The United States Classification Act of 1923 set up the Personnel Classification Board to (1) classify and (2) review and revise the uniform system of efficiency ratings setting forth the degree of efficiency for (a) an increase in pay where the maximum is not yet attained, (b) the continuance at the existing rate without increase or decrease, (c) decrease, (d) dismissal. Each employee was to be rated by the head of his department in accordance with this scheme of rating. "The current ratings for each grade or class thereof shall be open to inspection by the representatives of the board and by the employees of the department under conditions to be determined by the board after consultation with the department heads."

Later the administration and improvement of classification and efficiency records was vested in the Civil Service Commission.<sup>25</sup> Let us examine the scheme.

The first experience of it lasted until 1935. Its very meticulousness made a blunter method thereafter necessary. But the original model still exists in its outline and purpose. It is highly ingenious and very well illustrates the intense longing for a mathematical gauge of official capacity and the extent to which such an object can be produced. Discussion will revolve round the original system and be used as the basis for theoretical analysis, and then the later amendments will be noted.

<sup>24</sup> The classification that came to prevail, though applied only to a fraction of the service, is as follows: professional and scientific; subprofessional and subscientific; clerical, administrative, and general business; and custodial, labor, and mechanical.

<sup>25</sup> Cf. J. McDiarmid, "The Changing Role of the U. S. Civil Service Commission," in *American Political Science Review*, December, 1946.

## PROBLEMS WHICH ARISE AFTER RECRUITMENT

A report upon each official was made every six months (since 1935, annually) on a special form called the graphic rating scale. A number of service elements are selected and appear upon this scale—they ordinarily numbered fifteen, but a sixteenth was kept for physical ability needed in certain positions in the custodial service. For the clerical and administrative staffs the number of elements—that is, qualities—used in rating an employee varied from four to ten, being usually five or six, the exact number depending in all cases upon the nature of the duties performed. It is clear that every class in the service needs for the exercise of its functions a different combination of these elements. Not only this, but among these elements some are more important than others. Therefore, not only is a selection of the elements necessary, but also a "weighting" of them, according to their importance, and this is expressed in percentages. Only experience can say what elements are necessary and determine their weights.

It may be asked, why stop at fifteen elements? The diversity of human occupation and services is more minutely divisible than these. The answer is that division has somewhere to stop, for without simplicity there may be confusion, and control is defeated. Once more the need for comparison and control of a multitude of officials by a single mind (the Civil Service Commission and Congress) dictates the situation. Further, the greater the subdivision, the more room for departmental choice of the elements, and again the difficulty of judging the relative merit in the aggregate of one official and another. Yet this analysis of human qualities is necessary in the public service because the principle of free price-making and free profit-making has been discarded as the consumers' check upon the producers' aptitude, and any control is therefore bound to be on the ingredients which may compose efficiency.

The service elements on the graphic rating scale were: (1) accuracy; (2) dependability; (3) neatness and orderliness of work; (4) speed with which work is

accomplished; (5) industry, diligence, energy, and application to duties; (6) knowledge of work; (7) judgment, common sense, wish to profit by experience; (8) success in winning confidence and respect through personality; courtesy and tact, control of emotions, poise; (9) cooperativeness; readiness to give new ideas and methods a fair trial; obedience to the management; (10) initiative, resourcefulness, inventiveness; (11) execution of work; (12) ability to organize, ability to delegate authority, to plan work; (13) leadership; ability to get cooperation of subordinates, decisiveness, self-control, tact, courage, fairness in dealing with others; (14) success in improving and developing employees by informing them, developing talent, arousing ambition; (15) quantity of work (to be used only when accurate and competent output records are kept). Thus the United States succeeded, by five points, in putting the English report form in the shade. It is an interesting analysis of psychological working qualities.<sup>28</sup>

Departmental rating offices marked the scale in those elements already combined by the (then) Personnel Classification Board. In pitching their mental mercury at a standard, they were instructed to have in mind "reasonable performance standards for the compensation grade in which that class is found." When the rating was done, reviewing officers in the departments compared the rating of different rating officers and smoothed out the results of abnormal variations of standard. These were then submitted to a board of review (a number of higher departmental officers). The board discovered the percentage per element, multiplied it by the weight assigned to that particular element, and found the weighted average by totaling the weighted element ratings, and pointing off two decimals. The board of review were informed in a series of "suggestions" how to control the ratings. They were expected to prorate the ratings up or down in order that the final ratings should

<sup>28</sup> Cf. the more recent one, Appendix A.

## CLASSIFICATION

come to an average of from 80 per cent to 84 per cent for acceptable workers. The result was the final efficiency rating. A report was drawn up in order of the efficiency ratings.

The eligibility of employees to receive specific salaries within the grade ranges, on the basis of their efficiency ratings, was indicated in a special table.

*Survey of American Classification Scheme.* I have entered into some detail in discussing this scheme because it is a fine illustration of the devices which the modern state is forced to adopt if it wishes to secure as strict a control over the efficiency of its employees as any private employer does. It is a tremendous apparatus, and a very delicate one, to have to operate, but short of a high degree of native public spirit, enterprise, and freshness of mind in the civil servant, there is no logical escape from such a system of control, if efficiency is really desired. If every penny is counted, and if for each penny the maximum of return is to be obtained, some such scheme is indispensable. For, as we know, the general defect of a civil service is its sheltered position. It is sheltered from the risks of trade fluctuations, from the thousand and one environmental and human vagaries which make all the difference between business success and failure. Its pay and other conditions of employment are not subject directly to what it can make by its service to a consumer who has alternative sources of supply. Its contract is founded upon one of the surest and most unchangeable bases; the authority of the state, the need people have of the state, of order, if not of specific services. And this foundation gives a sound title to taxation—the source of salaries.

Without, however, the possibility of movement, of fresh currents of desire, a standard of attainment and accountability without risks and threats, fluctuations in reward and punishment, the average human being tends to fall into a state of unenterprising complacency, fitting his habits and mode of life to his predetermined pay and position. The most universal popular complaint about the civil

service is the somatic condition at which even fresh entrants ultimately arrive, and the disease is caused by lack of incentive. The mind and body, it is alleged, are simply not kept on the stretch, and they cease to be creative. It is a condition which is comfortable for the civil servants, and for the order and regularity of the service; in the slick performance of routine it is providential—not a single unexpected thing happens; but society is apt to be the loser. Security of service and regularity of advancement are indispensable for some occupations in life, though the argument may be driven too far; but for the mass of men they cause enterprise to run down to the minimum point at which slackness, though existent, is undetectable. The English, the French, and the American schemes are designed to restore movement, hope, despair, acquisitiveness, and so stimulate effort. Of course, the main allegation may be exaggerated.

This problem has become more serious in proportion as the state has further socialized various services; it is well-known in the great private enterprise monopolies of today.<sup>27</sup> In proportion as the circle of private enterprise decreases, the opportunities of comparison of conditions inside with conditions outside the service will decrease, and in proportion as laws are made, the activity of civil servants is at once dictated and confined. Further, the greater the number of services rendered by the state without a price, a direct *quid pro quo*, the fewer will be the bases for accurate rating of the produce of officials. The system we have just described is a perfect illustration of the extent to which judgments of the civil service are linguistic rather than numerical. Efficiency-rating schemes will become more and more universal, and, even as at the present time, legislatures have come to demand that estimates and accounts be presented to them in a form enabling comparison to be made between units of

---

<sup>27</sup> Cf. Marshall Dimock, *Bureaucracy and Trusteeship in Large-Scale Business* (Temporary National Economic Committee Monograph, 1941).

## PROBLEMS WHICH ARISE AFTER RECRUITMENT

expenditure in one department and another, so must they, if they desire, in whatsoever form, to retain the control of the executive, obtain an insight if not an actual control, over the efficiency-rating machinery—the boards of review and the rest.

The efficiency-rating scheme that operated to 1935 was found to suffer from certain operational rather than conceptual defects. The numerical rating, which was taken to the second decimal point, was excessively refined. The moderation of the rating made by the immediate supervisor, by reviewers who softened the hard-boiled and fortified the soft, aroused the wrath and unwillingness of the supervisors to take responsibility for a judgment not their own. The legislative requirement that as many ratings be above a stated average as below it, whether men were like that or not, caused all sorts of artificial contortions. To suit this system to the related increments, demotions and promotions dependent on minute differentiations became really impossible: a breakdown of the integrity of the rating system occurred. Who would rate so minutely with such dire consequences, and with the knowledge that perhaps the next-door supervisor was easier in his ratings?

In 1935 a simpler form was introduced,<sup>28</sup> with about the same number of service qualities, but without numerical calibration. Close to the British method, the ratings were: excellent; very good; good; fair; and unsatisfactory. To these corresponded respectively the consequences: promotable within grade if below top salary; the same; no salary change if receiving middle salary or above; if below middle, promotable not beyond it; reduce one step if above middle salary; dismiss from present position. The ratings are required to be considered when the force is reduced.

It should not be forgotten that, if necessary, the servant has a well-organized course of appeal to the Civil Service

Commission against the rating to which he has been doomed, and that the supervisor who makes the rating is therefore challengeable, and may be called upon to state the grounds of his judgment. The rating form of each employee must be available to him for his inspection.

Finally, it is interesting to observe that the modern ideas of classification give to the agency which conducts it, a participation in general administration responsibilities, in that their task of periodical job-reviews is to be instrumental to reorganizations of operation and personnel.

Whatever the actual outcome of the American experiment, it is at least a valiant and capable attempt at finding a solution. We may, according to the amount of cynicism in our character, smile a little grimly at their belief that human nature is so to be analyzed, calibrated, and recorded, and that this is a practicable way of controlling it. But stranger things than that already exist in human institutions—e.g., you cannot become a civil servant without an examination. And with a change of social forms and state activity, stranger things yet will be generated.

The most recent reconsideration of the federal efficiency-record system (Hoover Commission) ends with a scathing denunciation of its inefficiency.

In its "Personnel Management" (p. 29), the Commission states that:

The present efficiency-rating procedures in the Federal Government have the effect of undermining supervisor-employee relationships.

It bases its conclusions on the fact that the system, under certain circumstances, makes mandatory either a public reward or a public penalty; that the supervisor's determination is subject to challenge and revision at three higher levels; that the efficiency rating process is based upon contradictory and unvalidated assumptions; and that the system is not used to the extent that it should be as an aid in the development of the employee and for the purposes of measuring the employee's potential usefulness to the organization.

All of this was predicted, based on common sense knowledge of human na-

<sup>28</sup> Cf. Standard Form 51, December 1943, p. 19, *Efficiency Rating Manual*, Civil Service Commission and Appendix A, below.

## TRAINING OF CIVIL SERVANTS

ture in administration over the centuries. It is an interesting question why such common sense came to be ignored? At any rate, bitter experience has confirmed it.

### TRAINING OF CIVIL SERVANTS

WHEN officials have been recruited, especially at a young age, they are to the services merely raw recruits. It is true that many of them have by their education, even when not prescribed by the rules of recruitment, acquired a fairly accurate knowledge of the rudiments of their coming position and the role it plays in the whole picture of the profession. Yet this cannot be sharply clear and ever-impressive. Others, in the services which permit recruitment at an advanced age, may have acquired principles of business behavior perfectly appropriate elsewhere but not sufficiently judicious or equitable for the public services. Both these elements need specific induction into their work. It can, of course, be obtained by immediate immersion in the job, with the hope that the entrants will pick up what is required in the process of doing it. The result is not certain, may never be achieved, and wrong ideas may mar an official's work for years until accident puts him right, if it ever does. These are the cogent arguments for deliberately established procedures for postentry training.

There are others of at least equal importance. It will have been observed that much importance has in the previous pages been attached to the fact that the public services are "sheltered," that is, not subject to the continual competition that still prevails in many branches of private enterprise. We have stressed the relative lack of movement and animation by promotion or transfer or the invention of new jobs or demotion or dismissal. Now this is a relative, not an absolute, factor: in some grades and classes of the services there is substantial movement; in some big businesses there is little movement. It is essential that the public services should deliberately provide something which will stimulate thought and

aspiration. Educational courses are helpful in this, especially when they are linked with credits required for promotion.

Furthermore, as officials stay in the service beyond their first youth, some of the freshness of hope and courage fade in some. Some men and women become tired as they do in almost every walk of life. In politics the process is sometimes correctly called conservatism. In life generally it is sometimes seen as cynicism: a disbelief in the value of the function one is performing—not to the point of causing retirement, not a disbelief in one's own professional work any more than a disbelief in much else besides, but still, no energetic urge any longer dictates administrative enterprises: they no longer have, in Shakespeare's words "pith and moment."

This advent of the *blasé* years is expressed in a mild defensive tone by a British civil servant of long and successful career, in answer to the present author's charge of "cynicism." Sir Henry Dale says: <sup>20</sup>

This steady lengthening and widening of experience confirm in high officials a certain way of looking at things, a habit of mind issuing in a certain creed consciously or subconsciously held by most of them. . .

The substance of that creed may be compressed into five propositions, none of which is at all novel. First, pure reason is not at present the most important factor in human affairs. Second, even in the realm of pure reason there is much to be said for both sides on any complicated question which is fiercely disputed, and in the modern world all serious questions are complicated. Third, in a vast and highly organized society, great social, economic, and political changes (call them reforms if you like) cannot be made quickly without causing some unmerited suffering. Fourth, a minority which feels strongly and shouts loudly will often prevail against both the majority and the merits, unless the majority itself feels strongly. Fifth, in this complex and rapidly changing world, any great measure, whether legislative or executive, is sure to have results, often very grave results, which no one foresaw; in other words, the strongest intellect and the keenest in-

<sup>20</sup> Cf. his *The Higher Civil Service of Great Britain* (London, 1941), pp. 92 and 93.

## PROBLEMS WHICH ARISE AFTER RECRUITMENT

sight cannot predict anything like the full consequences of important decisions.

... It is possible to be enthusiastic for moderation and prudence. That is the attitude of mind which may, I think, be properly attributed to the chiefs of the Civil Service; will any sensible man call it cynicism?

Now, it is perfectly possible that this is not cynicism but wisdom. In order to make sure that this "stoical realism," as the author calls it, is the latter and not the former, and that it is truly the result of garnered experience and not the mere passage of the years, there is everything to be said in favor of measures which may offer to counteract the latter.

The general scheme of training set up in France in 1945 has already been noted, and it will be remembered the *Statut des Fonctionnaires* requires training of civil servants of all ranks as part of the arrangements for promotion. We have also briefly traced the arrangements of the United States civil service for postentry or in-training, as yet not as complete in practice as is desirable.

Attention has been drawn to the interest of the British civil service in the matter, and a few further observations are desirable.

The *Report of the Committee on the Training of Civil Servants*<sup>80</sup> provides a general theory of training, and recommends the practical arrangements for giving effect to it. We are rather more concerned with the former than with the latter.

The recommendations of the Committee derive from two things: an appreciation of the faults of the civil service, and a view of the function of the civil service in the modern state. As to the faults, the committee reported:<sup>81</sup>

The faults most frequently enumerated are over-devotion to precedent; remoteness from the rest of the community, inaccessibility, and faulty handling of the general public; lack of initiative and imagination; ineffective organisation and misuse of manpower; procrastination and unwillingness to take responsibility or give decisions. We recognize

that these defects exist in some measure—though not so generally or in such degree as is often alleged—and whether they derive from the individual or the system, post-entry training must be directed to eliminating them.

As for the objects and general principles of training the committee said:<sup>82</sup>

At the outset we asked ourselves the question: "What is the object of training?" If the answer is that it is to attain the greatest possible degree of efficiency, then the word efficiency seems to need some closer definition. In any large-scale organisation efficiency depends on two elements: the technical efficiency of the individual to do the particular work allotted to him, and the less tangible efficiency of the organisation as a corporate body derived from the collective spirit and outlook of the individuals of which the body is composed. Training must have regard to both elements.

Five main aims present themselves.

First, training should endeavour to produce a civil servant whose precision and clarity in the transaction of business can be taken for granted.

In the second place, the civil servant must be attuned to the tasks which he will be called upon to perform in a changing world. The Civil Service must continuously and boldly adjust its outlook and its methods to the new needs of new times.

Thirdly, there is a need to develop resistance to the danger of the civil servant becoming mechanised by the machine; whilst we must aim at the highest possible standard of efficiency, our purpose is not to produce a robot-like, mechanically-perfect Civil Service. The recruit from the first should be made aware of the relation of his work to the service rendered by his Department in the community. The capacity to see what he is doing in a wider setting will make the work not only more valuable to his Department but more stimulating to himself. In addition, therefore, to purely vocational training directed to the proper performance of his day-to-day work, he should receive instruction on a broader basis as well as encouragement to persevere with his own educational development.

Fourthly, even as regards vocational training, it is not sufficient to train solely for the job which lies immediately at hand. Training must be directed not only to enabling an individual to perform his current work more

<sup>80</sup> Cmd. 6525, 1944.

<sup>81</sup> Para. 13.

<sup>82</sup> Paras. 15 and 16.

## TRAINING OF CIVIL SERVANTS

efficiently, but also to fitting him for other duties, and where appropriate, developing his capacity for higher work and greater responsibilities.

Fifthly, even these ends are not in themselves enough. Large numbers of people have inevitably to spend most of their working lives upon tasks of a routine character, and with this human problem ever in the background, training plans, to be successful, must pay substantial regard to staff morale.

The arrangements, put into force in 1945, after full conference with the representative organizations of the various classes of civil servants, are administered by a newly established Director of Education and Training in the Treasury.

Training schemes are devised in each department by departmental training officers under the authority of the establishment officers and the head of the whole department. They are devised and carried out with the cooperation of the joint committees, the Whitley Councils, to be discussed presently (Chap. 35). Training arrangements include reception of the new entrants by a specially appointed official in each department, who impresses upon them the prestige they must uphold, the functions they render to the community, and the history and functions of the department. Then attention is paid to the general system of working in a government office, the duties, organization, confidential nature of the work, discipline, and so on. Training follows in the actual duties. After this, mobility in the department is organized to relieve monotony and widen the official's outlook and comprehension. Those who show the qualities which make for effective supervisory duties are picked out and given tuition in personnel work.

The training so far mentioned does not include all that the training plans provide for. The departments encourage their staffs to acquire outside vocational qualifications, in some cases allowing time off and paying the fees. Lest this should be of a narrowing effect, the encouragement to further education extends to nonvocational education, in the form of university extension lectures,

evening classes, and such like. For this purpose the civil servants cooperate with the local schools and colleges.

It should be remembered that any qualification or distinction won at such courses, nonvocational as well as vocational, is recorded on the annual report form which may lead to promotion.

Within the departments, frequent conferences are held, to explain work procedures, the problems of implementing the statutes, the reason for new regulations, the problems raised by public complaints, the realization of policies old and new.

We have already referred to the special attention paid since the end of World War II to the initiation of the administrative class entrants into their work, and to the institution of the system of sabbatical leave for those who after a few years of service have shown exceptional promise. As to the former, a systematic course of lectures and seminars for two days a week over a period of two or three months teaches the nature and art of administration, the techniques the service uses, the standards of conduct it requires. This is combined with "live work" from the outset, and a well-thought-out rotation within the divisions of the department and spells of work in the field services of the department. This now replaces the old method of putting the man to work at once, and reliance merely upon learning from observation of others.

It will be surmised that the provision of additional opportunities of promotion, the appointment of officials especially concerned with personnel work, with listening to appeals, reviewing the personnel administration of subordinate supervisory officials, and the thorough fulfillment of a well-devised policy of in-training, means that more officials must be appointed and more expense incurred. Only the myopic or ill-willed would attack such expenditures and activities as uneconomic or wasteful. A small amount of expenditure on the appropriate arrangements in the respects we have noted can bring truly enormous benefits in return.

## PROBLEMS WHICH ARISE AFTER RECRUITMENT

### DISCIPLINE, MORALE, LOYALTY

GRATIFICATION of ambition, the acquisition of power, and increases of salary, are not the only incentives to good and better work. Often, indeed, these incentives cannot operate. Where a settled state of establishment has been reached, where all the prizes and the risks are foreknown, these tend to lose their virtue owing to their certainty, and States have found themselves compelled to introduce codes of discipline, more or less detailed, more or less severely enforced. The means to the enforcement of the conditions of work in private industry are well known and may be violent: the employer in person, or his representatives (the foreman, the subdirectors, the managers) are watchful for threats to the profit-making capacity of the firm, and the lame, the crippled, the incapable, the recalcitrant, may suffer many penalties up to the point of dismissal or enforced resignation. The non-competitive, sheltered nature of the public services blunts the edge of industrial discipline, for one cannot calculate quite so well how many pounds will be lost by certain special behavior. Further, the public services have a special dignity of a like kind to, but different in degree from, the great professions of medicine and law. The public services are, in its concrete forms, the state, and they may not behave like lesser associations in their everyday contact with their customers and their colleagues.

*Disciplinary Regulations.* We are now concerned principally with the regulations of the activity of civil servants designed to secure efficient work. In this matter Germany has the longest experience and is, indeed, the pioneer. Her rules are publicly known and constitute a large and definite chapter in constitutional jurisprudence. It is most convenient for exposition, therefore, to rehearse the German provisions, adding comments to the parallels or divergencies of the civil services of the United States, Britain, and France.<sup>33</sup>

<sup>33</sup> I follow principally A. Brand, *Das Beamtenrecht*, 2nd edition (Berlin, 1926); A. Schulze

(1) The civil servant is required conscientiously to discharge his office and all the duties directly appertaining thereto, in accordance with the constitution and the laws, to obey the official orders of his superiors, in so far as they do not contradict the law, and to behave worthily of the respect accorded to his office.

The obligation of obedience to a superior does not extend to action and judgment while member of a board. On the contrary, the official is there expected to observe only the laws and the statutory orders, and to make his decision and give his vote quite independently, according to his free judgment and the dictates of his conscience. He must never allow himself to be moved from this free decision by the fact that his superior is a colleague on the board and differs from him in opinion.

It is not the business of an inferior to question the material value, the policy, of his superior's order. He is sheltered from responsibility if the command passes four tests: it must be (a) within the local and material competence of the superior, (b) and of the subordinate, (c) not contrary to the laws and the constitution, and (d) regular in form. When the official does not obey, it is at his own risk. He becomes liable to disciplinary penalties if his disobedience is declared unjustified by the higher official or the disciplinary judge. Only an immaculate judgment on the part of the inferior will avoid a penalty. When the official is in doubt, therefore, he is counseled to obey, and then make a complaint afterwards.

This injunction of obedience is paramount: yet it will be noticed that it is qualified when officials are members of policy-creating bodies. Indeed, on such bodies, and even elsewhere in the hierarchy of action, it is important to protect and encourage independence of mind.

and W. Simons, *Die Rechtsprechung des Reichsdisziplinarhofs* (Berlin, 1926), Sect. 8; Julius Hatschek, *Deutsches und Preussisches Staatsrecht* (Berlin, 1921 and 1923); and H. Assman, *Die Dienstvergehen der deutschen Beamten* (Berlin, 1926).

Frankness of opinion needs protection because it is the safeguard of the most precious element in administration: originality, inventiveness, new ideas, stimulation of emotion and emulation. In the British and the American civil service, the same rule derives in the former from the ancient service of the Crown and in the latter from the civil service statutes and executive orders. Yet in these services the spirit was favorable to independence of mind more than in the German civil service, whether before or during Hitler's régime. The political system and the society have much to do with the relative easiness of relations in the hierarchy in the democratic countries compared with Germany even during the Weimar period.

It will be convenient later<sup>34</sup> to quote the British doctrine of the duty of independence of mind in actual practice. At this point it is meet to draw attention to the defense made by the American State Department of two of its officials who had sent to the department from China reports which did not please Ambassador Hurley in Chungking, and against which he vehemently protested. The doctrine is exquisite.<sup>35</sup>

What it amounts to is that within proper channels they expressed to those under whom they served certain views which differed to a greater or less extent from the policies of the government as then defined. Of course, it is the duty of every officer of the United States to abide by and to administer the declared policy of his Government. But conditions change, and often change quickly in the affairs of governments. Whenever an official honestly believes that changed conditions require it, he should not hesitate to express his views to his superior. . . . I should be profoundly unhappy to learn that any officer of the Department of State, within or without the foreign service, might feel bound to refrain from submitting through proper channels an honest report or recommendation for fear of offending me or anyone else in the department. If that day should arrive, I will have lost the very essence of the assistance

and guidance I require for the successful discharge of the heavy responsibilities of my office.

There is hardly a single administrative post, however humble in the hierarchy, whether strictly executive or policy-making, which does not contain some particle of doubt and change and growth. None should therefore be deterred by an even unspoken menace from opening his mind, none should be discouraged from expressing doubts by the tacit offer of rewards. It is the vital task of official superiors to nurture and defend the original-minded.

Something of this idea of independence of mind<sup>36</sup> is lodged in the theory of the public corporation as a form of administration,<sup>37</sup> best expressed perhaps in President Roosevelt's message to Congress recommending establishment of the TVA: "a corporation clothed with the power of Government but possessed of the flexibility and initiative of a private enterprise." And the student, while remembering the strength of the decision in *Myers versus the United States*, and *Morgan versus the TVA*, will not forget the essence of the rule favoring independence of mind in *Rathbun versus the United States* where the Tariff Commission was characterized as "free to exercise its judgment."

Of course, it is a matter of tact, sometimes of genius, for both superior and subordinate to appreciate exactly where the line must be drawn between immediate obedience and independence. Both are necessary: in executive posts, and the more urgent the service rendered the more so, is obedience peremptory, to act first and talk afterwards.

The development of planned economies, with the state in management of industries, has deepened the concern for independence of mind on the part of the actual day-by-day administrators of the

## PROBLEMS WHICH ARISE AFTER RECRUITMENT

banks, mines, power utilities, transport, steel plants, medical services.<sup>38</sup>

(2) Civil servants must carry out the duties of their office with the greatest sincerity and probity, without regard to private advantage; with the greatest impartiality, with all industriousness, and care. The official must be especially on his guard against partiality. Various decisions have made clear the meaning of this rule. For example, an official whose personal interest is likely to be materially affected in the exercise of his functions must withdraw from such an affair. No money may be accepted for benefits conferred by official activities. As to capacity to fulfill his duties, sheer ignorance, physical inability, or mental aberration would lead not to disciplinary action but to dismissal from the service. But the law acts with a disciplinary intention where such incapacity is or may be brought on by the official's voluntary behavior, for example, by dissipation, drunkenness, or waste of time such as that of him "who without permission from his superiors seeks out a colleague during service hours and talks over a private matter for an undue length of time."<sup>39</sup>

Beyond this there are many special rules, especially appropriate to different classes of work. For example, extraordinary weight is laid upon the impartiality and incorruptibility of the officials, and upon the absolute inviolability of secrecy of posts, telegraphs, and cables. We find similar special rules in the civil services of other countries also.<sup>40</sup>

<sup>38</sup> Cf. Herman Finer, "British Reconstruction and Planning," *International Labour Review*, March and April, 1948.

<sup>39</sup> Braud, *op. cit.*, p. 424 and footnote.

<sup>40</sup> Cf. British Revenue Officials (volume on administration, the instruction books): "Having regard to the technical and frequently contentious nature of the work, it is not always easy to satisfy taxpayers as to their obligations and rights under the Income Tax Acts, and it frequently happens that a taxpayer feels a sense of grievance for which there may be no grounds apparent to a member of the staff. In such cases, patient attention and a courteous explanation of the point at issue will do much to remove any sense of grievance and expedite the settlement of a case," etc., etc.

(3) Civil servants must keep punctually to the hours of arrival at and leaving their work.

(4) Without the official's having a legal claim to extra pay, an extension or alteration of existing functions may take place, so long as the new work corresponds to the training and capacity of the official, and is not of an entirely different nature, and is derogatory neither to the normal activity of the official nor to the honor of his rank. When special help is demanded during a strike to make up what the strikers would normally have done, all officials are obliged to obey—even higher officials are obliged, where necessary, to do purely physical labor. These duties are nowhere stated so absolutely outside the German civil service.

(5) Civil servants are obliged to be truthful in official dealings, even when they are under a charge, and they must not pass over in silence important facts the disclosure of which is of concern to the department. This obligation of candor and truthfulness extends to information which is demanded about extra-official behavior.

(6) Respect for superiors is demanded, outside as well as inside the office, even when the superior is objectionable in character and demeanor. The forms of this respect have in Germany alone been construed in terms of superlative subtlety. For example, you may not omit the usual daily greeting, but women cannot be expected to greet their superiors first;<sup>41</sup> when your superior enters the room you must rise; and then, towards all officials, inside and outside the office, a respectful attitude must be observed, especially to any of a higher grade! The president of a Staff Council must preserve this respectful attitude even during the course of his presidential duties!

In their intercourse with the public, officials must always be courteous. They must avoid roughness and apathy; they must be friendly

<sup>41</sup> A civil servant has answered this difficult question thus: "A woman civil servant nods first to a man when he is a superior officer, very old, or has otherwise a generally higher social standing."

and obliging; must try to further the affairs of all who appeal to them, and readily give advice and information to persons who are ignorant of the law and official routine, providing that official duties or the legitimate interests of others are not opposed thereto. Quiet and circumspection must be observed, since procedure may easily awaken an impression of violence and prejudice and make difficult the execution of business. The mode of dealing with the public also depends in a certain measure upon the educational level and the breeding of the individual, and the right way here will be indicated by the natural tactfulness of the official. Officials must be helpful to each other.<sup>42</sup>

(8) Officials must not allow insults to pass unnoticed, lest the service should suffer degradation.<sup>43</sup> By the Criminal Code (clause 196) an action lies against persons who insult an official (*Beamtenbeleidigung*). In cases where the official is in doubt about the significance of the insult, he may consult his superior, who may take an action for insult if this occurred during the exercise, or otherwise in respect of, the official's duties. Indeed, to maintain the dignity of the state (as authority), the superior may not consider whether the official was personally hurt or not and whether or not he desires an action to be taken. It is the office, Authority, which is of paramount importance. That this is so is proved by the opinion (which is, however, a subject of dispute) that the department has a right to forbid an official from taking action if the publicity of court proceedings would prejudice the interests of the service. In such cases, it is held by jurists of good repute, the personal claim of an official to satisfaction must give way to the interest of the department. The French *Statut des Fonctionnaires* reiterates the right of officials to protection against threats, assaults, insults, and defamation: the administration is obliged to protect them (article 15). Neither in British nor United States law and practice does this remnant of *lèse majesté* appear in a special form.

(9) Such behavior is enjoined in non-

official life that the dignity, confidence, and respect bound up with the office shall not be disadvantageously affected.<sup>44</sup> The Frederickian Code, the *Allgemeines Landrecht*, already forbade irregular life, gambling and the contracting of debts, and condemned officials who made themselves despicable by base behavior. Officials connected with any financial departments are forbidden to speculate, and this as well as drunkenness and frivolous contracting of debts may result in dismissal. Nor may an official deliberately endanger his health or protract his convalescence by foolish behavior. In short,

every official must in his extra-official life have regard to the special obligations which his official position imposes upon him. The official must therefore so order his general way of life to conform to prevalent opinions on virtue, manners, and morals. This duty he owes, not only to his master, the State, to which he stands in a special relationship of loyalty, but to the whole of officialdom, which ought to suffer in its ranks only worthy professional colleagues.<sup>45</sup>

The jurisprudence on this subject—the general moral behavior of officials in their private lives—is voluminous. For example, careful distinctions, which we need not investigate too closely here, are made in the matter of sexual relations, in order to separate self-regarding from service-regarding behavior. As soon as such behavior becomes publicly known and can redound to the discredit of the service, a breach of discipline has been committed. This discipline is especially strict (quite naturally) in relation to school teachers, and marriages must be notified as soon as they take place, including the name and profession of the father-in-law.<sup>46</sup> Again, drunkenness, occasional and chronic, is classed according to its effect upon the

<sup>44</sup> Cf. for France the doctrine (Jèze, *op. cit.*, Vol. II, p. 91) of *dignité de la vie privée*. Its derogation is a service fault subject to official discipline.

<sup>45</sup> Brand, *op. cit.*, p. 429.

<sup>46</sup> The severity of the rules was originally most marked in the financial departments—at one time, previous permission to marry had to be asked for and granted.

<sup>42</sup> Translated almost verbatim from Brand, *op. cit.*, pp. 427-28.

<sup>43</sup> Schulze-Simons, *op. cit.*, p. 231; 22.12.13.

## PROBLEMS WHICH ARISE AFTER RECRUITMENT

official, his cooperativeness, his dignity, and the degree of responsibility and sobriety strictly required for his work. Police officials have especially severe obligations of sobriety. In the matter of contracting debts, not only is the official himself watched, reprimanded, and fined when the matter becomes serious and damaging enough, but he is expected to stop his wife from frivolous domestic economy! Games of chance may be played, in good company, so long as one's economic independence is not thereby jeopardized!

Nothing like the detail and severity of this is reproduced in the British, French, and American civil services, though it is an understood rule that the service is not to be brought into disrepute and that officials must be capable of fulfilling their tasks physically and intellectually and morally, and that any shortcoming in these respects would, when punished, act as corrective examples on extra-official behavior leading up to inefficiency. But the method is not direct, it is roundabout. The British civil service is also hostile to gambling and moneylenders, yet it merely points out in a Treasury circular that there are no such things as good moneylenders, but only bad and worse.

The purpose of such principles, whether direct or indirect, is to prevent officials from falling under the influence of men outside the department to the extent that they may be afraid to exercise their duty energetically and impartially. If matters were left to themselves, it could happen that moneylending and gambling transactions and indulgence in strong drink and other sensual pleasures could ruin all the calculated relationships of authority among civil servants themselves. In private enterprise these matters are left much to themselves, though there are businesses and professions which tacitly or by stated rules exact good social behavior of their officials. For the most part, however, punishment is expected to come from business losses, and fine behavior is expected to be rewarded by success, that is, profits and prestige. As we have so often repeated, the rewards and punishments of official life are not usually as direct and

impressive: hence the establishment of rules anticipating possible aberrations.

(10) No official may take on any additional offices or employments, other than those for which he has asked and obtained permission of the appropriate departmental authority.<sup>47</sup> It is an axiom of the service that *all* the official's time and energy must be devoted to the proper fulfillment of official duties. (The right to take part in political activity is a special case to which we later devote special attention.) Paid membership of boards of directors or management of a limited liability company, cooperative society, or any other profit-making corporation is entirely forbidden to whole-time officials, but mutual provident societies do not fall under this ban.<sup>48</sup> Other types of subsidiary employment, like agencies for insurance companies, trusteeships, accountancy, editorship of periodicals, coaching, the carrying on of a craft or trade, require no permission. No such permission is given for the management of a tavern or an open stall. The wife, children, and servants of an official are given permission to carry on only those trades which are not likely to result in the degradation of official dignity. Nor is the official now given permission for continuous and regularly paid professional orchestral and concert performances.

(11) The civil servants must observe official secrecy.

These duties form a comprehensive code of behavior which the civil servant is obliged to respect.<sup>49</sup> Penalties of various grades up to the point of dismissal are attached to them, and their intention is to maintain the efficiency of the service. No state is without them, although there are differences of content and form. The tre-

<sup>47</sup> Cf. Brand, *op. cit.*, Part VIII, Sects. 147-52. Cf. also France, *Statut des Fonctionnaires*, articles 8-10, (a very rigorous set of principles): "interests of a nature to compromise his [the official's] independence."

<sup>48</sup> So almost identically in France since 1940.

<sup>49</sup> The rules were maintained throughout the Hitler period, and, indeed, were reinforced by additional duties designed to make the service even more subservient to political and top administrative direction.

mendous difference between Germany and other countries is this: that while she has a code stated quite publicly in a convenient form, Great Britain had only an incomplete set of Treasury circulars and minutes and departmental rules, without coherence and uninformed by a deliberately applied mind;<sup>50</sup> the United States has only departmental rules and a few clauses in certain statutes,<sup>51</sup> and France until the statute of 1946 had only a number of principles flowing from the general axiom that the service must serve the state, and these principles were enunciated occasionally by the *Conseil d'État*.<sup>52</sup> Secondly, whereas the Continent has a regular set of law courts (administrative tribunals for the most part) which are specifically competent in this matter, England relies upon the ordinary sense of justice of the departmental chiefs (which may or may not be a valuable safeguard), and in the final resort upon the minister and the Treasury, in serious cases, and extraordinary tribunals when a particularly striking scandal occurs, as in the Gregory and Bullock cases, and the United States upon the head of the department and review by the Civil Service Commission.

*Discipline and Morale.* These rules are ubiquitous and ever-present threats, and the essence of their purpose is subordination and devotion. They are, in a sense, of the nature of a state religion. They are those commandments which issue from the nature of the state, and are based upon the desire to maintain the state. An analysis of the nature of any one of these obligations ultimately ends in revealing some aspect of the general nature of the state—whether it be authority, or order, or service, or impartiality among the various social contestants for power. Given the nature of the state one can, on the contrary, work back to these rules: they are the inevitable expression thereof; and

who wills the one wills the other. Some may be practiced a little too roughly, some too mildly; some may be antiquated and deserve abolition, and again there are others which ought to be included but are not. But in their substance they are calculated to create a mentality and supply incentives so that the public services may operate effectively in spite of the fact that the rather violent discipline—the economic fears and aspirations—of the competitive and profit-making world is absent. They are in part a substitute for the rough justice of the manager, the foreman, and the customer's dissatisfaction with services and commodities produced by the private employee. But, of course, the great monopolistic businesses of the modern world, especially where their market is inelastic, are obliged to adopt similar methods to secure steady creativeness, and, in fact, they do so.

In the Gregory case, the Board of Inquiry set down the doctrine for the British civil service<sup>53</sup> and reaffirmed it in the Bullock case.<sup>54</sup>

... the Civil Service, like every other profession, has its unwritten code of ethics and conduct for which the most effective sanction lies in the public opinion of the service itself, and it is upon the maintenance of a sound and healthy public opinion within the service that its value and efficiency chiefly depend.

The first duty of a civil servant is to give all his undivided allegiance to the state at all times and on all occasions when the state has a claim upon his services. With his private

<sup>50</sup> Cf. Royal Commission on the Civil Service (1929), Introductory Memoranda (63-49), p. iv ff.

<sup>51</sup> Cf. U. S. Civil Service Commission: Annual Reports, Directory and Prohibitory Statutes, and Rules.

<sup>52</sup> Cf. Jèze, *op. cit.*, Vol. II, Chap. 2.

<sup>53</sup> Report of the board of inquiry . . . to investigate certain statements affecting civil servants, Cmd. 3037, 1928, p. 21.

<sup>54</sup> Report of the board of inquiry . . . to investigate certain discussions engaged in by the Permanent Secretary to the Air Ministry, Cmd. 5254, 1936. Sir Christopher Bullock had interlaced public negotiations regarding the charter of the Imperial Airways with the advancement of his personal interests. The Board said: "We do not say that he consciously used his official position to further his interests; yet we cannot but think that it was the official position he held that provided the vantage ground. . . ." The report refers to the "lack of that instinct and perception from which is derived the sure guide by which the conduct of a civil servant should be regulated."

activities the state is in general not concerned, so long as his conduct therein is not such as to bring discredit upon the service of which he is a member. But to say that he is not to subordinate his duty to his private interests, nor to make use of his official position to further those interests, is to say no more than that he must behave with common honesty. The service exacts from itself a higher standard, because it recognises that the state is entitled to demand that its servants shall not only be honest in fact, but beyond the reach of suspicion of dishonesty. It was laid down by one of His Majesty's Judges in a case some few years ago that it was not merely of some importance but of fundamental importance that in a Court of Law justice should not only be done, but should manifestly and undoubtedly be seen to be done; which we take to mean that public confidence in the administration of justice would be shaken if the least suspicion, however ill-founded, were allowed to arise that the course of legal proceedings could in any way be influenced by improper motives. We apply without hesitation an analogous rule to other branches of the public service. A civil servant is not to subordinate his duty to his private interests; but neither is he to put himself in a position where his duty and his interests conflict. He is not to make use of his official position to further those interests; but neither is he so to order his private affairs as to allow the suspicion to arise that a trust has been abused or a confidence betrayed. These obligations are, we do not doubt, universally recognised throughout the whole of the service; if it were otherwise, its public credit would be diminished and its usefulness to the state impaired.

It follows that there are spheres of activity legitimately open to the ordinary citizens in which the civil servant can play no part or only a limited part. He is not to indulge in political or party controversy lest by so doing he should appear no longer the disinterested adviser of Ministers or able impartially to execute their policy. He is bound to maintain a proper reticence in discussing public affairs and more particularly those with which his own Department is concerned. And lastly his position clearly imposes upon him restrictions in matters of commerce and business from which the ordinary citizen is free.

We content ourselves with laying down these general principles, which we do not seek to elaborate into any detailed code, if only for the reason that their application must necessarily vary according to the position, the Department

and the work of the civil servant concerned. Practical rules for the guidance of social conduct depend also as much upon the instinct and perception of the individual as upon cast-iron formulae; and the surest guide will, we hope, always be found in the nice and jealous honour of civil servants themselves. The public expects from them a standard of integrity and conduct not only inflexible but fastidious, and has not been disappointed in the past. We are confident that we are expressing the view of the Service when we say that the public have a right to expect that standard, and that it is the duty of the Service to see that the expectation is fulfilled.

The general rule necessarily holds good in every case where a special art or craft is pursued. Discipline is severe in proportion to the excellence of attainment sincerely desired. Bernard Shaw does not drink tea, coffee, or alcoholic liquors, mainly because he is loyal to his craft: has he not said that without them he kills nine out of ten thoughts, but having consumed them he loses the power of self-criticism? The most splendid code of systematic self-discipline is the Book of Spiritual Exercises made by Ignatius Loyola for the Jesuit Order. The novice passes twenty-eight days in devotional retirement. In this seclusion he is humiliated by the memory of his past life and troubled with a vision of future labors and sacrifices. He then learns the life and works of Christ, and chooses the specific path upon which he thinks to tread toward the divinely appointed goal. He is helped to enter into the spirit of the way of salvation made known by the Saviour; and before the resplendent light of this revelation, the novice annihilates his average nature and surrenders for ever to the commands and prohibitions adequate to the duties which he has now come to expect of himself. Each day starts with prayer, and then a *prelude*, that is, a strenuous imaginative evocation of men and places, or his personal vices, which he will be called upon to master during the day. He must obey the dictates of his preconception. Then (and on each day there is a different routine) he traverses a number of spiritual stations; surveys his sins and meditates

upon their despicable baseness; reflects upon the distance of his fall from the possible maximum of human saintliness; and from the high morality of God, meditates upon, and even cries aloud, his worthlessness compared with the Lord's unbounded loving-kindness; vows that he will embrace the means of amendment, and repeats the Lord's Prayer. A ritual of penitence, all military in its qualities of discipline and subordination to the command of the former cavalry officer, Loyola, was prescribed, and it recalled in terms calculated to rouse the martial spirit, the eternal battle between Wrong and Right.

More modern and ordinary instances abound. An Olympic runner is made by careful diet, proper spells of rest, and disciplined exercise. A boxer suffers terribly during training; similarly with dancers, painters, and writers. They discipline their talents.

The ordinary, average worker is kept to this intensity of training, this carefulness of life, is kept "in form" by the prospects of advancement or of losing his job and by many other things which operate equally in the civil service as, for example, the opinion of his friends and the sneers of his enemies, a pure sense of self-respect, and so on.<sup>56</sup> The security of tenure, the collegueship, the monopoly of unpriced services, reduce the strain and tautness and severity of the service of the state, and a deliberately invented and consciously inspired code of discipline is the necessary basis of progress. The desire for excellence of attainment must, if it is not spontaneous, be synthetically fabricated. Whereas in private employment the price of service in large part evokes obligations and restraints, in public employment the obligations and restraints which serve the public are not in strict proportion to the price paid to civil servants.

In some countries a note of religious solemnity is introduced into the whole arrangement by the institution of an oath

which civil servants take when entering the service. In bygone days such oaths were personal, that is, they were made to the Prince, King, or Emperor,<sup>56</sup> and it was to the personal service of these that the olden-day Chancellor, Marshal, and other officers swore devotion. The transformation of the royal State into the impersonal state has resulted in the oath being taken to the laws and the constitution. For these continue, or lawyers are prepared to demonstrate that they continue, though Presidents, Prime Ministers, and party leaders come and go. Weimar German officials had to "swear loyalty to the *Reich* constitution, obedience to the laws, and conscientious fulfillment of my official duties."<sup>57</sup>

*The Obligations of Public Service.* Supposing now that the present tendency toward maintaining state activity continues, that the state socializes: that is, manages a large part of the total economic activities to the exclusion of the present price- and profit-making machinery. Suppose it discards for the great basic neces-

<sup>56</sup> E.g., the oath in the fifteenth century (in Prussia) was to the immediate master: to him was sworn faithful service, the care of his interests and those of the country, the prompt and careful execution of all official duties as well as the special orders of the master, and finally, the strict keeping of official secrets and other confidential information made by the master. (S. Isaacsohn, *Geschichte des preussischen Beamtentums*, Vol. I, p. 7.)

<sup>57</sup> Cf. constitution, 1919, article 176.

*France:* Under Napoleon as Emperor, civil servants swore obedience to the constitution and to the Emperor; this form remained until September, 1870, when the oath of service was suppressed. But Jèze says that the professional oath still exists. He condemns it, saying it is puerile, because a magistrate or a teacher will serve loyally in any case. "In fact, it is a practical and theatrical means of fulfilling the official ceremony of installing a public officer. It has no legal significance. The oath adds absolutely nothing to the service duties of the official." (Jèze, *op. cit.*, Vol. II, p. 94).

*Great Britain:* No oath. *United States:* No oath, but the TVA statute requires [Sec. 2(h)] that all members of the board shall be persons who profess a belief in the feasibility and wisdom of this act. The Authority requires this profession of all its employees. The requirement had its origin in the anxiety that enemies of public enterprise would thwart the TVA from within.

<sup>58</sup> Cf. Carl F. Taeusch, *Professional and Business Ethics* (New York, 1926).

## PROBLEMS WHICH ARISE AFTER RECRUITMENT

saries the principle of price for the principle of the best quality and greatest quantity to him who needs most, or even the principle of equal distribution? If the ordinary economic motives as they now operate are devitalized by the state provision of secure economic conditions, what principle of behavior must be put in their place to serve such a philanthropic state? If nationalized services are to operate with the maximum of beneficial effect and the minimum waste of energy and resources, it is not enough that they are manned by millions of civil servants who know how to go about their business, acting in an ingeniously-planned organization. A faith must animate and sustain them in the use of that knowledge, a faith akin in its steadfastness and compelling attraction to that which moves great scientific, intellectual, and artistic natures. They must believe that their work and their surrender of easy satisfactions and daily indulgences are worth while.

A dynamic ethic is above all necessary, an insistent commandment, an unfailing "Thou Shalt" and "Thou Shalt Not." This ethic can have an enduring effect only if it is based on a deliberately inculcated scheme of beliefs about the debt owed by individual men and women to the society whose service is their purpose, and these beliefs must be held religiously. We have glanced at the present state of those beliefs as included in the codes of discipline of some great modern states. But they merely correspond to a degree of socialization which if it is not small is at least not yet as large as the programs of progressive political parties. Even conservative parties are socializers in the many things they would like to *force* everybody else to do: for conservatism is far from individualistic. It merely asks of the state different activity from that demanded by others; but, emphatically, it asks the state's intervention. If society, then, comes to rely upon the socialized operation of essential industries, its success will depend chiefly upon the quality of mind the civil servant brings to their conduct. And it seems to me that the qual-

ity of mind must fulfil the following conditions.

The civil servant must believe that the public welfare is his sole end, and that he is not entitled to spiritual and material adventures which conflict with this end. He must subdue desires for alternative satisfactions which are incompatible with the public welfare. When all constitutional channels, in the creation of which he will naturally have had a fair say, have been used in regard to his claims for pay, conditions of work, amount of leisure, etc., he must accept the result without that malice, sense of injustice, or revolt which would spoil his work. Since only what best serves the state is best, it is a breach of official faith to show favoritism or jealousy in the course of his official duties on grounds of race, creed, class, sex, family ties, etc. If he receives orders which are unsound, or is reprimanded, as he thinks, unjustly, his sense of obedience must not be weakened, and (without animus) he must honestly state what seems to him unfair and inefficient. The use of his leisure would need to be such as not to unfit him for the best performance of his duties. His inventive faculties must be continually kept at their fullest natural stretch. His imagination must, as far as it can, see through the forms and the oral and written reports to the human realities they represent. The representative assembly and its organs will lay down the limits within which he may act officially, and he owes obedience. Tolerant and kindly to those below him in rank and to the public he serves, he must use his official authority no more than the interests of the service require, and suppress the impulse of personal dominion since his command is held only as a trust for society.

These are austere conditions, and the task of cultivating them in several million administrators drawn from the average men and women we know is fraught with immense difficulty. Indeed, it may be asked, is the task even possible? We shall not attempt to answer that question here, but we may indicate some of the elements into which the inquiry must be resolved. How far is the incentive to make private

profit actually operative in modern industry? How strong are other motives, if present, compared with it? Was private profit the predominant motive when the young men or women first entered employment, or were they attracted by other prospects in their vocation? Would a freer choice of profession modify the desire for harsh competitive economic advantage, and fortify the strength of other mental and spiritual factors, such as delight in speculation, research, organization, handicraft, and so forth, essential to sound progressive industry? How far, in fact, has acquisitiveness been checked in professions and business? If it has been limited by an accepted body of ethics, what general effect has this had upon the behavior of those accepting it? Has there been, for example, much private rebellion against the code—did men “grunt and sweat under a weary life,” and feel that they bore fardels?

For it is urgent to beware that we do not simply remove the human stress and pain from where they are resident in society to another place. Good statecraft is to move and redistribute them so as to reduce their incidence to the minimum possible. And it is all too easy to make mistakes: to create sheer ugliness and moral inhibitions without creating as much or more freedom, beauty, and moral development. Of this, the statesman must beware, and the cost must be anticipated. And, finally, we must ask whether we can possibly devise a system of education for children and adults which will enable us to inculcate the code of discipline—how far can we go along this road of changing the schools, the universities, and the environment, and thereby of subjecting impulses and restraints to our rationally conceived social plans? For the ethics of every profession will be found, on close analysis, to be not much higher and not much lower than the general decency of the nation as a whole. Their nature, at the least, is powerfully molded by the level of the surrounding and pervading civilization.

These are not easy questions to answer. They require an exact and critical re-

search into human nature and the world in which it lives. But whether they are answered before we move into a more socialized or a less state-controlled life than we have now, the good we decide upon will be purchased by a price paid in the currency of such restraints as we observed in the official discipline of today.

These questions are not put with the idea of suggesting that the conditions are impossible of fulfillment. Nor are they expressed in an absolute sense, that is to say, the world is not faced with deciding to have all or nothing of socialization or a planned economy. There may be some branches of enterprise where the conditions can be fulfilled better than in others. There may be partial state control, short of full ownership and management, in which the controllers alone must satisfy the disciplinary conditions, while the rest are free. The full force of the principles regulating duty and incentive in a planned economy may not need to be applied to the general body of the workers under the higher ranks of the executive group, the intermediate foremen level.

What is to be learned, however, is that where the economy, as well as other phases of man's social behavior, is subject to social rule, it must be in the name of certain principles. Those principles can be fulfilled by a persuaded people and convinced officials. In proportion as persuasion and conviction are lacking and it is still ordained to proceed with the policies, then coercion must intervene.<sup>58</sup>

It is, therefore, emphatically evident that the democratic process, whereby no additional activity is assumed by the state and no extra piece of governmental ma-

<sup>58</sup> Here the reader should have in mind the Soviet planned economy, carried through and maintained without popular consent. Cf. A. Baykov, *The Development of the Soviet Economic System* (Cambridge, 1946). Cf. Stalin's speeches in *Leninism* (New York, 1942) regarding the uprooting of the kulaks and the inefficiency of the administration of the planned economy, especially the quality of the products. Cf. also S. and B. Webb, *Soviet Communism* (London, 1935), Part II, Chap. IX, "In Place of Profits," where they ask anxious questions regarding fear as an instrument of managerial control.

## PROBLEMS WHICH ARISE AFTER RECRUITMENT

chinery is set up until it has been thoroughly warranted by open discussion and acceptance, is an essential element in good administration.

### POLITICAL RIGHTS

THE democratic principle has had at least as much influence upon the modern state as the principle of efficiency, and the public services have been powerfully affected by it. But the notion of authority still lies strongly embedded in the organization of the modern civil service, and though the democratic principle has had its influence, its effect is still only in the early stages of evolution. All kinds of motives combine to support the harshness and firmness of the state's authority over its servants, and these motives are grounded in the state's prestige and in its social importance. Decades have been required to bring some mildness into the state's relations with its servants, and the concessions have never been made but with great misgivings by their donors. Legislatures are in fact dreadfully frightened by civil services: *they and society seem to be lost without them and lost with them, and they feel compelled to treat them in a way which has, in the last generation at least, not been tolerated by private employees. We have already in our discussions of discipline traversed some of the reasons for this.*

Political freedom falls broadly into two parts—that which concerns the exercise of the vote and general political activity, and that which concerns candidature for legislative assemblies.

**The Vote and Political Activity.** No countries now forbid civil servants from voting, nor, as a special class, were they so limited in the nineteenth century. The tendency has been rather for civil servants to be especially welcomed as voters, not by the law, but in political practice, because the government in power (in France until 1871 and in Germany until 1918, the Crown's ministers in a mock-constitutional state) and the parties struggling for power have always hoped to influence civil servants to vote for

them. Governments have always had a fairly easy task, especially in France, Germany, and the United States, in intimidating civil servants, and spying on civil servants has served to reveal any recalcitrancy. The importance of these votes in the aggregate can be gauged when we remember that the officials constitute a very substantial proportion of the electorate. We may take it, too, that there are fewer abstentions among civil servants than among other branches of the population. Further, they have, in bureaucratic countries, made very good canvasses. These qualities persisted in Third Republic France; in Germany they were cynically employed until 1918, when a great break was made with the electoral and bureaucratic past. In England the progressive disappearance of patronage and the growth of bribery and corrupt-practices legislation reduced the significance of this use of the civil service vote to a negligible proportion after 1870. In the United States the remnants of the spoils system leave Congressman and the Senator an ample field for ugly election practices in spite of very great progress in the last four decades.

At first, and to some extent even now, the civil service vote was encouraged by the politicians for their own purposes. But as the numbers of the civil service grew, and as its members became ever more aware of their collective economic interests, they became strong enough to threaten to make at least some members of the legislature the servants of their special interests. The threat from some bodies of civil servants, like dockyard workers and postal officials, was strong enough to constitute a problem. The way out of this difficulty was variously proposed as disfranchisement or as the creation of special constituencies.

No great harm has come from leaving matters to take their own course. It is too grave a penalty to debar a civil servant from voting when the result of that voting has, on the whole, so little effect. If civil servants were much more numerous than they are, and if their activities and power were not offset by other

voters and associations, then some other arrangements would need to be made. We shall speculate on this theme later. But the vote has obviously come to stay.

*Political Activity in France.* The extreme of liberty allowed in political activity is to be found in France. But this is not based upon any consciously elaborated political activity at all; it comes about administratively, and is derived from the authority of the minister and the heads of the department to see that the officials do their work properly. Where, therefore, participation at meetings, the employment of time in writing, and canvassing, acting as treasurer, and so on, affect departmental activity, the means of its restriction is part of the ordinary disciplinary arrangements. But the tendency in France has not been generally to forbid or even narrowly to restrict political activity. It has been simply to turn it into "proper" channels: that is to say, to make it support the government of the day, and rid it of anti-patriotic, antimilitaristic, syndicalistic elements, and religious suspects.<sup>59</sup> It has been said <sup>60</sup> that:

The same men who to purify the law of all Catholicism, asserted the indifference of the State to all doctrines, to-day recognize the State's right to have a doctrine; those who negated the soul say that it has the "charge of souls;" those who forbade it to challenge the independence of the mind by any philosophical preference, assign to it the duty of creating "the unity of minds."

The time is past when the personal records were the unfailing registers of political behavior. The jurisprudence of the *Conseil d'État* does not permit use of the disciplinary or promotional power on political grounds, but it denies to the official the right to act outside his work in such a way as to threaten to render inefficient his capacity for serving the

common good as assigned to him in his official duties. He is safeguarded against surreptitious pressure by the *statut*, which declares (article 16) that his *dossier* must not include any mention of his political, philosophic or religious opinions.

*Political Activity in Britain.* British manners and institutions are much different. A comparatively high standard of public honor is combined with more subordination to the public welfare. Long years of electoral experience and efficient party organization have made civil servant canvassers unnecessary, while the tradition of the impartiality of the civil service is a strongly respected convention. Rational consideration has therefore been given to the subject, and a series of rules worked out by the various departments and the Treasury. Generally these allow political activity so long as it is not of a sort to bring the civil servant as an official into such conflict with other citizens that the public service would suffer damage in its dignity, authority, and reputation as an impartial servant of the community. The rules, therefore, affect the combativeness of the civil servant, and his occupation with politics while in official uniform or during his official hours. The Order in Council of 1910 embodied the traditional custom of the service that "employees of the civil service should take no overt part in public political affairs." Examples of departmental rules are the *Clerk's Instructions* of the Board of Inland Revenue which forbid any officer to become secretary of a political association or club, and the Post Office rule forbidding canvassing or other political demonstration while in postal uniform or serving upon a party committee concerned with furthering or preventing the return of a particular candidate.

In 1925 a Treasury Committee considered regulations governing candidature for Parliament and for municipal bodies of persons in the service of the Crown, and its report <sup>61</sup> dealt with political activity and the right of candidature, but

<sup>59</sup> Cf. P. Harmignie, *L'État et ses Agents* (Brussels, 1911), p. 29 ff.; and P. Leroy-Beaulieu, *L'État Moderne et ses Fonctions* (Paris, 1890), p. 81.

<sup>61</sup> Cmd. 2408, 1925.

## PROBLEMS WHICH ARISE AFTER RECRUITMENT

with special and almost exclusive attention to the latter. The committee required the maintenance of restrictions wherever the reputation for impartiality of the civil servant might be jeopardized. The main ground for such restrictions upon candidatures and political activity was this:

The constantly extending disposition of Parliament to entrust the exercise of quasi-judicial duties to executive departments without providing any of the established safeguards operative against judicial excess—such as publicity, right of audience to persons affected, statement of reasons for judgment, right of appeal, and the like—as well as the sharper alignment of political parties in these days, unite to make the high reputation for political impartiality hitherto enjoyed by the public service a more valuable national possession than ever before. We can feel no doubt that the confidence universally held in the existence of such impartiality is a most valuable guarantee for its continuance, and we can have no assurance that the existing ethic of the service would long survive that confidence if it were once lost.

The committee rejected the possibility that an alternative career, that of politics, should be opened up to civil servants. It would take experienced civil servants from the service, and would distract others by aspirations which might fail of realization. They were afraid that a public servant would use his office to help his political career and his political career to improve his official position. They accordingly recommended that participation in municipal government should be still permitted by departmental discretion, where it involved no moral or material interference with official duties. As for parliamentary candidatures, the existing civil service rule—that is, resignation on candidature—was to continue in effect. But the industrial staffs (munitions workers, shipbuilders, etc.) of the fighting services should be exempt. Some members of the committee thought that all industrial staffs and the manipulative and other subordinate grades should be free to pursue candidatures. But even here it was recommended that political activity in official uniform or in the area of serv-

ice should be forbidden. The agreed recommendations were made effective by Order in Council, July 25, 1927. The departments which have local offices and connections with the local authorities prohibit their officials from standing for local councilorship.

Many civil servants, keenly interested citizens, remained restive under these restrictions, and after World War II raised the issue of political freedom anew, at a time when also great changes occurred in political and administrative organization. The most recent ideas are surveyed presently.

*Political Activity in Germany.* Before the advent of democratic government in 1918, the German government mastered the political activity of its servants and saw to it that none save "friends of the Government" or "Fatherland-faithful" citizens became and remained civil servants. The large military element which had the monopoly of the lower clerical and custodial grades was well enough disciplined not to need encouragement to occupy itself with political activity excepting as it pleased the government, that is, the Conservatives; and the upper civil service was in the main by birth and social position the supporter of the government, and those who were heads of the local authorities were the political agents of the government.<sup>62</sup> A long and bitter controversy raged round the position of the heads of the local hierarchy under the name of "the problem of the political officials."

The advent of democracy aggravated the problem. It was especially among the civil servants of executive and clerical rank—always the storm-center of agitation in the civil service—that resentment was felt about political limitations.

The change from monarchy to democracy threw Germany without any preparation into the very midst of all the bristling difficulties of the problem. The first impulse, as soon as parties became all-powerful, was for each party to use

<sup>62</sup> See H. von Gerlach, *Meine Erlebnisse in der Preussischen Verwaltung* (Berlin, 1919); and A. Wermuth, *Ein Beamtenleben* (Berlin).

the civil service for all it was worth as "spoils" and as votes, canvassers, and election agents. Some things—some necessary—were done in the early months of the Revolution.<sup>63</sup> Then the constitutional assemblies of the *Reich* and the states set to work and produced the elements of a code. The main features in the *Reich* and in Prussia emerged from a consideration of article 130 of the constitution of August 11, 1919, and a series of decisions of the Supreme Administrative Court of Prussia. The constitutional clause said:

Officials are servants of the community, not of a party.

All officials are guaranteed freedom of their political opinion and the right of association. Officials are accorded special representative committees which will be constituted in detail by a law of the *Reich*.

We are here principally concerned with the second clause of this article—on the freedom of political opinion. This, when taken together with article 118, which gave all citizens the right to express their opinions freely but within the limits of the general law,<sup>64</sup> meant that the official was without any constitutional limits upon his political activity. But these constitutional rights were abrogated to the extent made necessary by the nature of their office.<sup>65</sup> This is a very good illustration of the argument sustained in the previous section on disciplinary codes and the need for an

official ethic. The constitutional rights of civil servants are limited by more than the general criminal law; they are not like ordinary people. These limits did not go so far as to exclude officials from the franchise, or to require that they should change their political party because it happened to have a point of view different from the government of the day. But officials must be held in check by remembering that their behavior might affect the belief in the impartiality of their official function. No admixture of official and political activity was permissible. Nor might any official superior use his authority to influence the political opinion and activity of those under his control. Officials were forbidden to use their official or social power to influence votes, and all political agitation in official precincts was strictly forbidden. The Supreme Administrative Court of Prussia decided that "freedom of political opinion" meant that any official might openly proclaim himself member of a political party, and that against this simple declaration no disciplinary action could be taken. Cases, however, arose where officials wore party symbols, like swastikas and Soviet stars, buttons, and badges, and since experience showed that these resulted in undesirable altercations and a disturbance of the peaceful continuity of official work, the exhibition of symbols during service was completely forbidden.

The penal code<sup>66</sup> forbade all officials, without exception, to promote or support, by positive activity, the efforts of political parties who wished to abolish the bases of the existing republican forms of the state by violence—as, for example, the Communist party or the Separatists. An official, for example, who participated in the formation of a "red army" had to be dismissed.<sup>67</sup> Behavior of this kind naturally was against the oath of office. The law on the Defense of the Republic<sup>68</sup> of July, 1922, which has been inserted into the *Reich* law relating to

<sup>63</sup> Von Gerlach, *op. cit.*

<sup>64</sup> I.e., the criminal law relating to libel and slander, etc.

<sup>65</sup> Cf. Brand, *op. cit.*, p. 486. The Prussian *Oberverwaltungsgericht* (1927) laid down very strong doctrine: "The right to freedom of opinion is no unlimited one, but finds its limits for every citizen in the general laws, and for the official further in the duties imposed on him by his duties, principally in the duty of obedience and loyalty, which forbids him from making a use of this right as unlimited as other citizens who are not under the compulsion of the unrelaxable official discipline in the general public interest. The office includes the whole of the official's personality. He is never a mere private citizen: in all his actions, even outside his office in the narrowest sense of the word, he must know and remember that his office binds him."

## PROBLEMS WHICH ARISE AFTER RECRUITMENT

federal officials, also imposes special duties upon them. They could not in public and during their functions promote movements for the restoration of the monarchy or against the existence of the Republic, by the misuse of their official status or by incitement or spiteful behavior, nor support such movements by calumniating, defaming, or bringing into contempt the Republic, the President of the *Reich*, or members of the present or a previous republican-parliamentary government of the *Reich* or any state.<sup>69</sup>

The administrative courts worked out the effect of the official duties upon constitutional rights in considerable detail. Where officials in the course of their political activity criticized the government, they were expected to endeavor to exercise the rights in a peaceful and a technically impersonal fashion. They could not fight the government either publicly or privately in a manner designed to stir up hatred, or agitate, or incite. What happens inside the service was not to be made known to outsiders not directly interested. Complaints about superiors might not even be published in a service journal. Officials were obliged to be very careful not to defame their superiors, or to engender dissatisfaction among officials and jeopardize the discipline and order of the civil service.

Thus the political activity of civil servants in Weimar Germany was limited. Civil servants could act and speak politically, but all in a muted key. It should be noticed that in Germany some of the officials were definitely political officials:<sup>70</sup> that is, their position was such that they had wide discretion in the execution of the plans of the central government; they shared, indeed, in the work of government in a very real sense, being in close and intimate contact with

ministers and sharing their confidence. These could not, under any circumstances, work against the government of the day, and were not allowed to attempt to criticize ministerial plans or projects in public.

On the whole, the Weimar Germans worked out a rational system, not too hard upon the civil servants and not dangerous or derogatory to the authority of the state. The interests of any state are in the maintenance of its authority, and this is based upon its spiritual awfulness and its temporal dignity and efficiency. The limitations upon the civil servants are designed to safeguard these qualities, in all their possible entirety, from the effects of unrestrained democracy. These limitations ought not to be drawn too narrowly since too sharp a differentiation between officials and public is bad for both. Everything which can make for community of life and understanding of governors and governed is important. The mistake to be guarded against is that of being unjustly restrictive to the official.

*Political Activity in the United States.* This, owing to an unfortunate administrative history, the United States has not been able to avoid, and her present law and regulations are rather of the nature of an undue reaction from the blatant evils of the "spoils" system than a rational settlement of the problem of political activity.<sup>71</sup> The Civil Service Act of 1883 gives the Civil Service Commission power to aid the President in preparing suitable rules for the civil service, and the rule which appears first in the body promulgated by the President runs:

No person in the executive civil service shall use his official authority or influence for the purpose of interfering with an election or affecting the results thereof. Persons who by the provisions of these rules are in the competitive classified service, while retaining the right to vote as they please and to express

<sup>69</sup> Cf. also G. Anschütz, *Beamten und die Revolutionären Parteien* (Berlin, 1931).

<sup>70</sup> These were classified in an order made by the *Reich* Ministry of Justice, 16.2.23, *Reichsjustizministerium*; cf. *Beamten-Archiv*, Vol. III, p. 322. The best general treatise upon the subject since 1919 is A. Köttgen, *Das deutsche Berufsbeamtenum und die parlamentarische Demokratie* (Berlin, 1928).

<sup>71</sup> The same may be said of Australia, Canada, and South Africa, and the regulations of these countries are almost identical with those of the United States. For the United States, see W. Chen, *Doctrine of Civil Service Neutrality in the United States and Great Britain* (University of Chicago Ph.D. thesis, mss., 1937).

## POLITICAL RIGHTS

privately their opinions on all political subjects, shall take no active part in political management or in political campaigns.

This provision is supplemented by the rule prohibiting political assessments, that is, the raising of funds for political purposes by more or less enforced contributions from civil servants.<sup>72</sup> It is extended in various ways by the Hatch Act.<sup>73</sup>

Candidatures for political conventions in the capacity of delegate, or service as an officer or employee thereof, are prohibited. Attendance is permitted, but not participation in the proceedings in any shape, nor public display of partisanship or obtrusive demonstration or interference. It is permissible to cast a vote at primaries, mass conventions, or caucuses, but not to go beyond this point, whether as an officer of the meeting, as a speaker, or even to take a prominent part in the proceedings. Preparing for, addressing, or organizing or conducting a political meeting or rally is not permitted. Nor is service on any political committee allowed. Even attendance at committees which are distinctly related to government policy at a time when campaigns are in progress may fall within the ban. It is permissible for civil servants to be members of political clubs, but not to be active in organizing them, or in making addresses to them, or to be officers within their framework. It is even dangerous to hold office in organizations established to secure social reforms, as they may take on a character of partisan political activity. There might even be a question asked where the more technical aspects of governmental reform were the object of some civic organization's program. It is permissible to make gifts of money or kind to political organizations, but they may not solicit, collect, receive, disburse, or otherwise handle contributions for political purposes. No such contributions

may be made directly or indirectly to secure the election of members of Congress.

Although employees may express their opinions on all political subjects and candidates, such expression may not occur in such a way as to constitute an active part in political management of campaigns. While an employee may wear a political badge or display a poster in his window or car, it is a violation of the law to make this into a partisan display while on duty.

The management of newspapers or editorial service thereon, where they are known as partisan, is prohibited; any kind of publication for or against parties, candidates, or factions is prohibited. Practically every kind of activity at the polls is prohibited, excepting the right to vote. Though the right of petition is safeguarded, if petitions are identified with political management or campaigns, the civil servant may not initiate them or canvass for their signature.

All these rules are interpreted in detail and quite strictly—at any rate, in theory. There are additional rules prohibiting the interference with the political freedom of any civil servant by other civil servants or by outsiders through the offer or refusal of jobs or promotions or dismissals, and so on, for political purposes.

These restrictions are exceedingly heavy: certainly in their overt completeness far more so than those in Britain and France. There are others concerning the holding of office in legislative assemblies, and even more important, being members of organizations whose political activities and general philosophy are disliked—such as fascist and communist groups. To this subject we return presently. It may be added that one of the bans on membership of political organizations related to affiliation with those that advocate strikes, and this also needs separate discussion later.

The action taken by the Civil Service Commission against offenders is displayed annually in its report.

*Political Candidatures.* Neither Great Britain nor the United States allows political candidatures of civil servants. The

<sup>72</sup> Criminal Code, Section 118 ff.

<sup>73</sup> Public Law, No. 252, August 2, 1939; amended July 19, 1940, and March 27, 1942. Cf. Civil Service Commission Form 3726, June, 1942, *Political Actions of Public Officers and Employees*.

## PROBLEMS WHICH ARISE AFTER RECRUITMENT

early practice of the former was dictated by the fear that the executive would dominate Parliament at a time when the Crown and ministers showed every sign of desiring such domination. That fear has departed, but before it lost its efficacy it resulted in the theory of the separation of powers and its inscription in the constitution of the United States and most of the American states.<sup>74</sup> The present situation, which is very much the same for Australia and Canada, is dictated by the fear that the civil service would lose its reputation for impartiality if civil servants were allowed freely to become candidates and participate in the work of political assemblies. We have already (p. 86g) quoted a passage from the report of the British Treasury Committee which reported upon this subject—impartiality is its theme. But there are other difficulties. The civil servant who becomes a member of a legislature might find it necessary to criticize his former chiefs, political and administrative, and to say things about his department which would breed a very ugly spirit in his office. How could he, then, at the expiration of his term, be reinstated without disturbance and personal friction? An alternative career would be created for some, and this would take their minds from their work; while the possibility of their translation to another sphere would cause all kinds of emotional disturbance among their colleagues and those seeking promotion. There is the further difficulty of their status in the department when they return from their parliamentary activities. All these and many more possibilities are not of such a nature that their importance can be gauged with any exactitude; we have no data upon which to judge how many people would be affected

with the desire to be candidates, and how many adjustments would have to be made through their alarms and excursions. But a fear remains. The general practice of English-speaking countries is, then, to exclude candidatures for the legislature.

The higher officials in Great Britain who are, by the nature of their duties, continually dabbling in politics, have not insisted on their claims. The subordinate officials have pointed out that officers of the armed forces had the right to enter Parliament. Dockyard workers, too, were in a condition of freedom in this respect.<sup>75</sup> Postal and customs officials, however, and the clerical and administrative staffs were obliged to follow the rule (by clause 16 of the Orders in Council of 1910) that "any officer seeking a seat in the House of Commons shall resign his office as soon as he issues his address to the electors, or in any other manner publicly announces himself as a candidate." The Treasury declaration first supporting this rule was made in 1884, and said that there would be public injury caused

by any departure from the conditions which, under Parliamentary Government, render a Permanent Civil Service possible, and . . . among those conditions the essential one is that the members of such a service should remain free to serve the Government of the day, without necessarily exposing themselves to public charges of inconsistency or insincerity.

The reply of civil servants<sup>76</sup> is that they ought to take as keen an interest and as controversial a part in politics as any other citizen. This does not impair their loyalty in administering a contrary policy, "and in place of the existing restrictions on the expression of those views all that was required was a code of professional discretion such as that expected of barristers and solicitors." They rely upon a "professional ethic." The committee sustained the Treasury's opinion. Resignation on candidature is the civil service

<sup>74</sup> Constitution, article I, sect. 7: "No senator or representative shall, during the time for which he was elected, be appointed to any civil office under the authority of the United States, which shall have been created, or the emoluments whereof shall have been increased during such time; and no person holding any office under the United States shall be a member of either House during his continuance in office."

<sup>75</sup> See Report of Committee on the Parliamentary, etc., Candidature of Crown Servants, Cmd. 2408, 1925.

<sup>76</sup> Report, p. 14.

rule in regard to Parliamentary candidatures.

France and Germany have a different history in this matter of political candidature of civil servants. In France up to 1852 there was a general tradition and practice of membership of the Chamber and the Senate by officials, until great abuses, both administrative and political, arose.<sup>77</sup> From 1852 dates the constitutional principle that every paid public office is incompatible with the mandate of deputy to the legislative body. In 1875 this general rule was adopted<sup>78</sup> and even a list of exceptions kept the ordinary civil servant from the Chambers. Since 1919<sup>79</sup> if an official is elected to a legislative body he ceases for the time being to be an official, since office and membership are incompatible, but does not lose pension rights.

In Germany<sup>80</sup> before the Weimar régime, neither the *Reich* nor the states excluded officials from Parliamentary candidature and activity, and indeed, since the beginning of constitutional government in those states, special guarantees were created so that this activity might be unhindered. Later, under the kind of constitutional government pertaining before 1918, the difficulties of the double nature of the official, as official and private citizen, did not appear in all their severity. For the government excluded from its service all but those likely to be its friends, and political parties had no very effective part in constitutional life. It was even to the interest of the government to have its well-disciplined civil servants in the political assemblies as representatives of its point of view, as experts upon the subjects discussed, espe-

cially in committee, and as an addition to governmental voting power.

Prior to the advent of constitutional government, that is, under the despotism of the eighteenth century and its limited counterpart to 1848, the "people" found it rather to their interests to have officials included in the estates and other representative bodies, since they were able and since they were occasionally in the van of political liberalism, and as such a counterweight to the influence of court favorites. During the March days of 1848, liberal opinion, following the constitutional development of France, England and the United States, tended to demand the exclusion of officials from the assemblies. But other currents of opinion resisted, and the end was the maintenance of unlimited freedom of entry into Parliament, and of the rules which had previously been made to secure that officials should not find themselves dismissed for their ambitions or even experience undue hardship in obtaining leave (*Urlaub*) to which they had a statutory right.<sup>81</sup> Until the entry into force of the constitution of 1919, the situation in the *Reich* and Prussia, and almost all other states with small variations, was that all officials had unconditional freedom to participate in parliamentary and local government;<sup>82</sup> they obtained leave automatically upon election. This leave extended to the full session of the assembly and to short adjournments, but not to long prorogations. Officials were secured by special regulations against having to pay the cost of departmental deputies out of their salaries. In support of the existing situation were those considerations: the technical ability of officials, the loss to the dignity of the service if they were denied the free expression of opinion, and the value of their impartiality in assemblies

<sup>77</sup> Cf. E. Pierre, *Traité de Droit Politique et Parlementaire*, 5th edition (Paris. 1924), para. 337.

<sup>78</sup> Law, November 30, 1875, article 8: "The exercise of public office paid out of State moneys is incompatible with the mandate of deputy."

<sup>79</sup> By the combined effect of the law of December 30, 1913, article 33, and the law of October 21, 1919.

<sup>80</sup> The history of the German law and practice is very ably described in Clausz, *Der Staatsbeamte als Abgeordneter* (Karlsruhe, 1906).

<sup>81</sup> The constitutional assembly of the North German Confederation, 1867, consisted of 40 per cent of active civil servants, and the same proportion appeared in the Prussian Diet. In 1867, thirty per cent of the German *Reichstag* were active officials; in 1898-99, fifteen per cent. It must be remembered that judges and teachers were included in these percentages.

<sup>82</sup> Cf. constitution, 1871, article 21.

## PROBLEMS WHICH ARISE AFTER RECRUITMENT

which were more and more becoming a prey to violent economic and social conflicts. Against the right of candidature were the difficulties felt by the officials in combining office with party activity, the disorganization caused by sudden departures without leave and without proper arrangements previously made, and, from the point of view of the public and the parties of the Left, the increase of government influence by the activity and votes of parliamentary civil servants.<sup>83</sup>

The new constitution reiterated on the whole the freedom of political candidature. Article 128 gave "all citizens without distinction" the right to participate in public office, "in the measure allowed by the laws and in correspondence with their competence and services." Then article 39<sup>84</sup> said: "Officials and members of the armed forces need no leave for the exercise of their office as members for the *Reichstag* or state Diet." This part of article 39 was word for word the same as article 21 of the constitution of 1871. But the second part introduced a novelty which was a significant extension of the right of free candidature. "If they attempt to acquire a seat in these bodies, then they must be granted the leave necessary for preparations for the election." The precise meaning of the word "necessary" (*erforderlich*) was left to the head of the department. No such leave preparatory to elections for the local authorities can be obtained, as it was thought that this would result in frivolous candidatures for the mere purpose of obtaining a holiday.

Germany had a very different problem to solve in the matter of political candidatures and activity, for her political system before World War I was radically different, both constitutionally and administratively, from the Weimar organization. The country assumed the democratic

method at a time when it was under serious and valid criticism, in spite of its many good features. Germany was badly scared by the rapid succession of short-lived governments and the instability of political life in the great states of today, and was especially anxious about the chronic defectiveness of French parliamentarism which had never been able to create an independent and efficient civil service. It was an act of great political bravery to dare the possible effects of democratic government upon the administrative system, but this was done. The result was that Weimar Germany was the most liberal country in the world in her interpretation of the rights of officials to participate in political life.

The Law of Officials under the Constitution of the Western Zones (1949) abolished the right of civil servants to run for legislative office.

### SOME CONCLUSIONS ON POLITICAL RIGHTS AND DUTIES

ON the whole, then, civil servants are under strict prohibitions regarding the use of the civic rights available to all citizens. How far is this just? The answer is suggested by a consideration of three questions: the fundamental importance of impartiality and continuity of the public services, the situation as it is affected by the growth in the size and scope of state services, and finally, the rather wider issue of general loyalty to the entire political regime.

*Impartiality and Continuity.* Unwillingness to give officials any extensive political freedom is not due to mere caprice; it is due to the recognition, sometimes clear, sometimes vague, of the profound public importance of impartiality in the civil service—and it is a widespread and insistent recognition. We have seen this purpose immanent in the whole range of political activities—the state must not be injured, it must go on. Whatever the changes in the political constellation, however great the shocks in the world of political conflict and however violent its revolutions, the state, which is certainty,

<sup>83</sup> Clausz, *op. cit.*, p. 186 ff.

<sup>84</sup> Cf. also article 11 of the Prussian constitution: "State officials, employees and workers, and corporations of public law need no permission to exercise the activity of a member of Parliament. If they become candidates for the *Landtag*, the necessary time for preparation for their election is to be given. They continue to be paid their salaries and wages."

regularity, order, must continue. It must not cease: cessation is mortal. The instrument of continuity of services, which *ex hypothesi* are vital, is the civil service. Conceive the social and economic loss in modern Britain or France or Germany or the United States if the administrative services were the sport of political parties—the waste of organization, technique, expertness, professional zeal, and the adaptation which comes of years of regular and uninterrupted devotion to duties! All parties in the state must be sure of a highly efficient instrument, however diverse their policies, for no policy is worth the paper it is written on unless there is executive force behind it. Parties may differ on all things, but one thing is their common desire: power when they are in office, and such power is executive power. Our chief hope that political ministers and a helpless public will be prepared to learn from real science, resides in the flawless impartiality of their experts; and only the fact will create the confidence in it.

It is not surprising, therefore, that Weimar Germany inscribed official impartiality or neutrality into her constitution; that France has moved towards such a condition; that the Anglo-Saxon countries above all have created stringent prohibitions designed to serve political neutrality. The Anglo-Saxon countries are rightly afraid of their former selves. The question is whether in the present condition of acute political conflict in modern times this important constitutional rule can be maintained. For the more severe the struggle, the greater the temptation to use every means, legitimate or illegitimate, noble or base, to secure political advantage, that is, to win power over the adversary. In Great Britain, so far, the staff has been ready to serve any whom the elections and Parliament designated as the government. It is generally believed that this readiness will permanently prevail. This contention was well supported by the severe test of the Labour party's various tenures of office.

In the first edition of this work in 1932 I said:

It should, however, be said that at no time in English political history have these qualities of neutrality been subjected to a really crucial test. We have yet to see whether civil service neutrality can be maintained if burdened with any vital problem of conscience. We must not be too sanguine that our future is likely to be as free of social cleavage as our past. It should be remembered that during the General Strike of 1926, a large number of civil servants would not, on conscientious grounds, volunteer for duties outside those for which they were expressly engaged. Feelings were roused to a pitch where numbers of civil servants seceded from their association because they thought it had taken up a "disloyal" attitude. There are times, in fact, when the policy of a government directly affects the vital nature of the state. We should be foolish to imagine that old habits will continue to rule in such trying days. France is a chronic sufferer from official partiality—or at least, politicians pretend so. Excellent old civil servants in Germany attempted to sabotage the Revolution of 1918, and went a long way towards accomplishing their aim;<sup>83</sup> and even today the irreconcilability of parties produces a state of suspicion in which capable servants are obliged to leave. Yet the sense of service of the state made the civil service the saviors of Germany in the Revolution. It will be noticed that Germany in its "political" officials, France by political undersecretaries and occasional favoritism, and the United States by the number of offices of high administrative rank which may still be included in "spoils," have allowed themselves a safety-valve—official neutrality is not expected of them; indeed, the opposite is re-

<sup>83</sup> F. Giese, in *Das Beamtentum im deutschen Volksstaat* (Berlin, 1924) argued that civil servants ought to take the same attitude towards their service as Frederick the Great to the state—they held their powers, not for personal enjoyment, but as first servants of the state. Further, the service relationship is not to any personal superiors or masters, but to the state. "If this, the only right constitutional view, had been a common possession of the German civil service, then fewer officials would have fallen into so difficult a conflict of consciences on the fall of the monarchy and the entry of the Republican ministers; since they felt obliged to their imperial or royal masters, instead of, properly, to the Empire or their state, many believed that they might not recognize any other institution as official chiefs, although the new institutions embodied no other than the real and hitherto existent chief of the service, namely, the state." Cf. also E. Kleinstück, *Vom Wesen des deutschen Beamtentums* (Berlin, 1927), p. 30.

## PROBLEMS WHICH ARISE AFTER RECRUITMENT

quired, and appointments take place to secure the subservience of these officials to those who appoint them. We shall not press this analysis any further, excepting to say that this impartiality will depend for its efficiency in the future more and more upon the deliberate training of officials to this end. We recall the opinions about official education expressed in Germany. *It will be remembered that various writers insisted on the need for such a training in the social services that civil servants would be qualified to take a nonparty view, a view transcending parties: as one writer had it, they represent "the integrity of pure state mentality," another, "they serve the common good."* [This is extravagant and impossible.]

The supreme importance of impartial service and counsel rendered by the civil servant to the political chief has already received some treatment.<sup>86</sup> It requires further consideration at this point, for it is bound up with the problem of political activity, since political activity which seems to attain the administrative impartiality of the official renders him suspect to political leaders of the opposite side.

If the belief in political impartiality or neutrality of tendered advice and execution of commands should be shaken, we should be faced with the social tragedy that the political chiefs—who are unskilled and casual workers—would hesitate to accept the skilled aid of the permanent experts. They would be tempted to remove those they distrusted and put their own "experts" in their place. They would deny the value and possibility of the existence of objective science, natural, social, economic or administrative, and deprive the state, that is everyone, by depriving themselves, of all the benefits of knowledge from which the sepsis of partisanship has been removed. The case of Mr. Lilienthal and the Senate's hesitations to appoint him to the chairmanship of the United States Atomic Energy Commission, some Senator's attempt to have the FBI investigate that Commission for them,<sup>87</sup> and also the attacks on Dr. Condon of the United States Bureau of Stand-

ards, are indications of the serious possibilities. Political chiefs might use "Left" science or "Right" science, but not plain science; and the public welfare would be surrendered to wishful thinking.

If the public servant were a mere automaton, the problem would be easy of resolution. But it happens that he is human. Nor is that all. The relationship between official and political chief is a delicate and complicated one. More is required from the official than a dry memorandum, and a take-it-or-leave-it. His independence of mind as an official adviser is safeguarded by his loss of full political independence as a citizen. And his independence of mind is sorely needed. The view generally held in all civil services (as shown in Byrnes's statement, p. 865) is that the civil servant has a duty to press his views on his political chief: not to domineer, but to advise with force, and not too easily to desist. This principle was thus expressed in a British official document:<sup>88</sup>

Determination of policy is the function of ministers, and once a policy is determined it is the unquestioned and unquestionable business of the civil servant to strive to carry out that policy with precisely the same energy and precisely the same good will whether he agrees with it or not. That is axiomatic and will never be in dispute. At the same time it is the traditional duty of civil servants, while decisions are being formulated, to make available to their political chiefs all the information and experience at their disposal, and to do this without fear or favor, irrespective of whether the advice thus tendered may accord or not with the minister's initial view. The presentation to the minister of relevant facts, the ascertainment and marshalling of which may often call into play the whole organization of a department, demands of the civil servant the greatest care. The presentation of inferences from the facts equally demands from him all the wisdom and all the detachment he can command. The preservation of integrity, fearlessness and independence of thought and utterance in their private communion with ministers of the experienced officials selected to fill the top posts in the service is an essential principle in enlightened government, as—whether or not

<sup>86</sup> See p. 614 ff. above.

<sup>87</sup> Cf. for example, Truman's resistance in his veto message on Senate Bill 1004, *Congressional Record*, May 15, 1948.

<sup>88</sup> Tomlin Commission, *Minutes of Evidence*, p. 1268.

ministers can accept advice thus frankly placed at their disposal, and acceptance or rejection of such advice is exclusively a matter for their judgment—it enables him to be assured that their decisions are reached only after the relevant facts and the various considerations have so far as the machinery of government can secure, been definitely brought before their minds.

Now men are very sensitive about high policy and the nature of the state, or in other words the interventions into their natural freedom made by others through the supreme force acquired in the name of the community. Their happiness is in issue, their years may be subjected to the domination of other people, their lives may be cut short. They are rightly sensitive about the ends and means of social authority. They will cast the conventions of official neutrality and anonymity to the winds if they find that these are being misused or cannot be relied on. It was never easy to establish these principles. It has taken over a century in each democracy, and there are unwitting and corrupt enemies ready to overthrow these achievements of civilization. It is, then, a nice problem at any given moment to weigh whether the principles have become firmly enough established in the public mind and part of the structure of the mind of officials, that the time-honored buttresses—the rules against political activity—can be dismantled. The answer must differ in each society, for not all are on exactly the same level of public spirit, political maturity, social equanimity.

*The Effect of Growth of the Public Services.* A point of time comes in the modern state when two facts exert a strong influence on the answer to the problem raised here. One is the growth in the number of civil servants in the direct employ of the state, and the other, a very probable accompaniment, is the assumption by the state of power over industries through the mechanism of public corporations. If the public services in the former began to reach the proportion of more, let us say, than one in five of all the families in the nation, would it still be tenable to deprive civil servants

of their political rights? It must be remembered that all civil services that forbid certain political practices to their officials also prescribe that they may not undertake such activities through their families either. If rights were limited, then a very important part of the dynamic, creative element in the nation is sterilized. This could not be afforded, as it would be a sheer loss of brains and character; and in all aspects of the democratic principle and its benefits it would not be right.

Now, it may happen—it has happened in Britain—that in order to avoid the rigidity of traditional administrative methods, including civil service recruiting by wholesale examinations, nationalized industries have been organized as public corporations. They have hundreds of thousands—perhaps millions—of employees. These serve the state; they are even under the supreme, ultimate direction of the government as to general policy. Why should they be free, as they are, of political restrictions and the regular civil servants not? Why are they free? Because it is recognized even without argument that so many citizens ought not to be limited in their political liberties: it is repugnant to good sense.

Indeed, the civil service staffs of Britain have requested that the whole matter be opened.<sup>89</sup> They have proposed<sup>90</sup> that no civil servant of any grade should be prevented in future from standing for Parliament, and that special leave should be granted, with pay, to prosecute his candidacy. They propose also that for local government office it shall not be required that the civil servant shall ask for previous approval: but that instead he shall merely notify his intention to the head of his department, who may then demur for cause. And, finally, they request the removal of the usual restrictions of serving on political committees, making speeches, canvassing, and so on, and that

<sup>89</sup> Cf. staff side representations, *Whitley Bulletin*, April, 1947, p. 52.

<sup>90</sup> The proposals are reminiscent of New Zealand's practice. Cf. L. Lipson, *Politics of Equality* (Chicago, 1948).

## PROBLEMS WHICH ARISE AFTER RECRUITMENT

civil servants should not in future be under any disability to express political opinions publicly, except under the Official Secrets Act. They use the arguments used in the previous paragraph. They point out that it is difficult to justify a difference between the rights of civil servants and of employees of the public corporations. They argue that the time has come "to rely on the discretion and good sense of civil servants in these matters."

*The General Issue of Loyalty.* When states are threatened in their form of government, they try to make sure that at least they shall have no worry from their officials. These hold special positions of power and trust, and betrayal might mean downfall. We have noticed this in the evolution of the German civil service, and the rules on this in the French civil service. No special regulation of political principles is by law required in the British civil service: the days of the Test Acts and of Catholic disabilities are long over. Prior to 1947, the United States civil service had rules prohibiting membership of certain political associations. The Hatch Act (section 9A) said:

It shall be unlawful for any person employed in any capacity by any agency of the Federal Government, whose compensation, or any part thereof, is paid from funds authorized or appropriated by any act of Congress, to have membership in any political party or organization which advocates the overthrow of our constitutional form of government in the United States.

The Emergency Relief Appropriation Act of July 1, 1941, denied employment to any alien or Communist or member of the Nazi Bund Organization where the salary came from emergency relief funds. So also for posts in the National Youth Administration. In the shadow of World War II, the Civil Service Commission decided not to certify for employment any person when it has been established that he is a member of the Communist Party, the German Bund, or any other Communist, Nazi, or Fascist organization (June 20, 1940). And the act of June 28,

1940, prohibited employment where conviction has been obtained of a wide variety of "subversive" acts, mainly the suborning of members of the armed forces from their duty and the teaching and organizing of movements to overthrow the government of the United States by force.

Then on March 23, 1947<sup>91</sup> President Truman issued an executive order requiring the purging of the government service of employees found to be "disloyal" or "subversive." This has required a general definition of loyalty, has involved the Attorney-General in listing all subversive organizations in the United States, and is aimed at not only members, but "fellow-travelers" of, any "totalitarian, Fascist, Communist, or subversive organization." It involves the checking of the loyalty of all existing officials—some 2,000,000—and of all entrants. To see that no one is done an injustice, each department has instituted a loyalty board, and above them all is a loyalty appeals board, appointed by the President, with a membership (at the time of writing) of highly trustworthy and competent citizens. The action was taken according to the order because

the presence within the Government service of any disloyal or subversive person constitutes a threat to our democratic processes . . . and maximum protection must be afforded the United States against the infiltration of disloyal persons in the ranks of its employees, and equal protection from unfounded accusations of disloyalty must be afforded loyal employees of the Government.

There can be no doubt that this move was dictated by revelations of spying by agents of the Soviet Union, first disclosed by the Report of the Royal Commission (Canada)<sup>92</sup> which investigated the communication to Soviet agents of secret and confidential information, especially relating to the atomic bomb. (Other disturbing facts had been learned about Soviet infiltration in European countries.)

<sup>91</sup> Cf. for documents with discussion, University of Chicago, *Round Table Pamphlet*, No. 51, "Loyalty and Liberty in 1948," January 4, 1948.

<sup>92</sup> June 27, 1948, Ottawa.

## SOME CONCLUSIONS ON POLITICAL RIGHTS AND DUTIES

It cannot be avoided, in a time of international troubles, to safeguard the democratic state, with its generous and easy ways of life, against insidious subversion.<sup>93</sup> Neither Communists nor Fascists nor Nazis have the slightest respect for democratic principles or institutions. Each declared themselves the mortal enemy of the democratic state. Yet the self-restraint implied in definition and legal procedure and appeal is a tribute to the democratic constitutionality of the United States.

Shortly after the subversion of democratic government in Czechoslovakia by its Communist party in February, 1948, the British government established a policy of limiting the freedom of employment in the civil service of members of (or those actively associated with) the Communist or Fascist party or organizations. This consists of making sure that no one so associated as to raise doubts about his or her reliability is employed in connection with the work vital to the security of the state.

The prime minister stated that the measure was a security measure only. He declared: <sup>94</sup>

The State is not concerned with the political views, as such, of its servants, and as far as possible, alternative employment on the wide range of non-secret Government work will be found for those who are deemed for the reason stated to be unsuitable for secret work. It may, however, happen that it is impossible to find suitable employment elsewhere in the civil service with specialist qualifications, and in such cases there may be no alternative to refusal of employment or dismissal.

It will be noticed that the British policy is not as sweeping as the American: its criterion is security, not loyalty, although it must be admitted that the issue of loyalty is bound to arise in border-line cases where overt actions are not by themselves absolutely conclusive. Furthermore, the British scheme does not require the complete survey of all in the service, but will work through secret or public in-

vestigation of suspects. It admits of continued employment, though in posts not vital to security. As a safeguard the government appointed a committee of three former civil servants as a body to which appeal is possible. It conducts an inquiry into cases which the minister finds *prima facie* to require action; its report is in each case available for the minister—though his is the responsibility for any decision. An adequate procedure guarantees that a civil servant charged with disloyalty may easily clear himself of any unfounded charge.

So far, to May, 1949, the government exclude those about whom suspicions are justified from the headquarters staffs of the armed service departments and the Ministry of Supply.

The democracies have unfortunately been forced to learn lessons from the nefarious tactics of fascists, nazis, and communists since 1917. It is well for them that they have learned. It is as certain, even as it is necessary, for the sake of democracy itself, that they will apply the rule of law to make sure that justice is done and not abused.

It would, of course, arouse a deep feeling of injustice if taxpayers suspected that the servants they were paying—and nowadays the proportion of the individual's income which contributes to all forms of state expenditure is remarkably high, being about one fifth on the average in the United States and one third Britain—if the salaried servants were indeed unfaithful to the principle that the majority's opinion shall prevail while each minority is assured of the continuing right to try to turn itself by persuasion into a majority. For that is the principle violated when a civil servant cripples the civil service as an instrument of government, not to mention the damage partisanship does to technical efficiency. Resentment is bound to follow in a society where the civil servant and the public stand to each other in the relationship of paid servant and employer. In a well-ordered society where massive benefits and rights are interlaced and well-balanced with duties, licentious criticism

<sup>93</sup> Cf. Herman Finer, *America's Destiny* (New York, 1947), Chaps. VIII-XII.

<sup>94</sup> House of Commons, Debates, March 15 and March 25, 1948.

cannot be allowed. Opposition must flow through well-regulated channels and must not threaten certain fundamental tenets and hardly the constitution by unconstitutional means. The more benefits we wish to take for granted and enjoy securely in the state, the less may we attack its ultimate inward principle—in the case of the democracies, majority rule and the outlawry of violence.

One final point requires comment. One of the remaining objections of *laissez-faire* economists—who retreat from defense to defense—is that if civil servants have political rights they will associate and exact from the government, the budget, and the economy more than they are entitled to, and they will act as monopolistic producers and become slack and lazy. We will offer an answer to this question after consideration of the right of civil servants to associate and to strike.

#### THE RIGHT TO ASSOCIATE AND THE RIGHT TO STRIKE

THE modern claim to associate in industrial and professional unions is, broadly, the claim to exert pressure upon employers for various ends, mainly economic. Association takes place for other reasons also: for mutual aid against the common risks of life and for the combined organization of pleasure and study. Mingled with these reasons is another which, from a general social standpoint, is of far more importance: the defense and pursuit of economic interests. For through the employer, pressure is directly exerted upon that portion of the community which consumes the product of those associated, and this, in turn, affects the economic position of other circles. Associations within the civil service may at any moment find it necessary to exert pressure upon their employer, that is, the Treasury, and through that, the legislature and the public.

The position of civil service associations is peculiar in that the services of their members are rendered to a peculiarly wide public, in some cases to almost every inhabitant of the country. Their

services are as a rule monopolies: that is, there is no alternative source of supply. The services they render are of a particularly vital nature to society, indeed, that is why they have become socialized. Finally, the employer is the state, an institution of which undisputed authority is the essence, because that authority is so necessary and at the same time so liable to daily dispute. The state is a condition of subjection for us all, no matter what rights we obtain from this subjection and so many are ready to throw off this subjection when the opportunity offers that the state is forced to be especially stern. It is such a master that the civil service possesses. There are other, secondary, peculiarities, and these clearly emerge from the discussion of the right to associate among civil servants, and they determine, as we shall now see, the extent to which associations and the right to strike are permitted.

Associations and strikes have no inherent virtues and vices; these are no more than consequences of their purpose and actual use. Associations in the civil service have originated, like trade unions, to reform abuses and procure the amelioration of working conditions. They were a product of the nineteenth century, but of the late nineteenth century. They become most numerous and insistent in certain social conditions: the worse the conditions of employment in the civil service, the greater the number of associations and their bitterness of temper; the more developed certain theories of the state, the more factional and disruptive the associations.

*France.* France entered the last quarter of the nineteenth century with an administrative system full of mortal abuses. Uncertainty of tenure and rank, political favoritism in recruitment and promotion, classification which raised inequality of working conditions and salaries to the level of an organized system, spying and counterspying on the private, political, and religious activities of the civil servants, no guarantees that disciplinary measures would be justly conducted, contempt from Parliament and the public—

these were the main features of French administration. The Law of Associations of March 21, 1884, was the culminating point of a long struggle of workers and professions of all kinds to secure the right of association. This law gave workers exercising the same professions or allied vocations the right to unite without authorization in associations for the study and defense of their economic, industrial, commercial, and agricultural interests.<sup>95</sup> These associations could federate among themselves. The result of this law was the speedy formation of a host of syndicates, the originators of the modern French trade-union movement, centering in the *Confédération Générale du Travail*. No one during the course of the debates on the law of 1884 had dreamt of including the officials, but, at first slowly, and then with a rush, officials perceived the advantages of organization and began to establish associations. The administration stopped them. In 1887 the Minister of Education himself intervened with a letter addressed to the prefect forbidding such associations as "manifestly incompatible with the very notion of a public function."<sup>96</sup> Road sweepers, navvies, and similar workers in municipal employ made attempts of a like nature, were forbidden to proceed by the prefect and the Ministry of Public Works, but maintained a furtive existence. Other state employees in the tobacco and match factories were more successful—they were not counted among civil servants: in this way, the state railway employees were admitted to have a right to associate. These concessions were made upon the theory that such employees in similar public utilities, privately owned and managed, had the right to strike.

The government could not permanently repress the movements, and therefore the Radical ministry of 1894 decided

to still the tempest by allowing the associations to come into being under their good-natured sponsorship. Many associations came into being, the principal ones being those instituted by the postal, telegraph and telephone services. The teachers got their way. The mailed fist gave place to the approving smile: all in the vain hope that the associations would not defend themselves when attacked, and that they would be the friends of republican and anticlerical governments. For France was tempest-tossed domestically and internationally, and peace and unity at any price was desired, in order that monarchism, ultramontanism, and the foreign enemy might at need be vanquished. But official approval had not counted that the right of association might be construed, as for ordinary industry, into the right to the defense of professional interests. The manipulative employees, postal officials, warders, those in the public works departments and municipalities, and teachers, wanted more than the mere right of peaceful coalition. They wished full rights under the law of 1884. This was never accorded them by their masters, nor could they obtain it, legally, under the statute of 1884, for this was *limitative*: it limited the right to syndicate (i.e., to be an association with rights of aggression) to "economic, industrial, commercial and agricultural" interests. Yet outside it there was not even a legal right to form associations. In 1901 a new law on associations gave the government an opportunity to meet the demands of civil servants for associations without specifically according the right to strike as possessed by ordinary associations of private employees. All citizens could now form associations, with certain specific exceptions, but in these exceptions civil servants were not included. The result was an enormous expansion in the number of associations.

The ardent spirits among them were dissatisfied with this position. But to the ardor of the workers' leaders must be added the effect of syndicalist theory which for the French public services has been worked out by writers like Maxime

<sup>95</sup> Cf. P. Pic, *Traité de Législation Industrielle* (Paris, edition 1937), p. 216 ff.; and A. Lefas, *L'État et les Fonctionnaires* (Paris, 1913), p. 140.

<sup>96</sup> Pierre Harmignie, *L'État et ses Agents* (Brussels, 1911), p. 13.

## PROBLEMS WHICH ARISE AFTER RECRUITMENT

Leroy<sup>97</sup> and Paul-Boncour.<sup>98</sup> These desired the break-up of the present centralized state, and the division of political and administrative power among vocational associations, of which the public services are only special aspects. The central coordinating body composed of delegates of the associations would issue general rules, and within their wide confine, the public services syndicates would arrange for their execution. There would be an end of the interference of Parliament in petty matters, and the syndicates would be able to regulate all their vocational interests, technical and economic, in a rational manner hitherto unknown in the politically demoralized condition of the French civil service.<sup>99</sup>

We need not proceed further with analysis of the syndicalist theory. But the resistance to the power of civil service associations contained arguments of great import in the modern state.

The first impulse of resistance is simply authoritarian. There is an instinctive feeling that the state will crumble, or, at least, will be severely shaken by the existence of associations. For however peaceful the intentions of the associations, any body which unites members with a definite and special interest becomes suspect. Adam Smith observed this when he said that whenever he saw two bakers speaking together he suspected a conspiracy against the public. And the history of associations, corporations and guilds, especially in France, has been one to deepen this suspicion.

The Minister of Commerce said in 1891:

If they could carry out for their own profit the law of professional unions, it would be against the nation itself, against the general interests of the country, against the national

sovereignty, that they would organize the struggle.

M. Barthou, in 1906, had the same suspicion (by this time with ampler justification):<sup>100</sup>

When the State manufactures tobacco and matches, it does not see any reason for refusing to its workers, any more than to private employees, the right to form trade unions. But when it exercises, in a general interest, the functions and the rights of the public authority, can it authorize civil servants to turn against it, equal to equal, in an imperative and menacing manner, the very authority with which it is invested? Now notice that after the postmen and the teachers, the customs officers and the tax officials, have demanded the right to form trade unions. There is only one word to characterize such a state of affairs: anarchy. . . . The public service associations are violating the law; they are going counter to good sense, they are defying public order.

That is the context in which many people see this problem: it is defiance to the state, a threat to public order, a menace to sovereignty, indeed, mutiny. Defense to the state!—"Civil servants who share in public authority form a part of one corporation only, that which is the state—the nation itself!"<sup>101</sup> "To form a Trade Union . . . would be one part of civil servants open warfare against the nation!"<sup>102</sup> The gist of these arguments is pure fear of anarchy, and parliamentary conceit: deadening to liberty and provocative of violence, open or subterranean, and irrational repression.

A reasoned opinion regarding the exceptional position of the public servant is the second line of defense against the right to associate. This was best expressed by one of the earliest essays in resistance. M. Spuller, Minister of Education, quashed the attempt of the teachers in 1887 to form a trade union. His circular ran: <sup>103</sup>

A public situation is not a profession, in the same way as official pay (*traitement*) is not a

salary. The salary of the workman is higgled over penny by penny by him and the employer. . . Both of them ask but one thing of the state: liberty of struggle and competition. . . But official pay is, on the contrary, fixed by law and is not alterable except by the law. If we suppose that the pay seems small, is there any one of us who will pretend that officials have the right to form an association and if necessary go on strike to force the state to increase the scale? . . .

Is it not evident that once he has become a member of the national administration, the teacher cannot turn by turn present himself as an official, and in this quality receive fixed pay, demand guarantees of security, or to put it more clearly, irremovability, excepting for disciplinary penalty, and have the right to a pension; and then, all of a sudden, changing his character, put himself forward as a free worker, and demand, through the right of association, the means of defending his interests against the state, as a workman defends his at his own risk and peril against his employer?

Many a minister later made use of these same arguments: The civil servant has a secured status which imposes obligations upon other citizens. If he accepts that status he must, in return, relinquish the right to secure better terms by a show of force. We are obliged to guess at the fundamental ideas of state employment involved in this type of argument, for they are never stated. Probably people who argue in this way really mean that the state, through the legislature, has carefully considered in what exact measure the services it renders are socially important; and it has translated this estimate into terms of an amount of money in the budget. This expenditure was carefully related to the income of the country, its revenues, and the general currents of social and political thought. The state cannot do more than this, and, offering the salaries and other expenses of administration in the measure which it does, it is only able to continue to afford them if it obtains the calculated amount of service in a loyal, willing and uninterrupted fashion. If these conditions are not observed, if slack service, skulking, and interruptions occur, the national ability to pay is dissipated, and all state arrange-

ments fall to the ground. It is a matter of state efficiency, directly inherent in the nonprofit basis of state services, and not only a matter of the dignity of the state. This seems to us the only rational foundation of this type of argument; for merely to say that once the terms are accepted one should not kick against the pricks is puerile; one must show good cause why the pricks exist. It is not enough to say, as M. Briand once said, that the state has not the same elasticity in its financial arrangements as a private firm.<sup>104</sup> Whether that really means anything is a doubtful point; and if it did mean what it appears to mean, and if that meaning were true (that the state cannot demand and obtain more revenue promptly), it would still have to be explained why this is so. And when M. Clemenceau sonorously recounts the advantages of state employment—peacefulness and certainty<sup>105</sup>—he is still obliged to say why not more of these can be given at the demand of the officials; but he does not.

Indeed, these arguments are but the unimportant outposts of the central and vital argument against the right of association. The right of association (with or without the right to strike) always offers a threat to the continuity of the services, unless the right is much limited. For once the right is granted, even with limitations, even upon sufferance, a psychological condition is established—one of group conceit, a consciousness of identity and power, separatist in feeling—liable to resist the aims of the state by the cessation of work. Now, in private employment (comparatively) such a feeling and such a liability do not matter very much: only a master is inconvenienced or ruined by such behavior; and as for the consumers, they have (or had before the rise of giant monopolies) alternative

<sup>104</sup> Chamber of Deputies, *Débats*, May 13, 1907, p. 975. Briand's views regarding the strike underwent a mighty transformation between the time when he was seeking a seat in Parliament, and the time, say, when he became a minister.

<sup>105</sup> Cf. Harmignie, *op. cit.*, p. 149 (April, 1907: letter to the teachers).

## PROBLEMS WHICH ARISE AFTER RECRUITMENT

sources of supply. But the services of the state are, *ex hypothesi*, vital in their nature, and as a rule monopolies—there is no alternative source of supply. They have been deliberately and especially selected from among many things made and services rendered spontaneously by developing society as being of a fundamental nature, which neither prudence nor compassion could leave to the free play of supply and demand. They have become essentials of modern existence: they are indispensable. Therefore those who undertake them may not jeopardize their existence by the strike or threat of a strike. People cannot even bear to think that they might cease: for if such a thought became widespread, uncertainty would have entered, and certainty is the essence of social efficiency.

The theory which we have just expounded has never been fully analyzed in France, though Hauriou,<sup>107</sup> Duguit,<sup>108</sup> quite They do not

pursue their analysis to its base, namely, that social life would be badly injured. The politicians have only realized its fundamental meaning when there has been a strike, as in the arsenals, the posts, and the railways. In those cases it seems to me that they have rather been incensed that something called National Sovereignty, or the Public, has been defied, than understood the exact meaning of the strike.<sup>110</sup>

The proper line of resistance to strikes in the public service was taken in a bill to regulate the right to strike, placed before the Senate in 1895. The minister who introduced the bill said:<sup>111</sup>

It is necessary to distinguish among the different enterprises those which constitute public services properly so-called, affecting the general order and even the security of the country, from those which involve nothing other than a question of finance. . . . It is only there that the very principle of nationhood is at stake, that the right of demanding exceptional protection for it appears to be incontestable.

They were services of such importance that they had been exempted, in the law on the army (1889), from immediate mobilization: for example, firemen, road workers, dockers, surgeons, chemists of the *hospices*; workers in the penitentiaries, forest officials, customs, posts, and telegraphs, and the technical administrative sections of the railway services; inland revenue officials, the administrative officials in the state tobacco factories, and the Bank of France.

This and other bills of a like nature never passed beyond their preliminary stages.

Instead, France was delivered over to parliamentary tergiversation of a most dishonorable and despicable kind, and

tions which might stop or go counter to the regular normal and continuous functioning of the public service."

<sup>110</sup> Also they were struck with fear, or said they were, regarding national defense. A strike left open the frontiers! This was a powerful argument on the Continent before 1914! After World War II it has certainly not lost cogency.

<sup>111</sup> Trarieux, *Sénat, Débats*, March 4, 1895, and Documents, 1895, No. 38. Cf. Lefas, *op. cit.*, pp. 180-82.

<sup>106</sup> The possibility of alternatives, of course, becomes less and less true as the process of amalgamation proceeds; and we have shown that as amalgamation occurs in vital commodities, the state forbids strikes and lockouts.

<sup>107</sup> Cf. M. Hauriou, Note in *Conseil d'Etat*, August 7, 1909, in Sirey, *Recueil*, Part III, p. 145 ff., re dismissal of officials on strike, without previous communication of *dossier* (Law, April, 1905). "In effect, by the acceptance of the employment conferred upon him, the official submits to all the obligations deriving from the very necessities of the public services, and renounces altogether and for always faculties incompatible with a *continuity* essential to the national life. . . . [These] fundamental conditions of the existence of a state demand, on the one side, that the public services indispensable to national life shall not be interrupted, and, on the other side, that officials shall live in peace with the government. Let us observe that we appeal not to the *raison d'état*, which is a dangerous notion, because the well-being of the state may often appear to be connected with momentary circumstances, but to the theory of the unconstitutionality of the laws, which cannot be invoked except in regard to the permanent condition of state life, which doctrine and jurisprudence shall have already determined, and which, in consequence, would not permit of surprises."

<sup>108</sup> *Traité*, Vol. III, Chap. IV.

<sup>109</sup> Jèze, *op. cit.*, Vol. II, p. 246: "The idea of the public service has other necessary consequences: public servants are forbidden all ac-

the futile logic-chopping of constitutional lawyers, who commenced with abstractions and ended with abstractions. Parliamentary futility ended in postal strikes in 1906 and twice in 1909. The first strike of 1909 lasted a little over a week, and what imagination could not teach, the facts did. Paris was isolated from the rest of France and the world; the Minister of Foreign Affairs could get no news about the Balkan crisis, several most urgent telegrams being delayed; business began to languish, as prompt and exact information was impossible to obtain; the food supply of Paris was momentarily endangered; the stock exchange was so badly stricken that the effects were felt in London, Brussels, and Berlin. Then, later in the year, a more nationalized cessation of work took place and lasted ten days; similar effects were felt, and to them was added the sabotage of material.

The results were vindictiveness against the officials' leaders, some reforms, the strengthening of governmental feeling against the associations, and the introduction of a number of bills before Parliament to establish *Le Statut des Fonctionnaires*, that is, a code of working conditions for officials, in place of the numerous unintegrated regulations adopted piecemeal and many of them liable to violation by the minister. These principles were maintained by French governments to World War II: no right to strike; a right of association and of federation among associations; the right of the associations to challenge all administrative decisions interesting them before the *Conseil d'État*; but no federation with other than civil servants' associations.

French legal theorists have differentiated between *agents* or *fonctionnaires de gestion* and *agents* or *fonctionnaires d'autorité*. In the former class are all officials who are merely executive, without discretion, involving public authority, that is, not essentially part of the state, and perfectly assimilable to ordinary private employees; while the latter class consists of those who are more intimately connected with the governing power. It does not matter so much whether the

former class are subjected to the state, the lawyers argue, but certainly the officials "of authority" must be.

This distinction has given rise to a long discussion, every lawyer having a different system, pedantically created out of words challenged by every one else, and satisfactory to himself, but rejected with contempt by his "dear" colleagues. The process of argument has been as follows: Is this distinction between *agents de gestion* and *autorité* tenable? The lawyers answer, Yes! <sup>112</sup> Since this distinction is valid it can be at once translated into terms of the law of contract: the *agents de gestion* come within the category of private contracts, the others, in the category of public law. In the first case the State is simply an *employer*, in the second it is the *Sovereign-Power*. Syndicalists like Leroy <sup>113</sup> are especially devoted to this dichotomy, because all the employees falling in the first category are thus placed on a complete par as to their liberties with ordinary private workers.

Arrived at this point, the lawyers feel entitled to get over their difficulties by making havoc of the law of contract. (1) Does not the state contract just like a private company with the *agents de gestion*? Yes; for the state has often been compelled to pay damages like any ordinary citizen for a civil wrong. The *Conseil d'État* has admitted that in its judgments. (2) The object of the relationship between the state and the employee—is this not one that can be made by simple contract? To carry letters, count cards, add up figures, and sweep trains, are these not everyday objects of private contract? Yes; then why make a difference between the state and a private company? (3) What end is pursued by the contracting parties? Is not the state pursuing a simple end in treating with an individual; and is not the individual intent upon pursuing only his own interests and nothing more? This is so. Then the contract is identical with ordinary private contracts.

<sup>112</sup> Thus Hauriou, Duguit, Berthélemy. But Jèze says that the distinction has broken down (cf. *op. cit.*, Vol. II, p. 238).

<sup>113</sup> Cf. *op. cit.*, pp. 130-32.

It is extraordinary how this legal nonsense has blinded the eyes of otherwise clever people to the real facts of the situation. They discuss at length the nature of the contract made, the present condition of the contract, but this is not the problem. The problem is, what compels the state to demand submission of civil servants and to offer the conditions it does? It is in what lies behind the law, not in what is expressible in its inelastic formulas, that the political scientist is interested. All states prohibit strikes for all civil servants. Why? Not because they have not learned the law of contract in the university schools, but because of certain overpowering necessities. It is precisely these necessities which we desire to discover. Even the enlightened Duguít, by equating the state with a "public service corporation" (which was overstepping the mark), and by his attacks upon the theory of the moral personality of the state (an important service to law and political science), lent his authority to the school which divides the civil service into two classes. He says the *agents de gestion* are properly to be put on a par with private employees, although he himself cannot and does not make this distinction, but puts all public servants on a similar footing, demanding the right to associate for all of them.<sup>114</sup> For the erroneous notion that the state is a "public service corporation" and nothing more, by missing out the social conscience which the state imposes upon individual consciences when it undertakes a service, strips the state of its essential character. The conclusion is then easy, but full of error. And the attack on the moral personality of the state can go too far, for in destroying the notion of personality it may deny that its purpose is moral.<sup>115</sup>

The truth is that all public servants are employed in work which is of a specially important character in society. The reason which compels the public and the legislature to draw these services out of the

hands of private industry is like the force which is applied at one end of a rod or a length of string: the science of mechanics proves that this force is present not merely at the end or at any separate spot in the length, but pertains all through the length and gives every particle in the length a character equally peculiar. Thus, in the public services, the essential quality of being public, the why and wherefore of their socialized nature, pervades the whole. Some part of the civil servant's activity, whether he is in the immediate confidence of the minister and gives orders to thousands of subordinates, or whether he is a post-office messenger boy, the temporary master of nothing more than a second-hand bicycle which is not his property,—some part of the civil servant's activity is state-determined, it lives and operates in virtue of that peculiar fellowship and conscience called the state, it derives its character from the state, and would be otherwise were it not of the state. To ignore this is to be unaware of the nature of the state or to have petrified the state in a legal formula which has no counterpart in life. Harmignie, who has collected and analyzed the French theories of *agents de gestion* and *agents d'autorité*, says quite rightly that if you take any particular act it is fairly easy to decide whether it is one or the other—an *acte de gestion* or *d'autorité*, but it is almost impossible to distinguish the *officials* into these classes, "because the same individual accomplishes now one, now the other kind of action."<sup>116</sup> Harmignie includes teachers, postal officials, and the clerical staff of the ministries in *agents d'autorité*: the first, because "they are the champions of the republic public authority, by their work of education itself, because this education should be civic"; the second, because one must think of "all that is confided to the postal service; for the probity, the devotion, the faithfulness which the service demands and the police-interest, on which the confidence of the public should be neither betrayed nor shaken"; and the third, because one must

<sup>114</sup> Cf. his *Revue du Droit Public* (Paris, 1907), p. 410 ff.

<sup>115</sup> *Moral*—not whether it is a good or bad morality.

<sup>116</sup> *Op. cit.*, pp. 181-82.

remember "the occult but real administration exercised by them."<sup>117</sup>

We shall, in the conclusions which follow this discussion, analyze more clearly than has yet been convenient what it is in the public service which differentiates it from private or "free" services (though, in fact, *no* industry is free in the modern state), and what therefore distinguishes the civil servant from the private servant.

The constitution of the Fourth Republic introduced the right to strike. In its preamble the right to strike is generally guaranteed, but it is also stipulated that the right will be exercisable within the laws yet to be made to regulate it. So far as the civil service is concerned, the *Statut des Fonctionnaires* (article 6) does not take away a right to strike from them, but recognizes syndical rights to civil servants in their completeness. The organizations must deposit their constitution and list of directors with the head of the government department.

It must be remembered that this may well conflict with the rules of obedience to official superiors as stated in the very same law.

*Germany.* The Weimar *Reich* and state constitutions contained clauses giving freedom of association to all citizens (before that, the law was in a very anomalous state regarding trade unions), including the right of civil servants to associate. The *Reich* constitution contained two clauses relating to this question. Article 130 said: "All officials are guaranteed the freedom of their political opinion and freedom of association (*Vereinigungsfreiheit*)." Article 150 said: "Freedom of association for the protection and promotion of working and economic conditions is guaranteed to every one of all professions." The clauses do not contain any mention of the word "strike." This issue was indeed avoided deliberately by those who drew up these clauses, and for both civil servants and private workers, social control over the right to strike was left to particular laws and regulations. The consolidation of the Republic and

the rebuilding of social order resulted in the denial of this right. We shall now retrace our steps, and return to the condition of affairs before the Revolution, describe the theories then adumbrated and on the whole generally accepted, and then analyze the effects of the revolutionary and post-revolutionary events, which led ultimately to the denial of the right to strike.

Before World War I, Germany was blithely unconscious of the problem of the right of association; at least there was no ground for anxiety. The social situation of the civil service at that time, and the legal condition reflecting it, is well summed up by a famous jurist.<sup>118</sup>

The obligation of public service differs from other relationships of obligation by the *oath of service* which must be taken by the servant and which is combined with the commencement of activities. This oath is variously formulated but contains substantially the same promise faithfully to carry out the duty with which the taker of the oath is obligated. The purpose of the oath is to strengthen the ethical element contained in the public obligation to serve, by invoking the conscience and the awe of God, since the ethical element is not completely tangible in law. The civil servant is, however, legally bound to take this oath. Thus we are again concerned with a legal characteristic of official obligation which arises out of that ethical element. And it is indifferent what kind of subject the official obligation may be. Military leaders can be provided with a specially hired following by a private law contract; they can be helped by a peasant whose horses have been commandeered for the public transport; they can also be provided with a military waggoner: the last alone fulfils a sworn duty which under circumstances demands from him for the same function quite a different willingness to sacrifice himself than is expected from the former two types; this measure he must himself discover from his loyalty to the service; and just for that reason he is sworn in.

This type of theory was general.<sup>119</sup> It postulated an all-powerful state, the immaculate nature of its authority, and,

<sup>117</sup> Cf. M. Hauriou, note in Sirey, *op. cit.*, 1907, Part III, p. 49; Cf. also his *Droit Administratif*, 3rd edition, p. 685, note.

<sup>118</sup> Otto Mayer, *Deutsches Verwaltungsrecht*, 2nd edition (Munich, 1917), Vol. II, p. 245.

<sup>119</sup> E.g., P. Laband, *Staatsrecht*, 5th edition (Berlin, 1913), Vol. I, pp. 4, 100, and 433.

therefore, the subjection of the people—in this particular respect the subjection of the civil servant who has a special ethical relationship with the state, servant of all. There was no question of the right to strike, and this in itself was not discussed. All that was discussed, and this with question-begging business, was the subjection of the official to a code of discipline given to the law of the state and the theory of its authority under an absolutist monarchical system. When the revolution came, the previous repression had engendered a tremendous amount of force against the old system, and the impetus of that force at first swept away more than mature consideration could, or afterwards did, justify.

Complete rights of association were promised to all, and these were held to include the right to strike.<sup>120</sup> A number of exceedingly well-organized associations arose, at present including practically every person in the *Reich*, state, and local government services. But little by little the *unlimited* nature of the right of association was suppressed. The opposition was based upon grounds with which we have by now become very familiar:

Taking into account the pension rights accorded to them, and the general interests of the whole economic system, which must be protected, the final conclusion of the right of association, the right to strike, cannot be accorded to officials as it can to private workers.

But the phrase *the general interests of the whole economic system which needs protection* is a more enlightened line of objection than was usual in France. Another point of view, the rational attitude of which is to be applauded, was:

The official must first exhaust all possible means of conciliation (*alle Instanzen*) and must then finally have applied to the legislature, which provides the means, before he makes use of this right. Both morality and reasons demand this.

<sup>120</sup> Cf. L. Bendix, *Das Streikrecht der Beamten* (Berlin, 1922), pp. 5-11 (an intelligent book); proclamation of the Council of People's Commissioners, November 12, 1918; proclamation of Prussian government, November 13, 1918.

In the constitutional assembly of the *Reich*, the debates<sup>121</sup> at once centered round the meaning of the word "association." The constitutional committee of the assembly, dealing with what afterwards became article 159, found itself called upon to choose either the original form of the clause written by Hugo Preusz, in which the word *Koalitionsfreiheit* was used, or some other word which would not give the impression that the right to strike was admitted. The reporter of the clause asked the committee to take it that the original form did not touch the question of the right to strike. Whereupon an official of the Prussian Ministry of Commerce said: <sup>122</sup>

According to the meaning which has been previously ascribed, to the word *Koalitionsfreiheit*, it is supposed to include the right to strike. Now it is suggested that the right of coalition ought not in any way to be limited. . . . That is to say, at no time, in no condition of necessity, for no class of civil society, ought it to be limited: not for railwaymen, not for those who produce the most essential articles of consumption, not for people who control gas, fire, water . . . not for agricultural workers. I don't know whether the committee was really conscious of the full import of such a constitutional rule, and whether it really wishes to accept the responsibility for such a condition.

The word *Vereinigungsfreiheit* was chosen instead of the other: and an important member of the constitutional committee (Dr. Hugo Sinzheimer, a great authority on labor law) said, "we expressly declare that we do not wish to decide the question of the right to strike in the Constitution."<sup>123</sup> The only new ideas in full debate were the need for a right to strike as a counterweight to the organization of other industrial and professional groups in the state; and the difficulty of reconciling such a right with ministerial responsibility for the Budget.<sup>124</sup>

The issue, indeed, was positively settled, at this time at least by events, and

<sup>121</sup> Cf. *Bericht und Protokoll des 8. Ausschusses*, No. 391, p. 389 ff.

<sup>122</sup> *Ibid.*, p. 390.

<sup>123</sup> *Idem*.

<sup>124</sup> Heilfron, *op. cit.*, Vol. 7, p. 459 ff.

## THE RIGHT TO ASSOCIATE AND THE RIGHT TO STRIKE

by the declarations of theory evoked by those events. A threatened railway strike in Prussia in the spring of 1919 drew from the government the following decree:<sup>125</sup>

The right of coalition does not justify a breach of contract. Every refusal of work without consent is therefore a breach of duty which involves legal consequences.

In 1920 the Prussian government made quite unequivocal declarations that the right to strike did not exist.<sup>126</sup>

The so-called right to strike has no inseparable connection with the conception of the right of coalition. The strike is only one of the means, and not the sole one, through which one can attempt to attain better economic conditions. Whether *this* means shall be used is to be decided by the mutually obliging rights and duties which were included in the condition of officialdom. If the concerted stoppage of work is not compatible therewith, then the so-called right to strike is not given with the right of coalition. In its application to civil service conditions, these principles lead to the conclusion that the civil servant must not strike. The civil service status is a status of loyalty. *As the state could not conduct an ordered life and could in no wise express its will, it must enter into a relationship with the civil servant which obliges the latter to a complete devotion to the state.* This condition of loyalty also appears from the fact that the official takes an oath of service. The special character of the official's status is expressed in important condition of civil service law. With due regard to the duties towards the community imposed upon him, the right is denied to the official capriciously to leave his work. For this reason also the majority are appointed for life and made dismissible only by means of statutorily regulated disciplinary procedure. Further, the rights of officials to specified salary, half-pay and pensions for dependents, are legally regulated and are specially guaranteed by the *Reich* constitution. In this specially formed relationship of rights and duties, the civil servant who strikes, at once breaks his oath and violates the official obligation he undertook. The strike is an unpardonable truancy from work and its consequence is that the servant, during the time of the strike, loses his pay and must expect formal disciplinary procedure against him

with the purpose of dismissal. By this none of the great interests of the civil servants is violated, because at their disposal are other means of making their views valid than the strike. Since the representative assemblies of the states have a far-reaching right of controlling their executives, as the representative councils have on local government, the official has a specially influential instrument to get his demands satisfied by their help. The opinion of the Prussian government in this matter is identical with that of the *Reich* government, etc.

This clear and well-founded statement became the basis and model of all future development. The disciplinary courts have maintained a similar attitude. The duties of the officials, which we discussed in a previous section, as stated in the *Reichs-beamtengesetz* of 1873, the various state civil service laws, and departmental regulations, limited the constitutional right to strike.<sup>127</sup>

*Survey, and Comparison with Great Britain and the United States.* The grounds for refusal of the right to strike, when we sum them up, were, broadly, three:

(1) If the state engages itself to give certain benefits to its civil servants, and by its institutions and traditions substantiates its engagement, it may as a matter of a fair bargain require a corresponding guarantee that it will not be subjected to the inconvenience, at the minimum, of a strike.

(2) The interests which the state has in the continuous operation of its services are of an urgent, life-and-death nature, and these must not be stopped lest a great calamity befall it.

(3) If the demands of civil servants are given ample constitutional channels in which to find their vent, and, if just, their satisfaction, then the strike must be relinquished as a means of forcing the state to surrender.

In our opinion the problem is substantially solved in these three propositions.

<sup>127</sup> Brand, *op. cit.*, Sections 159 and 159A; also G. Anschütz (Berlin, 1933). *Die Verfassung*, on article 159. Cf. also H. C. Nipperdey, editor, *Die Grundrechte* (Berlin, 1929-30), Vol. II, article 159.

## PROBLEMS WHICH ARISE AFTER RECRUITMENT

We have already, in treating of France, expanded upon the first proposition. The rest of society is burdened with the provision of the officials' total remuneration; it cannot produce this without the security and steady continuation of all fundamental services, and therefore if it accepts the continuity of the burden, it not only *ought* to have (as a matter of everyday ethics) a *quid pro quo* in the matter of continuity of service, but it *must* have this, or else the source of its ability to pay the remuneration is gone. The moral claim is grounded in the economy of nature.

The second proposition, that the services performed by the state are so fundamental that they can on no account be allowed to cease, is of basic importance. It is indeed the root and center of the whole case against the right to strike; and this it is which frightens people even against the right of association. This fear is simply preconsciousness of danger to society of any interruption of the eternal round of industry. An analysis of the industrial and commercial life of any modern state shows that this fear is only too well justified, in the measure in which we grant that bread is better than liberty. The life of modern society is highly organized. Few activities are undertaken for the direct satisfaction of those who do them—the vast majority of commodities and services are produced for others than the producer. A delicate counterpoise of freedom and subordination of the myriad elements alive in society has been created as the necessary basis of social production and consumption. Most of the satisfactions of life have at least a particle of economic welfare allied with them, sometimes as the end and purpose of the satisfaction, sometimes as instrumental to a largely spiritual satisfaction. And the mass and quality of things done, thought and consumed which make up modern civilization are vitally dependent upon its high material welfare. Without this there would be neither means, nor leisure to enjoy the means, and all the conditions of work and worship would assume another aspect. Whether that aspect would be more pleasing to any

particular individual among us or not it is immaterial to discuss here. It is enough if we can admit that it would be otherwise. But we have everyday proof that the mass of mankind do not want it otherwise, and the plans of social regeneration made by the great leaders of thought are rarely based upon a reduction of the amount of wealth, but most frequently postulate consciously or unconsciously an increase in the riches of the world. Its true nature is disguised in the modern god, "The High Standard of Living."

This indispensable standard of living cannot be produced otherwise than by two main institutions: subdivision of labor, and credit. The first produces a number of independent, specialized and well-nigh nonversatile economic groups; the finished product of each is the raw material of the other, and the sectional services must be combined to attain any utility to a consumer. All economies—that is, the minimization of effort with the maximization of gain—are derived from the regular, steady, punctual and exact cooperation of otherwise unrelated multitudes, information about the market, transport, command of raw materials and labor long before the product can be consumed, and all the machinery of exchange is needed to help this method of indirect production at the highest pitch of efficiency. Everything, down to eighths, even thirty-seconds of cents must be calculated, anticipated, and weighed when supply and demand are being adjusted to one another. And the months and the years in which deliveries and payments are due are assumed—by operations in which people place confidence—to be here already. Time, which is mathematically-calculated interruption, has been abolished by the economic need for continuity; continuity would be abolished by interruption, if it returned unexpectedly. Not one of the innumerable factors in the calculation may be changed by an undue stoppage in its predicted orbit upon which so many other revolutions depend. A strike in one industry of importance may do grievous harm to the life of other parts of the community, who, so far from being immediate

parties to the dispute, do not even know what it is about. The state is therefore compelled to demand the continuous fulfillment of social expectations. Who compels it? Society. We have reached a stage in the life of the state where even the dissidents and the well-nigh irreconcilables conduct their coercive (defensive or aggressive) campaign with order and regard for the basic necessities of life. The German railwaymen in 1926 were at pains to transport milk; the English coal miners would not let the mines get flooded; and in the General Strike of May, 1926, the British trade union organizations issued directions and made arrangements for the proper conduct of the nation's vital necessities. In the French General Strike of November, 1947, similar restraints were observed.<sup>128</sup>

Now, in proportion as the services are vital to social existence, obedience to the state must be unconditional. Of such a character are the public services. Communications, revenue, health, the ordering of trade and industry and their various processes, which secure conditions of justice and physical health for the weaker members of society, and prevent, at least in part, waste and tyranny, the care of the poor, the widow and the orphan—our prudence and compassion have declared these things to be so urgent and vital that we will not have any but the state to administer them. In proportion as we do not admit that these can be given up we are driven to demand their continuity, that is, to forbid any right to strike; or to place this right under such restrictions that it loses its original meaning and force.

What is public, what is private, service? Now it may be said that all this proves nothing in particular about the *public* services. Does not the analysis we have made lead us to the conclusion that *all* great services—whether in private or in public hands—should be forbidden to strike, or allowed to strike only under

very limiting conditions? Such a conjecture was made already by Harmignie in the course of his discussion of French civil service associations.<sup>129</sup>

It is objected that the interdiction of the right to strike ought then to be extended to workers of the railway companies and of all services the monopoly of which is a concession and which are of public utility, as lighting, for example. We agree; it is necessary assuredly to take special legislative measures concerning the workers of these enterprises and to forbid them, under severe penalties, to suspend their work.

In most countries some limitations had already been established before the World War I. Apart from countries where a sheer authoritarian attitude was taken up by the government, as in Rumania and Bulgaria, limitations were strict, even stricter than in great modern democracies like Australia and New Zealand. The state had in Australia and New Zealand come to mean so much to the ordinary man, to give him so many rights, that these could not be maintained without corresponding obligations, for the obligations were part of the energy which produced the resources out of which rights were distributed. Therefore those countries placed all industry under a régime which put off the right to strike until the time when human reason had accomplished all it could. Courts of Conciliation and Arbitration were established, principles of a "living wage" were adopted, and strikes and lock-outs, in private as well as the public services, were made illegal. It is quite clear that economic and other benefits are created by labor, capital, and organization: if these stop, the benefits cease; and the more carefully organized and planned the benefits are, the more indispensable is the continued work of its creators. The whole tendency of trade-union legislation in Great Britain since 1906 has been toward the limitation of the power to strike.

Naturally the state has first taken steps where it could most easily take them, namely, in relation to the officials in its own immediate service, but the doctrine

<sup>128</sup> Cf. The General Strike Order, Trade Union Congress Memorandum, given as Document No. 72 in Page Arnot's *The General Strike* (London, 1926), p. 160 ff.

<sup>129</sup> *Op. cit.*, p. 329.

## PROBLEMS WHICH ARISE AFTER RECRUITMENT

which it has propounded is valid to many so-called "private" industries too. In Great Britain the subject attained little prominence until after the General Strike of 1926. Up to that time there had been an extensive growth of civil service associations which had met with no obstacle from the government. Very little, if any, discussion had taken place about the right to strike. No law forbade any civil service association to come into being, or, if it was established, to affiliate with outside bodies.<sup>130</sup> For the predominant purpose of British statesmen has been liberty rather than security and order.

The grades of the service below the administrative have for long felt a certain sympathy with the Liberal and Labour movements. The theory of the Treasury in regard to pay and conditions in the civil service is that they ought not to be more than that given by any employer outside the service. Therefore it was and is to the interest of the associations within the service to cooperate with the trade unions outside to raise the general rate of wages and improve the conditions of labor. Further, the service associations recognize the fraternal duty of uniting with other labor forces to increase their strength and give them aid in overcoming the hurtful qualities of the present organization of industry and commerce and society. Therefore the associations grew<sup>131</sup> and they affiliated to the Labour party and the Trade Union Congress. Not sympathetic to such affiliation, and self-excluded from it, were the top 20,000 of the administrative, upper clerical, technical and legal staffs. The division between these and the subordinate and manipulative grades is one between those who are in positions of command and those who take orders. Those who take orders are, in the mass,

allied with the Labour movement; the rest are, on the whole, satisfied with the state as it is, and are sufficiently well off not to feel the spur to join the party of criticism and reconstruction.

There was no prohibition of the right to strike: the rule then was and still is that the civil servant who does not obey this may be dismissed and even be denied his pension, without recourse in the courts!

Before 1926 affiliation had raised no great controversy,<sup>132</sup> though the affiliating associations were conscious of their peculiar situation—servants of the state yet allied with a party whose intention it is fundamentally to alter the nature of that state. The state, it was said in popular discussion, could not be sure of the uninterrupted service of those who belong to affiliated associations, since they are liable to be recommended to go on strike at any moment. The state had the right to expect members of the civil service to volunteer for any duties consequent upon the emergency. Civil servants enjoyed the special advantage of being a "sheltered" occupation, and the price of this was political neutrality. Against this view the attitude of the civil service associations was well stated in the ballot paper issued to members of the Civil Service Clerical Association, which, finding many dissentients in its ranks, took a referendum on the question. The association admitted affiliation, but denied that it was obliged to go on strike at the request of other labor organizations. As regards the position of civil servants as servants of the state, it argued there was no necessary inconsistency between civil servants doing their work faithfully and well, and yet at the same time being federated with other bodies of wage earners, through the Trade Union Congress, for the protection of their wage interest.

It was rejoined that if the demands of civil servants are given ample constitutional channels in which to find their vent, and satisfaction when found to be just,

<sup>130</sup> Cf. Bernard Léger, *Les Syndicats des Fonctionnaires en Angleterre* (Paris, 1929): cf. also H. G. Swift, *History of Postal Agitation* (London, 1900).

<sup>131</sup> For their present numbers and constitution, cf. statements submitted to the Royal Commission by the Civil Service Clerical Association, the Society of Civil Servants, the First Division, etc., and the Civil Service Clerical Association's Year Book.

<sup>132</sup> Macdonnell Commission, Fourth Report, pp. 99 and 100.

the strike must be relinquished as a means of forcing the state to surrender.

The issue was decided in a state of public temper rare in Great Britain. The trade unions were beaten until they were dazed, and Parliament, which had several times in the past few years been unable to find time to deal with a Trade Union Bill to limit the political and industrial powers of the unions, attacked the new and steaming dish with a really unwonted gusto.<sup>133</sup> The result was the Trade Union Act of 1927, clause 5 of which related to civil servants:<sup>134</sup>

. . . prohibiting established civil servants from being members, delegates, or representatives of any organization of which the primary object is to influence or affect the remuneration and conditions of employment of its members, unless the organization is an organization of which the membership is confined to persons employed by or under the Crown and is an organization . . . in all respects independent of and not affiliated to, any such organization as aforesaid the membership of which is not confined to persons employed by or under the Crown or any federation comprising such organizations, that its objects do not include political objects, and that it is not associated directly or indirectly with any political party or organization. . . .

In May, 1946, the act was repealed, and the unions returned enthusiastically to affiliation with the Congress.

The United States civil service does not permit the right to strike, or even to affiliate with organizations imposing or proposing strikes against the United States. Thus the act of August 24, 1912 (37 Stat. 555) provides that postal employees will not be subject to reduction in rank or compensation or removal from the service for belonging to any form of organization of postal employees, so long as the organization is not affiliated with

any outside organization imposing an obligation or duty upon them to engage in any strike, or proposing to assist them in any strike, against the United States. . .

Then in a note on Executive Order No. 7916 of June, 1938,<sup>135</sup> the Civil Service Commission, commenting on the requirement that grievance procedures should be set up in each department (according to the order), gave its approval to the recognition in all departments of the right to join unions, free of the fear of victimization for such membership or nonmembership, and then generalized the strike prohibition for all civil servants.

How, then, does it come about that there are big unions of federal civil servants affiliated with the A.F. of L. and the CIO? It is managed by the repudiation of the right to strike contained in the constitutions of the civil service unions themselves, and by the refusal of the associations to accept unions which have not made such a repudiation.<sup>136</sup>

The Taft-Hartley Labor-Management Relations Act of June, 1947 (Section 305) made it unlawful for any person employed by the United States or any agency thereof (including any wholly-owned government corporation) to participate in any strike. The penalty is immediate discharge, the forfeit of civil service status, and a three-year ineligibility for re-employment.

We have already discussed the effects of a strike upon economic and social life. It could yet be argued by civil service associations that since the strike was a very remote contingency, no government ought to establish a restraint. But, indeed, the question is not merely one to be determined by the probability of the event, but of the omnipresence of a threat. The right to strike is no positive guarantee: it is the residue of the individual claim—and even legal right—to freedom of opinion and person. The right to strike is a

<sup>133</sup> Cf. Mr. Churchill's answer to a deputation of the Civil Service Civil Rights Defence Committee, representing all the affiliated Unions (March 1, 1927), reproduced in *The Post* (organ of the Union of Post Office Workers) for April 9, 1927. It is still of great interest.

<sup>134</sup> Sect. 5, Sub-Sect. 1 only is reproduced. The whole of the clause should be studied. Cf. also Statutory Rules and Orders, 1927, No. 800.

<sup>135</sup> Cf. Civil Service Act and Rules, etc., etc., November 30, 1941, p. 144. Cf. L. D. White, "Strikes in the Public Service," *Public Personnel Review*, January, 1949.

## PROBLEMS WHICH ARISE AFTER RECRUITMENT

result of the state's noninterference with the right to freedom of person. But when the state does not interdict, the result is that when men act in association, they feel that they possess an ultimate coercive power, a positive weapon. The possession of this weapon acts psychologically upon its possessors: it increases their will, as well as their power, to resist. It offers an alternative to negotiation with the good will of the other party. This brusqueness may jeopardize the public welfare; and it is the fear of this that is expressed by the opponents of the right to strike. Its legal acknowledgment may deliver over events to passion before all the devices of reason are exhausted. Yet its nonexistence may also set up against the guardians of public order so little resistance that they will act ignorantly, passionately, on private or class motives, and slur over the justice of civil servants' claims upon the public.

Constraint put upon civil servants, therefore, cannot permanently operate unless the state admits constraints upon itself, or to speak less abstractly, unless the people and legislature establish machinery which will control and at need coerce ministers, Treasuries, and heads of government departments to the end that they may act justly. For as has been said, the strike is not a right, it is a fact,<sup>137</sup> and "the right to strike is not one to be asked for, it must be taken!"<sup>138</sup> The whole of citizenship may be summed up in the phrase, *organized mutual self-restraint*. If this does not exist, strikes will come, right or no right. So that the strike being excluded, what are its indispensable substitutes? They are (1) institutions, in which civil servants can obtain a full and proper hearing, and in which their legitimate grievances can find redress and (2) public recognition that the authority of the people, of the legislature and ministers, has moral bounds, in that it must be willing to temper the doctrines of Treasury control and economy—both potential fetishes—with justice to officials. The second is the fundamental necessity. As the

civil service is expected to subject itself to the community, so is the community obliged to subject itself to the civil service. Enlightened nations have already made arrangements to guarantee this, while others still persist in the true belief that, for a time at least, exploitation is possible, and the untrue belief that discontent suppressed is discontent dissipated.

*Collective Bargaining.* Is collective bargaining in the sense that it exists in private enterprise conceivable in public enterprise? The subject has been raised chiefly in the Tennessee Valley Authority, which wished to establish a very enlightened personal policy, and it is inferrable as a problem from the discussions regarding the nature of the contractual relationship of civil servant and state. As regards the latter, it has been generally denied that civil servants fully established are in contractual relationship, whereas people engaged for a specific job may be put on a contractual basis. Normally, all civil servants are engaged according to the status prescribed by a law or an order laid down by the executive. It is denied that this is contractual, because it is desired to imply that though the official may resign he cannot strike. Therefore he cannot bargain collectively because, like the strike, this would imply an equal status with the state and imply the ability to shed engagements when it suited the civil servants in the event of a dispute.

The Tennessee Valley Authority was at first inclined to say that it had introduced collective bargaining, and it certainly established and worked processes whereby the point of view of both sides was as openly expressed as in any bilateral negotiations in private industry. Yet in the introductory statement to its Employee Relationship Policy, the Authority has clearly declared that its first duty is to the public.<sup>139</sup>

What of the argument that unless there were strong resistance against the unions of civil servants, they would exploit the

<sup>137</sup> Lefas, *op. cit.*, p. 199.

<sup>138</sup> Harmignie, *op. cit.*, p. 118.

<sup>139</sup> Cf. Civil Service Assembly (Chicago, 1943), *Employee Relationship in Public Service*; also S. Spero, *Government as Employer* (New York, 1948).

state for their own benefit? This was rather more plausible two or three decades ago before the problem became concrete: it was possible to speculate pessimistically in the abstract, and laissez-faire economists did so. They believed that bodies of civil servants would get their pay raised, or get their hours or intensity of labor reduced, or fall into well-paid inefficiency. They would do this, it was suggested, by pressure on members of the legislature, by lobbying, by threats to strike, and (in some electoral districts) by voting for pliable candidates. Time has shown the ridiculousness of these not-disinterested guesses. It might then have been realized that the number of officials was too small to have any decisive threat to the legislature; that it was practically impossible for the civil service vote to be so spread among all the districts that the civil servants' votes would decide the balance. On the other hand, if the civil service became very large, then the civil servant as citizen had interests in common with the rest of the nation superior to the civil servant as employee of the state. He also would have an interest in stability, or general political change or conservatism.

*The Right to Strike under Socialism.* If, again, the civil service comes to embrace several great occupations like power, fuel, conservation, transport, credit, housing, public medicine, steel, chemicals, and various others, then the workers in these occupations are more likely to be—indeed, experience now shows us that they are—in competition with each other for the division of the total national income in wages and taxation burdens and benefits, rather than in collusion with one another to exploit somebody else. The great battles of our time on the economic field are really battles between the occupations rather than between the workers and the employers or between the workers in public enterprise and the state as employer. But this latter tension does exist, for the state as employer is also the state as representative of the whole body of consumers. It is through the instrument called the "state" that the respective claims for wages,

hours, and conditions are made by the occupations upon each other; the state is the instrument of negotiation and adjustment, and, in the end, of enforcement. All this has become very manifest with the rapid and massive development of nationalization and intensive regulation of industries in Britain and Europe.

As for the right to strike, that itself is kept by labor unions in rationalized industries: where it is not recognized, as in TVA, strikes have nevertheless occurred. In the last final tension they may very well occur. If the ultimate right to rebel did not exist—though not acknowledged—then legislatures and governments and the personnel departments might become stonyhearted and authoritarian to public employees. But it is noteworthy that the leaders of the labor unions in the industries which have been nationalized recognize the need for new self-restraints by the workers themselves on their right to strike. It is asserted that the trade unions in a socialized or socializing state have gone beyond the field of combat with the capitalists, and that, as citizens and voters, they are themselves henceforth owners of the means of production. Upon them, therefore, now falls a responsibility, to get the best out of the capital invested, and the organization also, and to satisfy the consumers by good quality and the maximum production.

The old employer-employee relationship will continue to exist in nationalised industry, but in a fundamentally altered form. The employing authority no longer represents a limited private interest engaged in the pursuit of profits. It represents a public interest. The welfare of the whole community is its concern. It will conduct the industry as a social service, owing obligations equally to the workers it employs, the consumers it serves, and the people as a whole. New wage relationships, it seems to me, and a new technique in collective bargaining, must be evolved to meet this altered situation, as regards nationalised industry at any rate. . .

. . . I believe that we shall have to re-examine many trade union practices where they tend towards restriction; we shall have to do some fresh thinking about the historic-

## PROBLEMS WHICH ARISE AFTER RECRUITMENT

ally conditioned principles of collective bargaining. . .

Reckless and irresponsible elements in our trade unions can work much mischief to-day. There have been unauthorized strikes and conflicts arising out of inter-union relations that are disquieting. . . Every responsible trade union official and every loyal member of the unions can see the dangers arising from unofficial strikes. . .<sup>140</sup>

<sup>140</sup> Speech by Charles Dukes, chairman, Trades Union Congress, Annual Report, 1946.

Thus, the new occupations and services in the public management, which yesterday were private enterprise, are hardly distinguishable in outlook from the civil service unions and the public as employer in the matter of responsibility for steady production. They were on the way to that assimilation even before they were nationalized, and they were nationalized because, in part, society now urgently required the assurance of their uninterrupted production.

## *Redress of Grievances and Guarantee of Rights in the Civil Service*

THE machinery whereby civil servants can make their complaints heard and secure a redress of their grievances is broadly fourfold: the national and local representative assemblies and the Treasury (or Ministry of Finance); special representative councils like the Whitley Councils in England or the Officials' Representative Councils in Weimar Germany; courts of arbitration after the model of the industrial and wage courts for private industry; and formal arrangements with procedure of a judicial nature for the prosecution of established rights and the challenge of disciplinary sentences.

### LEGISLATURES AND TREASURIES AS MEDIATORS

LEGISLATURES mediate between the civil service and the taxpayer. History shows that they are not liberal toward the civil service, but rather the reverse. It is to their interest in every country to act in such wise that they can triumphantly claim to be a champion of economy. No legislature has ever shown spontaneous generosity to civil servants. The atmosphere is one rather of meanness. Civil servants' salaries are easily accessible to economizing governments, and their professional ethics leave them defenseless against a barbarian public. In Great Britain there are many occasions when civil service conditions may be discussed before

the House of Commons, but only a critical situation (like the Gregory case) or some rank injustice tactlessly committed can cause the House to turn its attention away from the more general matters of administration which are discussed during supply debates. But Parliament has no special machinery to focus and force its deliberate and detached attention upon grievances which may seem minor to it but which are important in the eyes of civil servants. Parliamentary machinery failing, the mediator between civil service and taxpayer is the Treasury.

The Treasury has been blamed for its tightfistedness.<sup>1</sup> But its general arrangements, financial and otherwise, for the civil service, have been quite liberal compared with other countries. Day-by-day grievances demanding adjustment of pay and conditions—adjustments which are fairly promptly made in private industry—may be met by the Treasury in a spirit of authority, churlishness, and unreasonable negation. However, the developments of the years since 1919 have on the whole encouraged much more reasonableness and understanding. Since the Establishments Division,<sup>2</sup> the Organizations and Methods branch, and special estab-

<sup>1</sup> Cf. Report, Machinery of Government Committee, 1918, Cmd. 9230, pp. 17-21.

<sup>2</sup> Cf. 16th Report, Select Committee on National Expenditure, No. 120 of 1942, "Organization and Control of the Civil Service."

## REDRESS OF GRIEVANCES AND GUARANTEE OF RIGHTS

lishment officers and divisions in the department have been instituted in the Treasury, its understanding of staff questions has been much enriched.<sup>3</sup> It cannot be denied that the Treasury still needs an impetus from the outside, and the civil servants a powerful means of advocacy, to secure a proper sensitiveness to staff questions. They cannot dispense with their associations.

The situation in Great Britain is, however, better than in Third Republic France. There the Ministry of Finance was overshadowed by the parliamentary commissions of the budget (and their sub-committees), and neither the Chambers nor the commissions showed any tenderness of regard for the civil service. Problems of staffing, bonus, and pay were met with febleness, chicanery, illwill, ignorance, and self-seeking meanness and shuffling—everything, indeed, except wisdom and social spirit. Nor had civil servants the power to invoke the aid of Parliament by petitions exposing the policy of the executive in their regard. This privilege which the constitution of 1875 passed over in silence is a "natural right" for ordinary citizens and is available to British and American civil servants, but the French chambers never censured the government which suppressed it for officials. Though some civil servants sat in Parliament, the situation of the whole body was not thereby improved to any degree worth mention. The civil service was, indeed, compelled to conduct active practical campaigns, especially during elections, to secure attention to its demands. The great *Fédération des Syndicats de Fonctionnaires* (formerly adherent to the C.G.T.) had black lists of deputies who did not support civil servants' demands, and these names were communicated to the groups in the constituencies. The Federation in a resolution of its congress of 1924 said:<sup>4</sup>

It knows that it can count upon the absolute devotion of all its fighters to whom will fall the task of a giving to this organization the necessary vitality to cause to triumph at the elections not any particular party, but a current of opinion strong enough to combat the present influence of the great economic groups and to facilitate the evolution of syndicalism.

The Congress of the United States is not an open-minded court of appeal for civil servants. There is an exceptionally strong mistrust of the executive authority and an extraordinary (almost a vicious) spitefulness toward bureaucracy. It has been possible for civil servants to "get at" Congressmen and Congressional committees by backstairs organizations. But the virtue of this system from the standpoint of the civil service—accessibility—is offset by the great drawback of the sporadic, haphazard, unsettled, and partial nature of such solutions. There is no substantial or continuous guarantee in such machinery. The United States Treasury is not to be compared with the British Treasury either for the scope of its authority or for its energy and traditions in civil service matters. The division of authority over the civil service between Bureau of the Budget and Civil Service Commission is vastly different from that between the British Treasury and Civil Service Commission, for the former is authoritative and dynamic almost entirely, the latter only trivially instrumental. Hence initiative is confused and disintegrated in the American arrangement.<sup>5</sup>

The Act of August, 1912, provided that:<sup>6</sup>

the right of persons employed in the Civil Service of the United States, either individually or collectively, to petition Congress or any member thereof or to furnish information to either House of Congress or to any committee thereof, shall not be denied or interfered with.

<sup>3</sup> Cf. L. Mayers, *op. cit.*, p. 549.

<sup>4</sup> Cf. description of this in evidence of Russell Scott, Royal Commission on the Civil Service, 1929, *Minutes*, Vol. I, and Warren Fisher, *ibid.*, pp. 1278 ff.

<sup>5</sup> Cf. G. Carrère and J. Bourgin, *Manuel des Parties Politiques* (Paris, 1924), p. 253.

<sup>6</sup> 37 Stat. 583. Cf. Report of the President's Committee on Administrative Management, p. 7 ff., and the special study by F. Reeves and P. David, *ibid.*, pp. 59-139. Cf. also J. McDiarmid, "Changing Role of the U.S. Civil Service Commissions," *American Political Science Review*, December, 1946.

This gave rein to the attempts at organization, and from 1916 the National Federation of Federal Employees has been able to exercise due influence upon Congress. The statutes creating the Reclassification Commission and the retirement system (1920 and 1922 respectively) were due in large measure to the activity of this organization, the latter statute being especially the result of the clever application of the strength of the employees' organizations. That strength is reinforced to a tremendous degree by the electoral power of the American Federation of Labor and the CIO, to which various employee unions are affiliated. The employees have been forced into a lobbying attitude by the inertia, ignorance, and incompetence of Congress. Before the organizations came, the employees suffered and had no convenient means of redress. Yet Congressmen like Ramspeck (himself once a political appointee) have induced a more rational atmosphere. The establishment (in 1946) of standing committees of the Senate and the House on Civil Service is an important improvement of procedure. Yet it is an extraordinary fact that the salaries of the top British civil servants are considerably higher (in a less wealthy society) than their American colleagues! Why?

In Germany one of the defenses against the right to strike was the alleged existence of ample other means for the redress of grievances. And, indeed, there is much solidity in this defense. Apart from the fact that civil servants had direct representation in the *Reichstag* and in the state parliaments, and in recognized organizations, the parliaments themselves were organized to give the civil service easy and prompt access to them. In the *Reichstag* the Fourteenth Committee (Affairs Relating to Civil Servants) discussed and settled the main lines and the details of civil service questions and laws before they went before the full House. The permanence of the committee, its smallness, its special field, all offered to both the public and the officials a rational consideration of their respective claims, although higher administrative officials,

members of the *Reichstag* and academic observers, argued that the civil servants exercised, perhaps, undue power.

## REPRESENTATIVE COUNCILS

DURING the last generation the governing body in industry, private as well as public, has learned the value of creating councils in which representatives of the workers have a seat, and where the demands of both sides may be candidly presented and discussed.<sup>7</sup> The chief merit of this system is not that it necessarily gives the worker or civil servant any greater control over the conditions of his work than before, for that obviously depends upon the extent to which the employer is willing or compelled to waive the extreme use of his property rights, nor that it avoids conflict, but that it is possible for issues which rankle to secure a prompt outlet. Timely remedies may then be applied and injurious consequences reasoned over and appreciated before they come. He who hesitates is won.

*The Whitley Councils in England.* In Great Britain, until 1917, individuals and associations in the civil service, like the United States civil service till more recently, were obliged to act mainly by memorial which finally reached the head of the department and then the Treasury.<sup>8</sup> The chief disadvantage of this method was that negotiations were in writing, and personal discussion was almost entirely excluded. In 1917 a vast change was contemplated in private industry, and this had its effect upon the civil service. In private industry it became evident, especially during the war, that it was not only unsatisfactory conditions of remuneration that caused industrial unrest, but a desire to be consulted about these conditions, and to learn how far orders and policy were the arbitrary expression of the employer's personal

<sup>7</sup> Cf. literature on this subject published from time to time by the International Labour Office.

<sup>8</sup> Cf. Royal Commission on the Civil Service, 1929. Introductory Memoranda, pp. 70-71.

## REDRESS OF GRIEVANCES AND GUARANTEE OF RIGHTS

temper and how far a necessary condition of industry. In 1917 the Whitley Report on Relations between Employers and Employed was issued; it touched only the nonpublic industries.<sup>9</sup>

Civil servants pressed for the application of the Whitley proposals to the public service. By the end of July, 1911, a council of officials and representatives, after negotiations and the cabinet's approval, drew up a model constitution for the departmental Whitley councils. Generally, it was stated,<sup>10</sup>

The objects of the Council shall be to secure the greatest measure of cooperation between the administration, in its capacity as employer, and the general body of the staff in matters affecting the department, with a view to increased efficiency in the department combined with the well-being of those employed; to provide machinery for dealing with grievances, and generally to bring together the experience and different points of view of the administrative, clerical, and manipulative Civil Service.

There are many departmental councils on the model set out, with wide variations according to the peculiar circumstances of each department, and each has small numbers representing equally official and staff sides. The National Council, which considers the interests of the service as a whole, and to which the departmental councils are bound to refer general questions, is composed of fifty-four members divided equally between official and staff sides, whose representatives must be "persons of standing (who may or may not be civil servants)." It has consisted on the official side of the permanent secretaries of departments or other higher officials, and since 1922 of three members of Parliament. The Controller of the Establishment Branch of the Treasury is chairman. The staff side representatives must be appointed by civil service groups or associations<sup>11</sup> named in the constitution.

<sup>9</sup> Cmd. 8606 of 1917.

<sup>10</sup> Para. 21, constitution, National Council.

<sup>11</sup> On all constitutional questions cf. J. H. Macrae-Gibson, *The Whitley System in the Civil Service* (Fabian Society, London, 1922). See also L. D. White, *Whitley Councils in the British Civil Service* (Chicago, 1932), and E. N.

About one half the members of the staff side of the Council have been full-time officers of associations, the rest serving civil servants.

The Whitley Councils are concerned with the problems of nonindustrial staffs in posts carrying remuneration only up to £700 a year.<sup>12</sup> The industrial staffs have special industrial councils.<sup>13</sup>

The functions of the Whitley councils include (1) provision of the best means for utilizing the ideas and experience of the staff; (2) securing the staff a greater share of responsibility for the determination and observance of the conditions under which they work, and the determination of the general provisions governing recruitment, hours, tenure, and remuneration; (3) encouragement of further education of civil servants and their training in higher administration and organization; (4) the improvement of office machinery and organization, and the provision of opportunities for the full consideration of suggestions by the staff on this subject; and (5) proposed legislation so far as it has a bearing upon the position of civil servants in relation to their employment.

What is the authority of the councils? In 1919 negotiation between the perturbed staff representatives and official representatives resulted in a unanimous report which became, substantially, the constitution of the councils.<sup>14</sup> The constitution goes beyond making the councils merely advisory. It says that "the decisions of the Council shall be arrived at by agreement between the two sides, shall be signed by Chairman and Vice-Chairman,<sup>15</sup> shall be reported to the Cabinet and thereupon shall become operative." As for the Department Councils, their decisions "shall be reported to the Head

Gladden, *Civil Service Staff Relationships* (London, 1943).

<sup>12</sup> Including scales which commence below £700 but rise above it.

<sup>13</sup> Cf. Royal Commission on the Civil Service, 1929, *Introductory Memoranda*, p. 85. Cf. report on establishment and progress of joint industrial councils, 1917-22, published 1925.

<sup>14</sup> Cmd. 198 of 1919.

<sup>15</sup> A member of the staff side.

of Department and shall become operative." <sup>16</sup> Does this mean that the decisions made overrule the will of the cabinet and of individual ministers? At the tenth meeting of the National Council, a committee was appointed to clarify this question, and it agreed upon this definition:

'The establishment of Whitley Councils cannot relieve the Government of any part of its responsibility to Parliament, and Ministers and Heads of Departments acting under the general or specific authority of Ministers, must take such action as may be required in any case in the public interest. This condition is inherent in the constitutional doctrines of Parliamentary Government and ministerial responsibility, and Ministers can neither waive nor escape it.

It follows from this constitutional principle that, while the acceptance by the Government of the Whitley system as regards the Civil Service implies an intention to make the fullest possible use of Whitley procedure, the Government has not surrendered, and cannot surrender its liberty of action in the exercise of its authority and the discharge of its responsibilities in the public interest.

This, if it means anything, means that a greater freedom is given to the official side, because if on consideration any agreed plan is discovered to have unexpected implications, it could be overridden on the grounds of cabinet responsibility. However, the term that agreements become "operative" does imply an obligation that in all normal cases they shall be operative. As in all negotiating assemblies based upon "instructions," discussions must sometimes be adjourned until fresh instructions are obtained. There is no voting—each side acts as a unit: and therefore each side must find agreement beforehand. In the background, with its hands on the ultimate strings, is the Treasury.

No Act of Parliament founded the Whitley system. It arose out of a promise made by the government of the day. And whatever strength it has is drawn entirely from the needs of the public service and the character of the men and women who compose the councils. Most of the coun-

cils have done much good work in the matter of promotions, discipline, and the organization and conduct of office work; especially is this true of the departments where small devices have great value because of the largeness of the staff and the industrial nature of the work—in the Admiralty, Post Office, and the Customs and Excise councils.

Naturally the National Council has been active on a wide scale. It has reported upon and received the reorganizations of the general principles and methods of promotion; a Superannuation Committee has codified the complex superannuation regulations; a Committee on Further Education has made its report on provision for the further education of younger civil servants, and lectures have been arranged by civil service bodies and an internal and external diploma of public administration has been created in the University of London. A bonus and a sliding-scale system to meet varying price levels have been secured, and, perhaps most important of all, the regrading and reorganization of the civil service has been effected. In preparation for the tasks of reconstruction after World War II, the Whitley council played a central and magnificent role: no single step was taken without its advice and report.

What has been gained by the institution of the Whitley councils? Something very important psychologically has been gained when there can be a semipublic review of a foolish, untactful, or despotic show of authority <sup>17</sup>—when resentment of arbitrary interference with habit is avoided. Then, too, officials below the top grade have now a feeling that in regard to promotion, leave, and other official benefits, any jobbery is likely to be detected and quashed. Too much must obviously not be expected from the system by the staff side. However, it is quite clear, from the evidence given by heads of departments and representatives of the

<sup>17</sup> In the departmental councils it is open to the staff side to discuss any promotion when the accepted principles have been violated; disciplinary cases may also be presented for discussion if the staff side wish it.

<sup>16</sup> Clause 19.

staff, that the departmental councils have actually produced an invaluable and indispensable atmosphere of good and easy relationship between superiors and subordinates—that is the universal testimony.

The power of the associations behind the councils is still required to maintain real official respect for the cases they advocate, and we can surmise, though we cannot exactly count the number of, small benefits silently won without overt conflict by the mere existence of organized and recognized *vigilantes*. The evidence before the Royal Commission of 1929 shows that matters are not always discussed in the formal meetings of the councils, but informal discussions occur between the leaders of the officials of the staff sides, and settlements reached at once.<sup>18</sup>

We may pass over developments in Third Republic France very rapidly, for there were so few, and the world has nothing of value to learn from them.<sup>19</sup> The French politician was interested in other things, while the civil service associations were driven into a position of syndicalist extremism.<sup>20</sup>

Fourth Republic France introduced a veritable revolution in the status of her officials, following the most enlightened practices of the world. A Superior Council of Public Service (*conseil supérieur de la fonction publique*)<sup>21</sup> is established by the *statut des fonctionnaires*: it is presided over by the prime minister or his deputy (it is almost certain always to be the latter) and it is composed of twenty-four members nominated by the cabinet, twelve on the proposal of the civil service unions. It is concerned with the high level

of civil service policy and with the establishment of a minimum living wage, and it coordinates the work and views of the departmental councils of the same kind. Its recommendations are forwarded to the prime minister. Each department or service has established administrative commissions on a joint and equal representative basis of high officials and rank and file. Their competence includes surveillance—and in some cases participation—in the process of recruitment, efficiency records, promotion, discipline, and more generally all questions affecting personnel. The rank-and-file representatives are elected by the whole body of officials in the various departments and agencies respectively. In addition, there are in each agency technical committees on a joint basis which handle problems of organization or administration, making recommendations when asked for them—here the rank-and-file members are chosen by the trade-union organizations that are most representative.

*The Officials' Representative Councils of Weimar Germany.* Article 130 of the constitution provided that officials shall receive representative bodies by special law. Such a law was not passed, but individual departments established civil servants' committees (*Beamtenausschüsse*) temporarily to fill the gap, e.g., Ministry of Posts, Ministry of Justice, and Finance Ministry. The duty of the committee in the Ministry of Finance was to represent the interests of the officials before their superiors. The councilors were enjoined to act so that the sense of duty and joy of labor, the mutual confidence of subordinate and superior, were enhanced. Demands and suggestions of the staff relating to general personal affairs in the department were to be considered by the council and represented before the heads of the department. On the other hand, the superiors were to consult the opinion of the committee in the regulation of departmental routine and the hours of work, and in the laying down of principles for deputations, annual leave, sundry welfare institutions, and the re-employment of those dismissed from the

<sup>18</sup> The report, 1931 (p. 137 ff.) suggests hardly any change, except the extension of facilities for staff representatives to carry out their functions.

<sup>19</sup> Cf. Lefas, *L'État et les Fonctionnaires* (Paris, 1913). Cf. Ricard, *Droit et Jurisprudence en Matière de Postes, Télégraphes, Téléphones* (Paris, 1931), Chap. VII.

<sup>20</sup> Cf., for example, among the saner of those who desire the service turned over to the independent discretion of associations, Georges Mer, *Le Syndicalisme des Fonctionnaires* (Paris, 1929).

<sup>21</sup> *Statut*, articles 19 to 22.

service. And when the person specially concerned wished it, the council was to give its opinion on miscellaneous welfare matters like refusal of leave, recommendations to physicians, distribution of dwelling places, and the problem of whether or not there was a right to an addition to pay on the ground of place of residence. The various ministries in the *Reich* and in Prussia established committees of this kind—they were purely advisory.

The ministries did not treat the committees as alternatives to the civil service associations,<sup>22</sup> but they several times expressed their desire that no individual cases should be represented by the associations, though they were always ready to deal with any exceptional case where misunderstandings and errors could be swept away.<sup>23</sup> Of the tendency to carry individual grievances to the associations, the *Reich* Ministry of Finance and the Prussian Ministry of Justice complained. The latter<sup>24</sup> pointed out with considerable justice that the associations were not in a position to sift out the truth or falsity of the complaints. Consequently, the department was unduly bothered with communications. The complainant is not well served by such a procedure since his complaints must ultimately revert to the place of their origin for investigation. But if the Officials' Committee were at once approached, it could quash groundless demands and recommend the substantial ones. Prompt and just decisions can be made in this wise. The special evil of approaching the association was, however, this: that the committees did not receive the amount and degree of work they were well fitted to carry out, and confidence in them was generally weakened.

Until now [1922] it seems as if the recognition that the Official's Committees when properly employed can be effective in an extraordinarily fortunate way has not yet found general ex-

tension. They can reinforce a strong bond of confidence between the individual official and the departmental authorities, as well as avoid superfluous written communications. Without prejudice to the pending statutory regulation of official representative bodies, let the departmental authorities already begin to act in a fashion calculated to maintain the status of the committees in all respects, so that they may be in a position to fulfill their duty for the welfare of the civil service.<sup>25</sup>

Here is a problem which has arisen in the relationship between the trade-union organizers and the works councils in private industry. It is very difficult, excepting in special cases, to lay down a rule as to where the competence of the one begins and the other ends. There is much good sense in the remarks we have quoted above; and we calculate that they will everywhere be necessary. For there are always individuals with grievances and idiosyncracies who seek the stage as potential martyrs. There are those with a persecution complex, and other litigious to the extreme. It is a frequent thing to find a man or woman who prefers not to be tried by his or her peers, since chicanery and prevarication do not impose upon one's colleagues for long. And there are always ministers and heads of departments who do not like even the proper intervention of the association. Indeed, serious disciplinary problems are involved in the right to appeal from the head of the department.<sup>26</sup> The committees had not the executive force of the British Whitley councils, but they were nevertheless the moderators of minor distempers. The *Entwurf* (project) *eines Gesetzes über Beamtenvertretungen*, 1930, under discussion before the Nazi triumph is analyzed in the two-volume edition of this work (p. 1439).

*Grievance Committees in the United States Civil Service.* Thus, committees through which officials may represent their grievances are of exceedingly recent date. The United States civil service has

<sup>22</sup> It was, perhaps, owing to the strength and the ability of these associations that the councils have not fully developed.

<sup>25</sup> *Idem*.

<sup>26</sup> The Royal Commission on Civil Service reported, 1929, against centralized appeal bodies for this reason. Cf. also F. A. Bland, *Government of Australia* (Sydney, 1943), Chap. 13.

## REDRESS OF GRIEVANCES AND GUARANTEE OF RIGHTS

some such grievance procedures in a few agencies—beginning with the supervisor of the aggrieved official, going up to supervisors, and here and there an agency or departmental appeals committee.<sup>27</sup> The system is still upon its trial, and even at its best is confined to the minor adjustments of staff matters which are in any case troublesome to superiors, and occasional consultation on matters like the general principles of superannuation, classification and promotion. The maintenance of rights cannot be as yet entirely left to such instruments. Officials must still rely upon their associations for a show of power. There is no authority without an awe-producing element, whether it be spiritual, like the force of personality, the impressiveness of talent or the appeal of justice, or simply physical, varying only in the manner and strength of its application. It is hardly possible for the civil service at present to forego either the one or the other; but in proportion as institutions of the kind we have just discussed are developed and full scope given to the former, the threat of physical injury (which of course carries with it spiritual disablement) will become more and more dispensable.

The arrangements so far indicated are not concerned with adjustments of pay, but only Britain provides a special court for clauses regarding the pay, in relation to the working conditions of the service, among the countries with which we deal, though Australia has a fairly long experience of a civil service arbitral court. We indicate the main elements only of the English system.

Early in 1917 a Civil Service Arbitration Board was set up as a result of agitation by civil service associations because the War had sent prices sky-high while wages lagged far behind.<sup>28</sup> Two motives can be seen at work: the realization that "There is no worse tribunal in the world

for fixing a scale of wages than the House of Commons," and to free members of Parliament from intolerable pressure. The Board established by the executive authority of the government was to deal by conciliation or arbitration with questions arising with regard to claims for increased pay made by Government employees, except in the cases of industrial staffs, and where there was already recognized machinery applicable to the case. It referred only to posts under £500 a year. Suddenly as part of the general postwar attack upon government expenditure and the standard of living, the Board was abolished in February, 1922. The alleged grounds of abolition were that the Whitley Councils considered questions of remuneration. Now since the Whitley Councils can only declare and not enforce a recommendation this plea was fallacious, perhaps dishonest.

An intense campaign was conducted and ended with the reestablishment of the Board early in 1925. Its constitution is part of the industrial courts set up by the Act of 1919.<sup>29</sup> In the present case the court consists of a chairman who is either the president of the industrial court or the chairman of a division of the court, together with one member drawn from a panel of persons appointed to the industrial court by the minister of labor as representing the chancellor of the exchequer for the time being (this is the employers' representative), and one member drawn from a panel of persons appointed to the industrial court by the minister of labor after nomination by the staff side of the National Whitley Council. Civil servants and officials of civil service associations are ineligible for appointment as members of the court.

Only claims in regard to salaries of £850 and less can be referred to the court, unless by the consent of the parties concerned in the claim. When negotiation fails arbitration is open to the govern-

<sup>27</sup> The Executive Order of June, 1938, on the subject has not resulted in any substantial practical measures. See *Personnel Journal*, October, 1939, p. 151, *et seq.*

## THE GUARANTEE OF RIGHTS

ment departments on one hand, and the recognized civil service association within the scope of the National Whitley Council on the other hand, on application by either party. The matters which may be taken to the court are claims affecting emoluments, weekly hours of work, and leave. But claims can be made only for "classes," i.e., "any well-defined category of civil servants who for the purpose of a particular claim occupy the same position, or have a common interest in the claim."

This provision limits the work of the court, and were it not so, individual cases, and cases of small groups, where inequalities in respective pay and work were concerned would cause a continuous rush of claims for related adjustment, and destroy any stability for the Treasury and Parliament. The whole problem of classification would be reopened and never closed. This, of course, unfortunately imposes hardship on some officials, and the hardship is a direct result of largescale organization, and the exigencies of parliamentary control. Civil servants are generally satisfied that they have secured a very valuable piece of machinery for removing grievances. It is acknowledged that the court is fair, patient, and thorough. But one criticism is heard. The Treasury is the sole interpreter of the terms of the judgments of the court, and may take action before submitting its intentions to the court.

The staff side have requested that the Treasury be limited in its power of interpretation, and that, say, the Ministry of Labour, should decide between its view and the Treasury view; and that there should be some limitation on the action of the government affecting remuneration and conditions of civil servants without first submitting such matters to the judgment of the industrial court. The government has rejected such requests on the grounds of their general political responsibility, which requires that they shall not be bound,<sup>30</sup> but the decision is practically always followed by the Treasury.

The Royal Commission<sup>31</sup> recommended no change in the constitution or jurisdiction of the court, except a wider definition of "class." From 1925 to 1939 over three hundred cases were submitted to the court, a few by the staff side of the National Whitley Council, rather more by the staff side of the departmental councils, and the bulk on behalf of associations or groups of associations.

### THE GUARANTEE OF RIGHTS

How far does the state define the rights of civil servants—that is, the rewards and penalties of their work—and offer means of recourse against itself when the official feels these are violated? It is obviously unjust, and practically foolish, for the state to demand that civil servants shall deprive themselves of their defensive associations if it does not set up institutions which will offer them protection. All this raises many questions of formal law: the nature of the state as employer, the doctrine of autolimitation of the state's power, whether it is possible to sue the state. These questions have given lawyers, especially on the Continent, an enormous field of activity, and often caused them a tremendous waste of good time. For, in the end, these are not questions that can be decided by legal logic, and they would never have been raised did the state commence today without any legacy of its old absolute authoritarian self, a legacy which confuses the issue by setting up two fictions one against the other, state and subject. But we have learned that such problems are practically posed in terms of the interrelationship of social groups; and if we regard the present problem in this light, it is quite feasible—and not as may even be considered today, unnatural—to give the social group constituted by the civil service recourse against all the others who are served by it. It sounds different when we set the civil service and the state against each other. It has been otherwise in the past because

<sup>30</sup> Cf. declaration of Financial Secretary to the Treasury, March 9, 1926, and that of Prime Minister, February 2, 1927.

<sup>31</sup> Report of the Royal Commission on the Civil Service, 1929, p. 145 ff.

## REDRESS OF GRIEVANCES AND GUARANTEE OF RIGHTS

this opposition was construed into one of constant and necessary hostility. Though the last half century has witnessed a change of mind in this respect, there are still some who maintain the old tenets, and unfortunately the law has not yet caught up with even moderately enlightened opinion. Some countries still have sixteenth-century notions written and active in their statute books.

*England.* The British system still operates upon a legal basis as old as it is unjust. Arising out of the ancient doctrine that "the King can do no wrong," and that civil servants are servants of the Crown, it has been assumed that the Crown may dismiss its servants at pleasure.<sup>32</sup> No law or general administrative code lays down a scheme of disciplinary misdemeanors and accompanying penalties. A civil servant has no legal action against dismissal. His superannuation rights are ultimately determinable by the Treasury, for its interpretation of the acts is not challengeable in the courts. It may be pleaded that the head of a department would not hurt anybody unreasonably, and that the Treasury would rather be kind than cruel: unfortunately for human relationships, not all men are good or wise or well informed. Hence machinery is necessary to correct the deficiencies of men acting spontaneously.

The guarantee civil servants possess is the promise made by the Treasury in November, 1920,<sup>33</sup> as the result of a formula adopted by the National Whitley Council. This says that

except in cases which may give rise to criminal proceedings, full particulars of any charge against an officer's conduct shall be communicated to him in writing before any disciplinary action be decided upon.

The question of reports affecting promotion, that is, mainly the annual reports, was left to the consideration of the promotions committee; and this decided that in the case of adverse markings the

civil servant must be given a written intimation of his assessment, with particulars and reasons. Finally, when a report upon an officer in circumstances not covered by these arrangements reflects upon him adversely, he must be informed of the alleged defects in order to enable him to make explanations before the report is placed on record.

Nor does the Crown Proceedings Act, 1947, which permits private suits against the state, apply to the civil servants in his employment relationship to the state.<sup>34</sup> It does not imply a contract of service.

The Royal Commission<sup>35</sup> recommended that in serious cases the civil servant shall have the right to oral proceedings before a senior officer of the Department. He may have associated with him a colleague, or a representative of his association. In all cases of misconduct the charge is to be written and supported by a statement of facts. This was fulfilled by a Treasury Letter of May, 1935, which deprecated any standardized practice.

*United States.* In the United States the principles and methods derived from the same source as the English common law on this subject prevail, and no improvements have been made upon it. The power of dismissal has been made strict and absolute by the judgment in *Myers vs. U.S.A.* and *Morgan vs. T.V.A.* though the right to answer adverse reports or to appeal against disciplinary action is in a vigorous state of action and development.

*France.* In France the evolution since 1905 resulted in the establishment of a series of legal guarantees for civil servants. This development is the direct issue of two legal institutions unknown to Anglo-Saxon law: the suability of the public authority and action for excess of power. These are explained further in Chapter 36 on *Legal Remedies against Public Administration and Administrative Law*, but a short indication of their import is necessary here. The suability

<sup>32</sup> C. S. Emden, *The Law and the Civil Servant* (London, 1927). Confirmed in *Rodwell v. Tithe Exemption Commission* K. B. D., April 5, 1944.

<sup>33</sup> Circular No. 57/20.

<sup>34</sup> *Treasury Letter*, January 30, 1948; *Whitley Bulletin*, March, 1948.

## THE GUARANTEE OF RIGHTS

of the public authority' means that the state furnishes the opportunity for the challenge and the quashing of any of its actions which are inconsistent with the law, and redress for damage from the state. Such cases are ultimately heard by the *Conseil d'État*. Then, second, any person having a personal interest in such an *ultra vires* action may take proceedings in as easy and convenient manner as if he were conducting an ordinary civil action; in fact, the actions are easier to take.

For the safeguarding of his everyday working conditions, then, the French official has to look to two sources: first, his written or customary rights, and second, the *Conseil d'État* which will deny validity to any regulation or decision affecting him which violates the rights. As we have already seen, there is no single coherent statement of civil servants' rights: there are simply a number of decrees, rules of public administration, and departmental regulations affecting appointment, promotion, and discipline, and the financial and special laws of various dates affecting payment and pensions. All these establish interests for individual civil servants, and by the evolution of principles in case after case, the *Conseil d'État* has provided a sound guarantee of these interests. In regard to general disciplinary measures, the jurisprudence of the *Conseil d'État* is exceedingly extensive, since it was the first undertaken in point of time, before the middle of the nineteenth century.

The rules relating to appointments and promotion lists are maintained in this way. Dismissal, which is the greatest danger menacing an official, especially since it abolishes the title to a pension, is challengeable on the question of its regularity, its injustice, and its brusqueness.<sup>37</sup>

Where Councils of discipline are established and have not been regularly invoked before a disciplinary penalty has been imposed, the penalty becomes invalid. Many cases have been raised on the basis of the law of 1905 which gives civil

servants the right to inspect their personal records. The article says: <sup>37</sup>

All civil and military officials, all the employees and workers of all public departments have the right to the personal and confidential communication of all notes, memoranda (*feuilles signalétiques*), and of all documents composing their personal records, whether before being the object of disciplinary measures or a removal from office, or before being kept back in their promotion by seniority.

On all sides the *Conseil d'État* has hedged this right with defenses.<sup>38</sup>

What the French law has done, then, is to create the principle that a subordinate in the civil service is toward his superior in the position of an administered person. As the civil service may abuse its power *vis-à-vis* the ordinary citizen, so may the higher civil servants do to the lower.

Germany. The country in which rights and guarantees were most elaborately and firmly evolved was Imperial and Weimar Germany. If we reflect on what has been said about the jurisprudence of the *Conseil d'État* and then extend that to be perfectly comprehensive with every conceivable procedural guarantee, we shall acquire an idea of *Reich* and state guarantees to their officials. Every step, from admonition to retirement, was hedged with rules and procedural assurances. We have no space to recite the facts as contained in the various laws and regulations, or the machinery and procedure of decision.<sup>39</sup> We refer only to the general theory, known as that of acquired rights (*wohlerworbene Rechte*).<sup>40</sup> The Weimar constitution said (article 129): "The acquired rights of public servants are

<sup>37</sup> April 22, 1905, article 65. Characteristically of French legislative methods, this is in the Financial Act of the year. Cf. Librairie Dalloz, *Code Administratif* (Paris, 1930), p. 489.

<sup>38</sup> Cf. L. Duguit, *Traité de Droit Constitutionnel* (Paris, 1923), Vol. II, p. 150 *et seq.*, and G. Jèze, *Revue du Droit Public* (Paris, 1912), Vol. III, p. 75 ff., re disciplinary cases.

<sup>39</sup> Cf. A. Brand, *Beamtenrecht* (Berlin, 1928) and A. Schulze and W. Simons, *Rechtssprechung des Disziplinarhofs* (Berlin, 1926).

<sup>40</sup> W. Schroder, *Die Wohlerworbene Rechte der Beamten* (Berlin, 1930).

<sup>30</sup> M. Hauriou, *Précis de Droit Constitutionnel* (Paris, 1929), p. 587, and footnote.

inviolable." This gave rise to a vast literature of interpretation, and to several suits and judicial decisions. One representative of the officials went as far as to claim complete inviolability of rights in the future as well as the rights already acquired:<sup>41</sup>

The acquired rights are inviolable! The will and the clear phraseology have it that all rights belonging to officials ought not to be altered to their disadvantage. Thus this is not merely a program of the *Reich* Government, but, as previously said, a directly effective positive right. Article 129 of the Constitution by its form and purpose does not merely accrue to the officials employed at the entry into force of the Constitution, but it is effective for the future and guarantees also the acquired rights which were later established.

Some jurists were ready to claim that a constitutional amendment would be needed for any change in the status and salaries and working conditions of civil servants. Now, it is clear that changes of status cannot be for ever avoided; clearer still that civil servants cannot be granted complete immunity from the general fortunes of the society they serve, that their conditions of work and their salaries must to some extent be in fair relativity with the fortunes of all others in the nation. But the idea of acquired rights and of the constitutional guarantee was to produce carefulness, deliberation, and consultation, and to put a heavy drag on rough-shod legislative overriding of legitimate expectations. And among the things so guaranteed are classification, method of recruitment, rights to promotion, salary scales and increments, titles, rank, orders, symbols of honor, insignia and honors. There are elaborate rules concerning retirement, pensions, bonuses to the family, local cost-of-living bonuses, official dwellings, removal expenses, and travel; and the most minute prescriptions regarding disciplinary offences and the procedure (in order of gravity) of warning, reprimand, fines, suspension, and dismissal. The penalties are established with a split-hair exactness; and so also the detail of

the intradepartmental stages of action by the superior against the inferior official or the latter against the former. And, then, outside the department, rises the structure of the administrative courts leading to the pinnacle, the *Disziplinarhof* in Berlin.

Whatever the shortcomings of German administrative justice, it provided a system of redress open to all workers in the employment of the state, even the humblest; it acknowledged that the state may do wrong, and obliged itself to admit its wrongdoing in just rules and independent courts. No other country approaches this yet.

*The United States.* In spite of many suggestions made from time to time by the Civil Service Commission and the associations of civil servants, the federal service has no such comprehensive arrangements, systematic and authorized by law or executive order, as Britain, France, and prewar Germany. But the Civil Service Commission's recommendations to the departments that such shall be promoted has resulted in a great variety of cooperation between employees and the directing personnel of the departments and agencies. The National Federation of Federal Employees (which is not affiliated with either of the two major labor organizations), the American Federation of Government Employees (A.F. of L.), the United Public Workers of America (CIO), various craft unions, and unions of postal workers furnish the pressure to secure representation of the employees' point of view, and to clear up injustices and grievances.

Their pressure regarding pay levels is one exerted on Congress, rather than through joint councils, though the TVA has a notable annual wage conference, which under the terms of the statute settles the rates for the ensuing year. As to hours, leave, pensions, tenure, discipline, and promotion policies, the civil service rarely takes a step without the participation of the employee organizations. This is achieved through the Labor-Management Advisory Committee of the Civil Service Commission, which is a standing

<sup>41</sup> Hans Assmann, *Wohlerworbene Beamtenrecht* (Berlin, 1924).

## THE GUARANTEE OF RIGHTS

body, first established in November, 1942, consisting of two representatives from each of the three major unions, six representatives of management, and a member of the Commission as chairman. The committee has authority to initiate and recommend policies which will result in the effective utilization of personnel. This is reminiscent of the scope of the National Whitley Council in Britain; but it is not accompanied, as there, by departmental joint committees. In the departments, however, on occasion and from time to time, joint committees may be called, when they confer on working conditions, safety, in-service training, appeals, methods for adjusting grievances, leave, promotions, and so on. But, in the main, they are called only when particular grievance situations require attention.

It is a requirement in the departments that promotions, demotions, suspensions, dismissals, and other disciplinary action shall take place in accordance with the Commission's rules. Appeal procedures lead up to the Commission itself as the final instance.<sup>42</sup> Where an employee feels that he cannot of his own ability obtain just treatment, his organization will plead his case, and be admitted to do this. But this process does not include anything like the French departmental councils that keep watch and ward over the personnel record and promotions procedure.

On the whole, perhaps as a kind of compensation, American public employee unions are called before Congressional committees, during hearings on budget and other legislation, much more gener-

ally and as a matter of course than is the case in any other country.

We have thus observed the majestic and sweeping march of the democratic countries from the rigors and meannesses of the absolute state to the reasonableness and decency of the present time as regards the conditions of work, discipline, and reward of the state's own servants. This has not produced a decline in efficiency, but on the contrary has been coincident with marked improvement on the quality of the service rendered, not only as a result of the responsiveness of a democratic government to a sovereign people, but as a result of better administrative activity in a strict sense of the word. Justice and kindness are not lost. If the mind is applied to the subject, it is possible to formulate an interrelationship of duties and subordinations which must be observed for efficiency—the grand object being settled by frequent elections, and rights and guarantees, freedoms and generosity, which being observed lead to peace of mind, happier cooperation, and therefore to efficiency. It is better, in administration to give much and get much, than to give little and be served grudgingly and sourly. Outstanding in interest is the dissolution of the ancient hereditary rights to public employment. Above all in significance is the steady assimilation of the vital economic occupations under private enterprise to the conditions of public enterprise or civil service; and simultaneously the reverse process of easier, more flexible, personnel management and relationships in the latter—learned in many cases from the practices of private enterprise and publicly advocated by the civil servants' trade unions.

<sup>42</sup> Cf. Civil Service Law, Rules, etc., November, 1941, U. S. Civil Service Commission, and its annual reports.

## *Legal Remedies against Public Administration and Administrative Law*

Thus the state is continuously managed by a vast body of professional expert servants who contribute by their technical assistance to the foundation of law and carry it out. There resides in the legislature, and ultimately in the electorate, the power to correct error and vice in either of these functions, but as we have seen, these bodies are far too cumbrous to deal with a succession of individual cases—various in character and extremely complicated in substance. They have neither the machinery, procedure, nor capacity adequate to such judgment. If abuse of power is to be corrected, the specifically appropriate court of judgment and procedure are necessary.

Let it be remembered that when the statutes have given power to the officials, they should be able in that measure to act. The welfare of specified beneficiaries and the public in general depends on action. The search for infinite controls of "administrative finality" may defeat the laws, paralyze the official, and protect evil-doers.

The remedies available to the public to compel civil servants to do their work in accordance with law—which is a slightly narrower field than that indicated above—are regulated variously in different countries. Their importance has come into startling prominence since one by one the consequences of the growth of state activity have become clear. The is-

ssues raised, and still the subject of agitation, are: How can officials be restrained from illegally commanding, and forbidding, or executing acts?—how far ought an official to be suable in his own private fortune, and how far should the state be responsible for breach of contract and wrongful acts in the course of official duties?—and before what courts should such issues be judged?

These again arise from two considerations: the first from the financial inability (usually) of the average civil servant to pay compensation adequate to the damage done. The second consideration is more complex: the civil servant has duties of a peculiarly difficult nature, many of which involve (a) from technical considerations, immediacy of judgment, so that speed, for example, which may be the essence of success, may cause misjudgment; and (b) always the inevitable decision in favor of some individuals or social groups to the disadvantage of the property and amenities of others. Either of these may land a civil servant into trouble with some individual or group of citizens, and judgment of the legal rectitude of the action taken, which is the only point at present under consideration, should, if it were to be just, be undertaken only by those trained to an appreciation of the nature of the tasks, the functional responsibility, and the mentality of the official, judging by a pro-

cedure and with the statistical and documentary equipment appropriate to the issue.

The possibilities of official misbehavior are myriad. Power may not be used when it should be used. An official may go beyond the power granted by law. Power may be deliberately or unconsciously perverted to ends having nothing to do with the public service. Accidents may happen in the course of a proper use of power, to the detriment of citizens quite detached from the event. Or improper procedure may be adopted in the practice of official judgments. Or commands and prohibitions may be uttered without basis in law. Against these the citizen demands a defense and remedies. These should be specifically appropriate to the cases which occur, and regard must be had to the nature of official duties, while to rely, in cases of compensation, only upon the pocket of the official is to rely upon a vacuum.

The state of the law varies very much in different countries, owing to the peculiar constitutional history of each. England, which is so excellent in other things, was until very recently defective in this respect, the United States is little better, while France and Germany share the most honorable position.

*The Crown and the Citizen: to 1947.*

(1) Until 1947, the central authority, as a public institution, was not suable for tortious acts at all, and for breach of contract only by a favorable answer given to a petition of right by the attorney-general. The legal grounds of this immunity resided in the feudal foundations of the doctrine that the king can do no wrong and hence cannot wrongly choose or instruct his officials.<sup>1</sup> Behind it was the de-

sire not to have the public authorities hampered in the exercise of their power either at the time of exercising it or in anticipation of punishment by the courts after the event. And there are some functions of government which do not brook being so hampered: the keeping of order, the suppression of foreign enemies, and so on. Therefore, in the matter of tort, liability was upon the individual officials, and suit was in the ordinary courts and by ordinary procedure since no others had been established expressly for this purpose. As regards contract, the proper entity to be sued had to be carefully searched out in a multitude of legal hiding-places, and even when discovered, the Crown might and did defend itself by a dozen or so unconquerable weapons of procedure.<sup>2</sup> Broadly, then, the state had created for itself a privileged position regarding contract, with no basis of modern utility, but, on the contrary, considerable public disutility in which claimant groups were unreasonably penalized.<sup>3</sup> Some government departments, for some matters, were subject to suit, as the statutes which established their functions, for example in the case of commerce-like operations of the Post Office or Office of Works put their contracts on an ordinary basis. Furthermore, all the public corporations before and since 1945 included the right to sue and be sued.

As regards tort, whatever remedy was available was only against the individual official directly responsible for the act, and could easily be entirely inadequate in

<sup>2</sup> G. E. Robinson, *Public Authorities and Legal Liability* (London, 1925); and W. S. Holdsworth, "History of Remedies against the Crown," *Law Quarterly Review*, Vol. 38, p. 289.

<sup>3</sup> In 1822, C. J. Dallas (*Gidley v. Lord Palmerston*, 3 Brod. and B. 275) attempted to base the ministry of the servants of the Crown on this reasoning: "On principles of public policy, an action will not lie against persons acting in a public character and situation, which from their very nature would expose him to an infinite multiplicity of actions . . . The very liability to an unlimited multiplicity of suits would, in all probability, prevent any proper or prudent person from accepting a public situation at the hazard of such peril to himself."

<sup>1</sup> The early history of the doctrine can be traced in Ehrlich, *Proceedings against the Crown*, 1216-1377 (Oxford, 1921), Vol. VI; F. Pollock and F. W. Maitland's *History of English Law* (Cambridge, 1899), Vol. I, p. 516; and W. S. Holdsworth, *History of English Law*, 3rd edition (London, 1926), Vol. VIII, pp. 249-53 and 472-79.

terms of compensation to the grieved person, and was sometimes unfair to the official acting under administrative stress. The reason advanced for the maintenance of this situation was that it placed full responsibility on the official. This is true, though whether the psychological effect is always present, or always good, is a matter of considerable doubt; but the question arises, ought all the responsibility to be so placed? It is even questionable whether such responsibility is indeed, made continuously conscious, by the fear of punishment of this kind, in an official between the hammer of superior orders and the anvil of stubborn citizens or situations.

(2) A statute could make the Crown liable, but only by "express mention or necessary implication." Many statutes were invoked as "necessarily" implying the Crown's liability—without success, because the act was "a general enactment of the character of those enacted for the public safety," and the courts very strictly defined the term "necessary." This meant that the servant, in so far as he acted in an official capacity,<sup>4</sup> was immune from suit under such statutes. Yet this was an act of grace: there was no guarantee for the injured citizen.

(3) However, it was the almost invariable practice for the Crown to stand behind the official, to grant the petitions of right, and even to discover parties in cases of doubt, in order to make suits possible. Local authorities, being corporations, were assimilated to natural persons, and were, therefore, in relation to their own servants, in a condition of master and servant and were liable. However, the extension of central powers caused the local authorities to become, in certain matters, plainly an agency of the central authority, which so settled the terms of recruitment, dismissal, payment, and work that the service relationship was construed as one between the central authority and the servant. The result was that the central authority was immune from liability, the

local authority was relieved of it, and the only recourse was against the official individually.<sup>5</sup>

(4) Officials enjoyed certain common law or statutory immunities from action: so police officers, executing a warrant regular on its face, and customs and excise officers in the conduct of a search; so, in the delimitation to six months of the period within which actions for tort in the exercise of a duty (not a power) against all individual officials (local or central) who were liable;<sup>6</sup> nor was there an action against a superior officer for the faults of an inferior officer unless the faults were clearly the act of the superior servant.<sup>7</sup>

(5) Local authorities and central authorities were amenable to action in the ordinary courts to compel them to undertake their specific duties, and to question the legality of actions undertaken.

Thus, in England until 1947 there was for a large sphere of public administration in the central authority and under its close control no redress in tort against the state, but only against individual officials. Their wrongful acts, further, were protected by certain limitations and permissions. Any suit, moreover, was and is heard and decided by the ordinary courts of law. In contract cases the citizen was badly hampered against the government.

*The Crown Proceedings Bill of 1947.* Although the government acted graciously in the matter of tort and contract, what was needed was a statutory guarantee of rights. The first Labour Lord Chancellor, Haldane, set in train studies to remove the ancient obstructions to justice: and in 1927 a committee of legal experts under the chairmanship of Lord Justice Hewart (a Conservative in politics) reported the need for amendment, together with a draft bill to secure it.<sup>8</sup> Not until the Labour government of 1945 was the subject resumed, and in 1947 the government carried the Crown Proceedings Bill.<sup>9</sup>

<sup>5</sup> Cf. G. E. Robinson, *op. cit.*, p. 4 ff.

<sup>6</sup> Public Authorities Protection Act, 1893.

<sup>7</sup> C. S. Emden, *The Law and the Civil Servant* (London, 1923).

<sup>8</sup> Crown Proceedings Committee, Cmd. 1842, 1927.

<sup>9</sup> Public Statistics 10 and 11, Geo. 6, Chap. 44.

<sup>4</sup> Note the distinction between "performing public duty," and "his own personal act" (J. Wills in *Cooper v. Hawkins*).

The phrases of the Attorney-General, recommending the bill to the House of Commons deserve quotation:<sup>10</sup>

It will very greatly fortify that principle of equality for all before the law which all of us are agreed is a fundamental part of the British way of life, and not the less so when we are progressing toward the Socialist State. . . . I do rejoice that it should have fallen to the present Socialist Government to resolve the doubts and anxieties which have obstructed action . . . and to give Parliament as a whole the opportunity of enacting what this bill, in fact, does, that the rights of the little man are just as mighty, and are entitled to just the same protection, as the rights of the mighty state."

He observed that one of the reasons pressing towards the reform was the rapid development of the contacts between the state and the life of the citizen.

The Crown Proceedings Bill permits the citizen to bring actions against the Crown, that is, the government or state, in exactly the same way and courts "as if the Crown were a fellow citizen." A person can enforce any claim as of right regarding contracts and torts. The state will admit liability for the wrongs committed by its servants or agents as any private citizen or public corporation does. It will answer for negligence, wrongful acts, default by its servants or agents, breaches of the common law or statutory duties—e.g. under the factory acts—to those it employs, and for breaches of duty arising from the occupation of premises or land.

There are some minor exceptions, to do with the Post Office's services, and accidents in the armed forces to personnel while on duty. The latter, of course, are taken care of in the armed forces' pensions schemes. But there are two major limitations. One is that the prerogative of the Crown (the government)—that is, its still unwritten power to defend the realm, administer the armed forces in time of peace as well as war, its power regarding aliens, harbors, patents, and the suppression of disorder and the maintenance of peace—relieves the state of liabilities to suit. A certificate to this effect put in by

the Crown to the courts during pleadings will enable the courts to rule whether the limits of prerogative have been observed, or do not cover the action taken.

The second limitation of substance is that the state is not officially bound to produce documents which it believes to be in the interest of the public to keep secret. This leaves the government with power over definition of "public interest." The courts have, in the past, been unwilling to accept the responsibility of making such a decision. The government will take political responsibility for any attempt to hide what is material and what ought to be disclosed. In the course of discussion it was admitted by an Opposition speaker that some matters ought not be disclosed. For instance:<sup>11</sup>

If you are to make all confidential reports by civil servants disclosable, then the result will be that the state will not have the advantage of as clear, honest and forthright reports from its civil servants as it would have if they were protected.

*The Rule of Law.* Now, these present processes represent the contemporary result of what Dicey called the rule of law, by which he meant three things (of which only the first two are of importance here):<sup>12</sup>

(1) That no man is punishable or can be lawfully made to suffer in body or goods except for a distinct breach of law established in the ordinary courts of the land. In this sense the rule of law is contrasted with every system of government based on the exercise by persons in authority of wide, arbitrary, or discretionary powers of constraint.

(2) Not only with us is no man above the law, but [what is a different thing] here every man, whatever be his rank or condition, is subject to the ordinary law of the realm and amenable to the jurisdiction of the ordinary tribunals.

(3) The general principles of the Constitution are, with us, the result of judicial decisions determining the rights of private persons in particular cases brought before the courts.

<sup>11</sup> Sir D. Maxwell Fyffe, *Debates*, col. 1692, July 11, 1947.

<sup>12</sup> *Law of the Constitution*, 8th edition (London, 1930), p. 179 ff.

<sup>10</sup> *Debates*, July 4, 1947.

The Crown Proceedings Bill of 1947 has gone almost all the way to removing any obstruction to the rule of law in Dicey's sense, so far as the law and the rule cover the same ground.

*Administrative Jurisdiction.*<sup>13</sup> During the last forty years various government departments (which are not courts in Dicey's sense) have been made final courts of judgment in regard to many matters which fall within the scope of their work, which are not simply the narrow exercise of clear and indisputable powers, but are actually the construction of the law, an office usually fulfilled by the ordinary law courts. Thus the Minister of Health, the National Health Insurance Commissioner, the Board of Education, the Board of Trade, the Minister of Transport, the Railway Rates Tribunal, and other authorities, not being ordinary courts of the land or constituted as such, finally decide questions of fact so complicated and disputable as between parties—and thereby affect the person and property of the subject—that justice requires careful precautions. The appeal open to the citizen demands very careful procedure since the facts are technical and complicated, and the result affects property (let us say, a slum house) and the well-being of the public. Moreover, the fact that there is an appeal makes it look as though the department is a law court, owing to the appearance of a dispute between parties at law, or as the lawyers have it, a *lis inter partes*.

The essential issue is raised whether such procedure is or is not "judicial" in its nature. Was there something like "natural justice"? Lord Chancellor Haldane, in a very famous case, declared it was sufficient if the board acted judicially, saying that it must be "without bias, and must give to each of the parties the opportunity of adequately presenting the case made." The minister could not possibly be expected to do the work himself but must (and ought) to act vicariously through his officials. Oral hearings were

not necessary, nor was it correct to speak of the case as a *lis inter partes*. Beyond that the ultimate controlling authority was Parliament. The minister's judgment was unanimously sustained.

There is a considerable distribution of such administrative power,<sup>14</sup> and therefore Dicey's rule of law is, in practice, considerably modified. What is the significance of this power? This: that authorities which are not specially trained in adjudication, in aloofness, and which are as yet without procedure which leaves no doubts may take away liberty and property with redress,<sup>15</sup> though, it must be remembered the power to do so has been established not by them but by Parliament. On the other hand, the courts are nowadays faced with issues which they are not in a position properly to settle.<sup>16</sup> Yet neither the due safeguard of the individual called upon to surrender in the name of the community, nor the due safeguard of the social groups whom Parliament has decided ought to be benefited, should be unprovided for. The issue seems to invite in many cases a new type of administrative court in which the judicially trained and the administratively trained—served by their inquiry officers and acting under the well-known judicial forms of publicity, record, and evidence (with suitable modifications)—shall co-operate.

The report of the Committee on Minister's Powers (1932) put forward a number of principles which would offer safeguards to the citizen that the administrative departments were exercising their quasi-judicial functions judicially. There is no space to review them here. But they are designed to give the citizen due no-

<sup>14</sup> Cf. F. J. Port, *Administrative Law* (London, 1929).

<sup>15</sup> Cf. Lord Hewart's indictment, *New Despotism* (London, 1929), pp. 43-44.

<sup>16</sup> E.g., *Roberts v. Hopwood* (1925), 41 T. L. R. (444): "There are many matters which the Courts are indisposed to question; though they are the ultimate judges of what is lawful and what is unlawful to borough councils, they often accept the decisions of local authorities simply because they are themselves ill-equipped to weigh the merits of one solution of a practical question as against another. . . ."

<sup>13</sup> W. A. Robson, *Justice and Administrative Law*, 2nd edition (London, 1947).

tice, to make public inquiries necessary as a part of validity of judgment, to offer the citizen an opportunity of being heard, to place the act of judgment in the hands of judiciously tempered persons. This can be done, and not with great difficulty: it requires only the intention. What the committee was afraid of, and left to Parliament to watch, was that the intention would be weak. Their doctrine of ministerial interest is extremely interesting:

We think that in any case in which the minister's department would naturally approach the issue to be determined with a desire that the decision should go one way rather than another, the minister should be regarded as having an interest in the cause. . . It is unfair to impose on a practical administrator the duty of adjudication in any matter in which it could fairly be argued that his impartiality would be in inverse ratio to his strength and ability as a minister. An easy-going and cynical minister, rather bored with his office and sceptical of the value of his department, would find it rather easier to apply a judicial mind to purely judicial problems connected with the department's administration than a minister whose head and heart were in his work.

The Committee on Minister's Powers therefore wished Parliament to assign quasi-judicial powers to departments only exceptionally; and when they were so assigned thought they should rather be assigned to ministerial tribunals than to the minister. It must be admitted that in the majority of acts passed since that time, Parliament has not followed the advice given. It has felt that the danger of injustice was not so grave, and that somewhere a final decision must be made.

*Administrative Law.* Now we have touched upon a subject of the acutest controversy, but purposely without mentioning the name under which the controversy has been conducted—administrative law. For the introduction of the term Dicey is responsible. He borrowed the term *droit administratif* from France and gave it at once an erroneous and a sinister meaning. He takes his definition<sup>17</sup> from Aucoc's *Droit Administratif*, as follows:

Administrative Law determines (1) the constitution and the relations of those organs of society which are charged with the care of those social interests (*intérêts collectifs*) which are the object of public administration, by which term is meant the different representatives of society, among which the State is the most important, and (2) the relation of the administrative authorities toward the citizens of the State.

This would seem as clear as any definition can be. But Dicey is determined to find a sinister meaning in it, and therefore says: "These definitions are wanting in precision, and their vagueness is not without significance." He then proceeds to discard any comparison of the two countries in 1905, when the edition was written, and instead goes back forty years: that is, to the time before France created its modern means of redress against the state and before England began to destroy hers. He soon loses his historical interest, and begins the process of whittling away the borrowed definition until *droit administratif* appears (p. 329) to be nothing more or less than a body of rules for the protection of officials who have committed abuses of power against the citizens:

the fourth and most despotic [as though all the others were despotic, though less so] characteristic . . . of *droit administratif* lies in its tendency to protect from the supervision or control of the ordinary law courts any servant of the State who is guilty of an act, however illegal, whilst acting in *bona fide* obedience to the orders of his superiors and, as far as intention goes, in the mere discharge of his official duties.

Finally *droit administratif* is made to appear as only, and no more than, the generalizations from the judgments rendered in the special courts, the *tribunaux administratifs*, for officials in their relations with the public.

Let us be clear, once for all, on the real meaning of administrative law, or *droit administratif*, or *Verwaltungsrecht*. By *droit administratif*, Berthélemy means this:<sup>18</sup>

All the services which combine to the execution of laws, excepting the services of justice,

<sup>17</sup> A. V. Dicey, *op. cit.*, p. 328.

<sup>18</sup> *Traité* (as in note 26 below), pp. 1 and 2.

are administrative services, and *droit administratif* is the sum total of the principles according to which their activity is exercised. . . Administrative Law analyzes the mechanism of the Governmental machine. How the machine is constructed is taught by constitutional law. How it works, how each of its parts functions, is the subject matter of administrative law.

There is surely nothing sinister in this. It is a little vague, like all definitions, but it is intelligible and not disquieting. In England there is such a body of law: and wherever there is administration and law, there is administrative law. It includes statutes, conventions, and case law from the ordinary and the special courts. Similarly with the German synonym: *Verwaltungsrecht*. "Administrative law is the legal ordering of the relationship between the administering state and the subjects met in the process."<sup>19</sup>

If we take the lands of their origin as legitimately laying down the proper connotation of a term, then the most proper definition of administrative law in English is that by Port: <sup>20</sup>

Administrative Law is then made up of all those legal rules—either formally expressed by statutes or implied in the prerogative—which have as their ultimate object the fulfilment of public law. It touches first the legislature, in that the formally expressed rules are usually laid down by that body; it touches secondly the judiciary, in that (a) there are rules (both statutory and prerogative) which govern the judicial actions that may be brought by or against administrative persons, and (b) administrative bodies are sometimes permitted to exercise judicial powers; thirdly, it is, of course, essentially concerned with the practical application of the law.

In short, administrative law is no more mysterious or sinister than simply the law relating to public administration.<sup>21</sup>

We have dwelt upon this for two reasons. The first is to create a standard of criticism of the manner in which the term is used by some authors (Dicey, in the

past, and recent controversialists) who use it in the very narrow sense of such "judicial" action as is carried out by administrative boards and ministers, and the current popular notion that it means only law made by the departments in the form of rules and orders. These terms are dyslogistic; and therefore we come to the second purpose: to challenge the domination of an erroneous concept which inhibits reformative thought.

#### FRANCE

THE French monarchy of the *ancien régime* drew to itself all suits in which the authority of the crown was concerned, and it was able to do this because of its centralized strength, and the venal, if sometimes learned, composition of the *Parlements* which caused them to be despised by both people and monarchy.

In 1791 the ordinary courts were forbidden to handle administrative functions.<sup>22</sup> Beginning in the Year VIII, special bodies were created to judge administrative actions—the prefectural councils renamed *Tribunaux Administratifs* in 1953 and the *Conseil d'État*<sup>23</sup> above them and the ministers. And in addition, special bodies were established to decide such things as compensation to the state for the reclamation of marshes, and the institution of defenses against floods, and audit of accounts of public moneys. The administrative jurisdiction of the *Conseil* increased, and its *Section du Contentieux*, under the chief justice, took charge of it. The jurisdiction was favored by reason of its cheapness and promptness.

In 1831 the procedure of the *Conseil d'État* was reformed to assimilate it to that of the ordinary law courts (similarly for the prefectural councils, but not till 1862), and in 1848 the *Conseil* received the power to pronounce judgments instead of giving advice. The development of its jurisdiction was not unchallenged: liberals

<sup>22</sup> R. M. C. Dareste, *La Justice Administrative en France* (Paris, 1898).

<sup>23</sup> The *Conseil d'État* was primarily a legislative body, and a rule-drafting authority; it was also empowered to "settle difficulties arising in administrative matters."

<sup>19</sup> F. Fleiner, *Institutionen des deutschen Verwaltungsrechts* (Tubingen, 1922), p. 61.

<sup>20</sup> *Op. cit.*, p. 12.

<sup>21</sup> Finally admitted in Report on Ministers' Powers (London, Cmd. 4060, 1932).

like Dalloz and de Tocqueville tried, unsuccessfully to get all matters founded on statutory law and concerning nondiscretionary matters before the ordinary courts, leaving to the *Conseil* those founded on prerogative and discretion.

Up to 1872 the *Conseil d'État* had only the right of adjudication in specific cases; in other words, it could not possibly grow beyond the small elasticity of a few granted powers. In 1872 it acquired a general and sovereign authority in administrative actions thus.<sup>24</sup> This is the supreme court. There are then subordinate bodies in the localities, like the prefectural councils.<sup>25</sup> The *Tribunal des Conflits* decides in which courts disputed cases belong. This is a body not weighted to one side or the other, ordinary law-court judges or administrative judges, and so there can be no suspicion of undue influence on behalf of the government against the citizen.

The *Conseil d'État* itself consists of a large number of *conseillers*, *maîtres des requêtes*, and *auditeurs*. The first class give judgment while the two last classes prepare the judgments. The *auditeurs* are recruited by competitive examination from among those with the law degree of *licencié*. The *maîtres des requêtes* are recruited, to the extent of three fourths, by promotion from the *auditeurs*, the rest being appointed by the government at its discretion, while two thirds of the *conseillers* are recruited from the *maîtres des requêtes*, the rest being chosen at the government's discretion. The appointments at discretion offer a loophole for influence, but in fact, convention limits the government's choice to those high in the administrative service. This supplies direct experience of administration. Further, the *conseillers* are removable, but this does not occur, nor is the independence of this august body at all affected by the possibility.

The *Conseil*, the *Tribunal des Conflits*, and the administrative courts, administer between them a branch of law at once cheap and completely defensive of the

citizen against injuries by public administration, whether by quashing of improper actions or by the grant of damages. The results of their judgments are not embodied in a code, though that may one day come, but the rules, taken together, give every individual citizen the right to require the *Conseil d'État* to judge the legality and equity of every administrative decision, and to repair momentarily the destructive results of illegal or inequitable action.

We do not intend to pursue in detail the jurisprudence of the courts, but we simply set out the main conclusions which its activity justifies.

Let one be guarded against considering administrative justice as "exceptional" justice. That would be to commit a grave mistake and a serious abuse of language. Administrative justice is not a dismemberment of the justice of the law courts. It is the judicial organ by which the executive power imposes upon the active administration the respect for law. The administrative courts have not taken their role from the judicial authority; they are one of the forms by which the administrative authority is exercised. To put the matter even more precisely, it may be said that the administrative tribunals are, towards the acts and the decisions of the administration, what the Courts of Appeal are to the decisions of inferior courts.<sup>26</sup>

Since there are some administrative actions which are necessary in terms of government, where a multiplicity of actions is likely, and where, too, the official is involved in the habits and urgencies of a vast apparatus, there must be a limitation upon the power to sue officials personally.<sup>27</sup> A distinction must be made between acts for which the servant is personally liable and suable in the ordinary courts, and those which are the result of administrative faults, for which the service as an entity is responsible. Such limitations and distinctions may be by statute or decree or judgment of a court. In

<sup>24</sup> M. Hauriou, *Précis du Droit Administratif et du Droit Public* (Paris, 1932), p. 505 ff.

<sup>25</sup> *Idem*.

<sup>26</sup> H. Berthélemy, *Traité Élémentaire de Droit Administratif* (Paris, edition of 1926), p. 1072.

<sup>27</sup> Cf. L. Trotobas, "Liability in Damages under French Administrative Law," *Journal of Comparative Legislation*, February, 1930, p. 44 ff.

France, the *Tribunal des Conflits* makes the distinction, and its doctrine is to be found in a series of cases commencing with the *Pelletier* case of 1873.<sup>28</sup> These settle the distinction (from case to case) between *faute personnelle* for which damages can be obtained in the ordinary courts, and *faute de service* or *faute de fonction* for which a suit lies in the administrative—that is, specially constituted—courts.

*Faute personnelle* is extremely difficult of definition, but it has been defined by the great French administrative jurist of the last generation as "that kind of fault which reveals the man with his weaknesses, passions, and imprudences."<sup>29</sup> Duguit gives this formula: "when the act, accomplished on the occasion of the service, is, however, an act foreign to the service, it is called, according to the consecrated terminology, the *personal* fault of the official." Some samples are: an official (properly) posts an electoral list, but (improperly) it publishes the fact that one man, an electoral adversary, had been excluded therefrom because of bankruptcy; a tax inspector points out irregularities at a tobacco depot (properly) and accuses a boy of theft (foreign to his administrative power); a teacher teaches his pupils to read (properly), and makes revolting remarks about God (that is a personal fault). The distinction is between personal impropriety from pursuit of a wrong purpose, and error due to incompetence and mistake when pursuing a right object. There is a tremendous controversy about the definitions of *faute personnelle* and *faute de service*; we cannot here discuss which of the disputants is nearest the truth; but in many cases the practical distinction is exceedingly difficult. Personal faults are judged and decided before the ordinary law courts; service faults before administrative courts, i.e., in the

localities, the prefectural councils,<sup>30</sup> and the center, the *Conseil d'État*.

The state and the municipalities are responsible, can be sued in the administrative courts, and may be compelled to pay damages for any prejudice to property or life caused by defective action<sup>31</sup>—for a *faute de service*, that is, as Hauriou says, "the negligences, the omissions, the errors which are among the habits of the service, when those habits are bad." French jurisprudence speaks of a *grave* (*lourde*) fault; the idea being that it is beyond the average incompetence to be expected among the mass of men and officials.<sup>32</sup> Compensation by the state was admitted in the Revolutionary period in regard to property and public works, and is well established in the case of breach of contract; much of that is a development from the guarantee of individual property in the early constitution.<sup>33</sup> In this background the official may err by *excès de pouvoir*, that is, by going outside his legal powers; and one remedy is annulment of the act upon promulgation and before injury occurs (*recours pour excès de pouvoir*) or if the act causes injury, there is action for indemnification (*recours contentieux*). There are even signs that in the case of sheer unavoidable accidents, the public authority is responsible.<sup>34</sup> Such are cases where the fault complained of is not simply caused by *force majeure* (i.e., a purely external and totally incalculable and unavoidable factor) but by a fault of the service which cannot in the present state of science be assigned to specific cause.<sup>35</sup>

<sup>28</sup> Cf. for their composition and activity, Bérthélemy, *op. cit.* (1930 edition), p. 1108 ff.

<sup>34</sup> Duguit, *ibid.*, p. 469 ff.

<sup>35</sup> *Couëtias*, November 30, 1923. Larnaudé thus expresses the theory we have indicated above: "When this vast machine, called the State, a hundred times more powerful and a hundred

<sup>28</sup> This case was not fought to saddle the government with fault and compensation, but to guarantee officials against the abuse of the right to sue them.

<sup>29</sup> E. Laferrière, *Traité de la Jurisdiction Administrative*, 2nd edition (Paris, 1888), Vol. I, p. 648.

Now, not only is the state prepared to accept responsibility and pay damages for its own faults, but in some cases it pays damages for its officials convicted of a personal fault. This development is of late growth and owes some of its strength to the theoretical work of M. Jèze, who in connection with two famous cases<sup>36</sup> argued that a personal fault was always graver than a service fault and that the state should accept liability not on the basis of any fault, but as offering insurance against social risk of damage from the public services.<sup>37</sup>

Yet there are warnings against an extension of this practice, lest the official escape from personal responsibility altogether.<sup>38</sup>

We have already shown how the professional rights and duties of officials have been included within the jurisdiction of the administrative courts.

Finally, procedure is simpler than that of the ordinary courts and inexpensive.<sup>39</sup>

Thus we may say that in France, every illegal official act is challengeable either in the ordinary courts or in special courts where procedure, composition and doctrine give very generous guarantees that only that will be done which is legal, that only the legal which is done competently and with a proper motive will be permitted, and that a cheap and simple process will cause annulment and produce indemnification by the public authority responsible, and that even a personal fault may in many cases be indemnified by the public authority. One has only to analyze the judgments given by the *Conseil d'État* to

realize what remarkable acumen has been applied to the problem of reconciling the process of government with the claims of individuals, and the close connection between the *Conseil* and the development of administrative science and law by academic masters.

## GERMANY

THE legal redress of official infractions of the law or maladministration reached highly systematic and secure conditions in Germany (allowing for the hideous but transient reversion to barbarism between 1933 and 1945). This seems to be due to three things: the desire to secure a legal control of the administration, where for so long a political control was weak; a special love of law which was signalized by observers centuries ago; and the development of the theory of the *Rechtsstaat*, that is, the state which shall not act arbitrarily but only in accordance with law and morality. This latter was the contribution of liberal thinkers to German constitutional development. These, until the last quarter of the nineteenth century, sought a solution in the transfer of administrative jurisdiction to the ordinary courts, using the French differentiation of act of authority and simple acts of administration as a division between what should be left to the departments to correct and what should come before the ordinary courts. They pressed to its utmost what the German Conservatives had denied: the separation of powers. Indeed, the Frankfurt constitution of 1849 expressly prohibited administrative tribunals.

It is to Gneist, the constitutional and administrative historian, that modern German notions and institutions of administrative justice are due, for in his *Der Rechtsstaat* he demanded the creation of special administrative courts in the localities and at the court, formed of several members, and in the localities aided by unpaid laymen.<sup>40</sup> This offered

times more dangerous than the machinery of industry, has injured some one, those in whose interest it functioned when the injury was caused, must make restitution; the principles of solidarity and mutuality upon which our institutions are based, require it." <sup>40</sup> Published 1871, first as an allocation to the jurists who were members of the first German Reichstag.

the possibility of a reconciliation between the necessities of the administrative services and the need for judicial protection of individual rights. State after state began from 1875 onward to construct a system of administrative courts. The essence was to subject the public authorities to a regular control through special courts set in motion by actions by citizens, and to give this action a guaranteed basis, not a precarious one as the police state of the eighteenth century had, when it of grace permitted actions to be brought by citizens against it in the ordinary courts.<sup>41</sup> Gierke's formula is, "The *Rechtsstaat* is a state which sets itself not above the law but within it."<sup>42</sup> The result has been the growth of a system of jurisprudence in every respect honest and appropriate to administration and citizen. We shall consider its salient features presently.

The *Fiskus*. German jurisprudence recognizes the distinction between public and private law, and within the latter an old doctrine teaches the personality of the state as the bearer of rights and duties like any ordinary person, sole or corporate. Now this doctrine of the state's personality may (as Duguit has spent hundreds of pages in proving) have the evil effect of confounding the individuals with the state, and so of making the state almighty. But it has its very useful side in that the personification provides a suable entity: the *Fiskus*. This body, in all the government departments in which it is resident, has all the rights and duties in contract and tort of an ordinary individual or firm, and the suit lies in the ordinary courts. The courts proceeded further and created a doctrine of indemnification for damages to the recognized rights of the subject, and these covered both statutory rights and those of natural justice, or "subjective rights," as they are called in Germany.<sup>43</sup>

In the nineteenth century the liberal movements then went further along the line of the *Rechtsstaat*, to control the complex administrative relationships which were fast developing, while doctrine now identified the *Fiskus* with the state, but only on its property-law side, and practice confined this only, and not the new developments, to the civil courts. In the field of acts of authority by public administration, the new courts, administrative courts, became the givers of justice.

Article 131 of the Weimar constitution, especially by its extraordinary application by the *Reichsgericht*, ran:

If an official violates his official duty toward a third person in the exercise of public authority entrusted to him, the responsibility fundamentally rests with the state or corporation in whose service he is. Retrospective action against the official is reserved. The ordinary course of justice may not be excluded. The appropriate statutes shall make any more detailed regulation.

This unassuming article was so constructed by the *Reichsgericht* that it may be called the *ultima ratio* of the *Rechtsstaat*.

Thus the state took all liability for its officials (the immediately employing body, *Reich*, state, or local authority was liable). The person who had committed the error was no longer of concern,<sup>44</sup> and when an official was jointly provided for by a number of authorities, one or the other was judged liable. The decisions of the *Reichsgericht* and the state courts made the distinction, with which we are already familiar, between faults which are clearly of the service and those which are personal faults of the official. Here, as in France, the line was not easy to draw in marginal cases, and there were occasional anomalies. As in France, the wrong must have occurred in a duty toward a third person, not simply in a voluntary service which the law does not enjoin. Finally, the wrong must have occurred by intention or negligence.

The official was personally liable for

<sup>44</sup> *Reichsgerichtshof*, Vol. III, October 5, 1920.

<sup>41</sup> Otto Mayer, *Deutsches Verwaltungsrecht*, 3rd edition (München, 1924), Vol. I, p. 54 ff.

<sup>42</sup> *Zeitschrift für Staatswissenschaften*, Vol. XXX, p. 190; I. Mayer, *op. cit.* p. 56. "The

criminal actions, as included in the Criminal Code, in the course of official duties: e.g., corporal injuries, violation of freedom, constraint, and torture. The jurisprudence of the *Reichsgericht* maintained that the "previous question" (*Vorfrage*, or *Vorentscheidung*), whether there was at all violation of official duty, must come before the ordinary Courts.<sup>45</sup> That is, there were practically no relics of administrative prejudice in tribunals of Conflict or their like.<sup>46</sup>

There was a class of case in which a wrong has been done, but where the fault could not be called culpable. This was similar to the French differentiation between an average or normal fault, which lies in the normal nature of men and the service, and a grave fault. It is for the grave fault that the servant or the state is liable in France; it was for the grave fault only that the servant or the state was liable in Germany. When the fault was normal, unavoidable in the normal state of human nature, no one was responsible (so according to the terms of the Civil Code, 839). But sundry statutes made exception from this state of affairs and positively asserted state liability in specific matters. So in various statutes regarding damage caused by riots when the public authorities were impotent to intervene effectively. Yet where such laws were not existent, the immunity of official and state ceased where the illegal action redounded to the advantage of the state. This was similar to the French tendency to compensate for risk, that is, where public works or activities caused special injury to a citizen.

The state or *Reich* could demand satisfaction from the official for the damages it had to pay, but his liability ceased to exist after three years. The officials of local authorities were in the same position.

Officials might claim that they were not responsible.

All this so far is concerned only with the amenability of the official and the official institution to the ordinary courts, though in the background there is the disciplinary relationship between official and state, a subject we have already analyzed in Chapter 34.

The intention of administrative jurisdiction was to secure that the orders of public authorities be legal by regard both to written law and to natural justice respecting life, liberty, and property.<sup>47</sup> It was their duty to state the law when that had been challenged, as it was the business of the English local government board to state what was right in the dispute between Arlidge and the Hampstead district council. Their work was recognized as of a contentious-judicial nature, and therefore they were established with the conditions of independence of mind. But since the subject which they had to judge is one—government—of a complicated technique, they were given the conditions, too, which would make this possible.<sup>48</sup> So far did opinion change since 1849 that whereas the administrative courts were constitutionally forbidden, the constitution of 1919 expressly required their creation: <sup>49</sup> "In the *Reich* and the states, administrative courts shall be created, according to statute, for the protection of the individual against orders and rules of the administrative departments."

Each state had its own system of courts, and although there was a movement for a *Reich* Appeal Court, such was not established.<sup>50</sup>

The Superior Administrative Courts in Prussia and the larger states were judicial authorities independent of the administrative apparatus, but in other states there were various kinds of connections with

<sup>45</sup> This is on the basis of article 131 and 11, Introductory Law to the Judicature Act (*Einführungsgesetz Gerichtsverfassungsgesetz*). But the courts are permitted to exclude the procedure up to the decision of the question whether the challenged behavior of the official was legal.

<sup>50</sup> *Verreinigung der deutschen Staatsrechtslehrer* (1929); *Wesen und Entwicklung der Staatsgerichtsbarkeit: Überprüfung von Verwaltungsakten*; also *ibid.* (1925), *Der Schutz des öffentlichen Rechts*.

the administrative departments, or the ordinary courts. In Prussia the court was composed of a president, several Senate presidents, and councilors, all of whom had life tenure and were removable from office only by a decision of the full court. One half the members had qualifications for a judicial office, the rest for the higher administrative service.<sup>51</sup>

Procedure before the courts was in the form of a *lis inter partes*, i.e., a contest between parties, these being either individuals who opposed each other, or public authorities against each other, or the public authority against individuals,<sup>52</sup> and they were to each other as complainant and defendant in civil actions. Procedure was public and oral. Not only might the parties demand a review before the highest court, but other persons might require review on the grounds that the public interest was involved in the magnitude of the issue.

The main lines of the German system are clear. The citizen had good guarantees that the administration should not act outside the law, and damages were available from the public treasuries, while officials were well protected in their professional rights. Except in the lower instances there was no suspicion of *raison d'État*, since the courts were independent and properly trained, but some, though not serious, criticism was leveled against the admixture of administration and jurisdiction in the lower instances and the danger of political bias in the selection of the lay element, yet even there the lay element was recognized as a protection against bureaucratic perversion of power, and as a contributor of a special expertness, viz., that of the knowledgeable man in general social life. There was not a single Court, but a number of unrelated tribunals. They were the Reich Economic Court, the Insurance Court, Private Insurance Court, the Finance Court, the Settlement Court, the Patent Office, the Public Assistance Court.

Doubts have been expressed regarding the merits of administrative justice compared with the capable and impartial judgment in the ordinary courts; but on the whole they have succumbed to the consideration that the administrative courts were both independent and yet capable of judging propriety, legal and circumstantial, in government, a matter not so much within the capacity of the civil courts.

*Limits to Remedy.* One final point is worth mention. Everywhere there is a point which the courts and the law hold to be unreviewable and unchallengeable: this is what is called variously "discretion," *freies Ermessen*. What does the phrase mean? It means that the courts act with an eye to the reasonable conduct of reasonable men. Not to do this would be in every case to attempt to substitute their judgment of persons, facts, and expediency for that of the officials who are actually immersed in the thousand details and their conjuncture which call for their action or forbearance. Hence the courts make allowances for circumstances of time and place, especially situations of emergency, sanitation, civil disturbance, and military aggression. They refuse to prosecute the official's decision and effect beyond a certain point. If, in fact, they did not practice this forbearance, all administration would be paralyzed by fear of error. They allow, in American terms, "administrative finality."<sup>53</sup>

Somewhere, in short, the law courts must leave the officials' judgment free of challenge—not on law, not altogether on procedure, but on facts and expediency of action.

#### THE UNITED STATES

THE American federal authority has enjoyed an advantage over England, and suffered a great disadvantage: there has been no fiction of the infallibility of the government (Crown), but there has been

<sup>51</sup> Dieckmann, *Die Verwaltungsgerichtsbarkeit in Preussen* (Berlin, 1926), p. 41 ff., for the composition of the various courts.

<sup>52</sup> Cf. Dieckmann, *op. cit.*, p. 52.

<sup>53</sup> J. M. Landis, *The Administrative Process* (Yale, 1938), Chapter IV; Milton Katz, *Cases and Materials on Administrative Law* (St. Paul, 1947), Chapter VII.

the obstacle of the separation of powers. Yet while the latter has been steadily palliated by the partial vesting of judicial functions in administrative bodies, and the assumption of administrative powers by the judiciary, the state was not made liable for the torts of federal officials, and the doctrine of nonsuability of the state is well established.<sup>54</sup>

The state is not liable for torts committed in its service; executive officers are themselves civilly liable for illegal and unconstitutional acts done in their official capacity,<sup>55</sup> and cannot plead the orders of a superior officer. Where the officer has acted legally, but with unwise use of discretion, there is no liability.<sup>56</sup> Relief was obtained by petition to Congress for private bill, gravely encumbering its Claims Committee. But Public Law (601) of 1946 admits torts claims to a maximum of \$1000 before any United States district court where the tort was committed while the official was acting within the scope of his office. Of course, no action is good where the act is exercised with due care or is discretionary.

There are the rights to obtain injunctions against illegal and unconstitutional

activities, mandamus to compel the performance of nondiscretionary acts and to compel the exercise of discretion, but this does not extend to direction of the exercise of discretion.

During the last thirty years or more, the establishment of government corporations for commercial or industrial operations (for example, the TVA) has always been used to make the corporation suable as a private corporation or person would be. In fact, the courts are ready to accept the liability even where it is not expressly prescribed in the corporation statute.<sup>57</sup> Furthermore, the government may—and as in Britain before 1947, did—in special cases permit suit, and Justice Frankfurter indicated many of these in the *Keifer* case cited above. The most general of such permissions applied to contracts.

As regards contracts, the regime of petitions to Congress gave way in 1855 to the Court of Claims "to hear and determine all claims founded upon any law of Congress or upon any regulation of our executive department, or upon any contract, express or implied, with the government of the United States."<sup>58</sup> This and subsequent amplifying legislation and the judgments of the Supreme Court have carefully excluded the consideration of cases which "under the assumption of an implied contract, make the government responsible for the unauthorized acts of its officials, those acts being in themselves torts."<sup>59</sup> The Court of Claims is composed of judges holding the tenure *quam diu se bene gesserint*, and are appointed by the President, by and with the consent of the Senate. In evidence and procedure it is analogous to other courts.

<sup>54</sup> Cf. K. Singewald, *The Non-Suitability of the State in the United States* (Johns Hopkins University Studies, 1910), and R. D. Watkins, *The State as a Party Litigant* (Johns Hopkins University Studies, 1927). Watkins (p. 55) says: "We adopted it [the doctrine] without considering whether it was valid, essential or desirable . . . Historically there seems no other explanation than simply it was accepted by us as something belonging to the normal course of things." So until 1868 when a doctrine of utility was invented: *The Siren v. U.S.* (1868).

See especially J. D. Block, "Suits against Officials and the Sovereign Immunity Doctrine," *Harvard Law Review*, September, 1946, p. 1060 ff.

<sup>55</sup> Cf. Joseph Story, *Commentaries* (Washington, 1833), Sect. 1671, *U.S.A. v. Lee* (1882), 106 U.S. 196; *Cunningham v. Macon and B.R.R. Co.* (1883), 109 U.S. 446, 452; *Poindexter v. Greenhow* (1884), 114 U.S. 270.

<sup>56</sup> "Whenever from the necessity of the case, the law is obliged to trust to the sound judgment and discretion of an officer, public policy demands that he should be protected from any consequences of an erroneous judgement"—*Downer v. Lent* (1856), Col. 94. Yet malice, bad faith, and corruption, seem to leave an opening for recovery.

<sup>57</sup> Cf. also R. Cushman, *The Independent Regulatory Commissions* (New York, 1941); David Lilienthal and R. H. Marquis, "The Conduct of Business Enterprises by the Federal Government," *Harvard Law Review*, February, 1941. Cf. also *Keifer* and *Keifer v. Reconstruction Finance Corporation*, 306 U.S. 381 (1939); and J. McDiarmid, *Government-Owned Corporations* (New York, 1939).

<sup>59</sup> *Gibbons v. U.S.A.*, 8 Wall, 269

The most interesting and instructive developments in the sphere of administrative jurisdiction are those in the various great commissions like the Interstate Commerce Commission, the Commissioner of Patents, the Federal Trade Commission, and others, some of whose functions, the continuous and regular application of the law to very complex economic and technical phenomena, have been recognized by the Supreme Court of the United States to be judicial.<sup>60</sup> From these, however, after the advantages of administrative jurisdiction have been exploited, appeals are properly permitted.<sup>61</sup> We must leave to the reader the study of their technique, their safeguards for social as well as individual justice, and their relationships with the ordinary courts and with the institution of "due process" (previously described, p. 144).<sup>62</sup> Here only this need be said that various statutes require for the making of diverse rules and orders a procedure of notice to the public, of hearings, of consultations, conferences, even of "adversary" hearings. These have in many cases been independently developed by the administrative agencies, or

have been evolved under the impetus of judicial decision. Further systematization was attempted by the Walter-Logan Bill (vetoed, see p. 103 above). Finally, the lawyers had their way in the *Administrative Procedure Act* of 1946. This code of rules for rulemaking and quasi-judicial action of the departments is very elaborate and perhaps excessively clogs the administration at every stage of official initiative by offering opportunities to those aggrieved or about to be aggrieved to appeal to the courts for injunctions to refrain from action or to command action.

It must be remembered, of course, that the individual official who wrongs any party is himself liable to suit for damages, as in British law. Only in the cases we have mentioned does the government stand behind him to accept suit and pay damages if its functions carried out by its officials have injured others.

We have now surveyed the problems raised by the administrative features of the modern state in their evolution and contemporary form. We have seen the rise of the civil service, the forces which governed the formation of its character in different countries, and the influence of social forces, and democratic institutions upon its present qualities. Three features emerge, pronounced and striking: the search for impartial expertness; the attempt to control, legislatively or through the Courts, its potentially aberrant actions; and the attempt to reconcile police and ministrant functions with the freedom and security of the civil servant. These are still problems: they are unsettled; they are lashed by the flux of social forces. Yet what is the attitude of the public—the sovereign public—to these mighty machines of government and the conditions of their operation?

<sup>60</sup> F. J. Port, *op. cit.*, p. 276.

<sup>61</sup> This review is "limited substantially to two questions, first, whether there was evidence before the administrative body upon which reasonable men might fairly have arrived at the conclusions reached; and second, whether any rule or principle of law was disregarded in reading them." J. Dickinson, *Administrative Justice and the Supremacy of Law* (Yale 1927), p. 190.

Report, *Administrative Procedure in Government Agencies*, committee appointed by Attorney-General, Document No. 8, 77th Congress, 1st session; *Administrative Procedure Act*, Legislative History, 79th Congress, Senate Document No. 248, 1944-46; Walter Gellhorn, *Administrative Law, Cases and Comments* (Brooklyn, 1947), and J. K. Hart, *An Introduction to Administrative Law and Cases* (New York, 1940).

## *The Public and the Services*

THUS a multitude of laws and practices establish, direct, and control the public administrative services. What is the result? What do they produce? What does the public think of the product, and what ought it to think?

In every country there is a vast body of men and women drawn to the professional service of the state. Everywhere, and with few exceptions, they are highly educated, formally, in relation to their duties and to their counterparts in non-public industry, and this in spite of the "crammers" who live upon examinations. Yet this education and the related formal tests are nowhere entirely appropriate to the specific tasks to be performed, and the world is as yet merely stumbling toward a proper method of preparation and selection for the public service. For the truth is that under the common rubric of the "public service," and even within its broad general classes, the tasks are multifarious, each calling for a special aptitude—a different combination of "service elements" as the American administrative scientist would say.

In private industry there is supposed to occur a continuous process of selection by competition, and a minute adaptation to the local and personal diversities of the consumer. The profit incentive, the danger of bankruptcy, and the singleness (if narrowness) of mind of the businessman often produce this result. Hitherto, however, the public services, local as well as central, have concerned themselves rather

with the production of wholesale quantities of uniform products at the margin of urgency, than with the creation of individual satisfactions in the vast field of individual desires. The developments of the last quarter of a century, however, in state and municipal ownership and management, leave no doubt that the field of their legitimate and useful operations is very large, and quite as large is the variety of forms in which they can become effective: there is a judicial control, judicial-cum-administrative control, administrative control, and complete state ownership and operation, and of these there are many subtly different varieties, from complete administration in a centralized department to high decentralization and quasi-public corporations.<sup>1</sup> The tests of capacity must be correspondingly diverse.

The clerk in the colonial office, the inspector of education, the director of the electricity department, the chief of a savings-bank division, the diplomatic service, the Treasury examiners of estimates—for each of these there is the optimum training. So far, capacity to learn, tested generally, and such attributes of character as honesty, vital to the public services, have been sought. They are not enough. The simple motives of security, respectability,

<sup>1</sup> Cf. Herman Finer: *The T.V.A.: Lessons for International Application* (International Labour Office, 1944); and Herman Finer, *Municipal Trading* (London, 1941); also Herman Pritchett, *T.V.A.: an Administrative Study* (Chapel Hill, 1943).

and social prestige, especially of the great classes of the disinherited in a modern society, may have been enough in a world where only one twentieth or thereabouts of the productive population were civil servants, and where initiative had not hitherto been of first importance; but they are insufficient in a dynamic state.

All the civil services show remarkable zeal, but the law and the nature of the service tend to confine this zeal to rigid and narrow channels. The exhilaration of adventure and conquest does not exist, while legal permissions and prohibitions which surround the task and the office produce a cautiousness, sometimes a veritable misanthropy. *Le règlement* is not only the excuse for sloth, but sometimes really causes it.

Moreover, the slowness of personal transfer and circulation, and the sense that there is an "establishment" which nothing can alter, engenders and nourishes the feeling that one is in a rut from which it is not worth while to attempt to emerge. Incentive is blunted, and discouragement sets in, and leisure comes to be enjoyed rather than applied. Yet there are conspicuous examples of men who have found themselves in the service of the state, and whose impersonal passion for their work survives the temptations of an acquisitive society and the comparative smallness of their salary, so that the state is often served at one half or one quarter or even less the rate of pay obtainable outside its ranks. Such men and women, put into key positions, are of inestimable value as the leaders of their staffs, especially the younger generation. Give men significant public work with decent, not extravagant, rewards, and the talent available is more than abundant.

Public responsibility produces a tendency difficult to resist. It is overroutinization and overconscientiousness. In the end, whatever the technical answers to technical complaints, the state services have to reply to the public in or out of the legislature, in terms of the cultural or civilization value of their actions. Too often the quantitative answer which settles, if it does not convince, the com-

plainant or opponent is, by nature, not available. A linguistic answer must be given. That is, it must be persuasive, and as the office must answer for it, two things occur: the reports go from official to official up the hierarchy to the chief, and, when in doubt, risk is not taken so much as passed on, and records must be made, kept, and consulted as the warrant of justification. Time and audacity, the mother of invention, are apt to be lost, all around.

The power of the state is immense, and whether as policeman or tax collector, or licenser of automobiles, or controller of agricultural research—whether as gas works or passport office—it confronts the citizen with the aspect of inescapable doom. The civil servant is part of a machine of domination, and accession to office, according to reports from all countries, tends to produce in him an overbearing attitude which sometimes merges into tyranny. This, even when it falls short of legally challengeable misfeasance, can be extremely painful. Roughness and authoritarianism is infrequent in England, as the service has always been confronted by a strong Parliament and sense of self-government, but there is a growing dislike of the expert, founded partly upon his prevalence and partly upon public ignorance. France has more of it—partly owing to the tradition of *la puissance publique*—partly to the French petty bourgeois veneration of officialdom (when they or their relatives are, or are likely to become, officials)—and partly to the official's defensiveness against a critical and sarcastic public, out of self-compensation for the insults and reprimands showered downward in a strongly hierarchical system, and out of the spontaneous sullen malice of the miserably underpaid.

In Germany the services have still the authoritarian tradition, an intentional sternness. But all that a nation can do is being done to smooth the rough edges and convert officiousness into good offices. The civil service schools and associations work for this end. The constitution declares the rights of the public very clearly: "Every German has the right to make requests or complaints to the competent de-

partment or representative body in writing." In fact, even before this declaration of rights was made, the public was very ready to approach officials, especially the local *bürgermeister*, who in some cases is looked upon as a veritable Providence. Why not?

For the major civil services it would be possible to extract (as from the decisions of the *Conseil d'État* and the general code of duties of German officials) a set of strict injunctions to civil servants that their behavior to the public be always irreproachably considerate and well-measured. Such injunctions are very urgent, since an aggrieved citizen is faced with a dilemma: either to suffer rough treatment without the possibility of turning to an alternative source of supply of the service, or to make a formal complaint and be obliged to go through a wearisome course of correspondence long after the first smart has passed away.

In every country the public is hostile to the official because at some time or other, as an inspector or a tax collector or a medical officer or what not, he comes to take away, not to give—it is in the nature of his task to limit one's freedom and property. This is not done for himself, though he may feel some satisfaction in doing it—he may feel powerful, stern, a *deus ex machina*, yet in the end the deed redounds to the benefit of certain individuals and groups in the background. One experiences the deprivation, but the social benefit is not so easily discernible, just because it is social and diffused rather than immediately personified. The public fears the official and the extension of official activities, because it feels there is no chance of appeal, no alternative to official judgment. It cannot understand, without careful tuition, why officials receive pay and pensions—why, indeed, they are needed at all. All other businesses explain themselves. In Germany advertisement is less necessary than in England, because the activity of officials has for over a century been an honored part of the general civilization to which all are accustomed. Even so, the German civil service associations do not maintain a sulky

silence, but keep themselves well in the public eye, both inside and outside Parliament. A few among the public everywhere recognize the significance and difficulties of the official's function; ought not steps to be taken through every medium of publicity to overcome the hostility and distrust? (Yet there is a valid difference between information and touting for support.)<sup>2</sup>

Supposing one were asked for a civil servant's vindication in regard to the public, what would it be? This, I think:

I possess great power, and I may do you harm. I do not, however, act for myself, but for the public good as determined by the legislature or the local authorities and often by direct representations from the public. Nor do I act arbitrarily, but according to rules which are equally valid for everybody. Not my will prevails, but the will of other members of the public. If, therefore, you quarrel with my powers, you should not blame their immediate executor but their ultimate creator. Yet, of course, some discretion is necessarily left to me, and I know that I ought to exercise this with all politeness, understanding, and the infliction of the least amount of necessary pain. Like all men—like you, for example,—I am sustained in my work by my pay and other rights, my zeal is not consistently at its highest level, and I have alternations of mood (sometimes I am alert, sometimes slack), yet I will not deny my services because they are troublesome to me and because they are just a little beyond the minimum which will forestall and avoid complaint, but positively seize opportunities to be helpful, fitting the remedy carefully to the case. Your own roughness, accent, and social standing may affect me, but I will try to avoid letting them improperly bias my reasoned judgment. Business would proceed more speedily and appropriately if you would cooperate with me by recognizing my difficult position and treating me with sympathy rather than hostility, if you read all the rules which you are supposed to read and keep, before you fly into a temper because mistakes have occurred, and if you willingly cooperated on the various committees which are and should be established for collaboration.

Even with all the arrangements and personal control which conduce to smooth working of the service and satisfaction of the pub-

<sup>2</sup> Cf. J. L. McCamy, *Governmental Publicity* (Chicago, 1939).

## THE PUBLIC AND THE SERVICES

lic, I may still suffer from unsympathetic treatment because ultimately I am the representative of the state—that is, the whole of the public! You will of course enjoy my power and applaud it when it does you some immediate good: I must beg you to recall the significance of my work when I have to weigh the rest of the public good against you. I at least am a member of a body which is neutral in the state, or rather helpful to all. You cannot buy more of my services if you happen to be well off, you will not get less if you happen to be badly off; you will not be passed over

if you belong to one particular party or given special privileges if you belong to another. We represent the unity and collective control of the state. I give the whole of my time to the work, and am as entitled to my pay and pension and other rights as any other worker. If my services are intangible or misunderstood they are nevertheless productive and important. Without them, your state will be nothing but a desert full of the discordant noises of people giving contradictory orders: It will crumble and cease to be a state—for a state is coordinated action.

## Concluding Observations

CAN one fail to acknowledge that the most amazing quality of the processes of democratic government described in the foregoing chapters is the amount of rational self-control exerted by human multitudes? (Or is it self-indulgence? Could they be worse if they tried?) In other contexts it may matter whether this self-control is itself a blind, impetuous instinct, or something open-eyed and superior to instinct. Here that question need offer no challenge. We stand astounded at the subtlety, complexity, the coordination, and the undefeated persistence of the deliberating mind, which works to make its multitude of values prevail in a social medium incalculably more convoluted than man's brain—seeing opportunities, alert to apertures, quick to retreat from a noose, ingenious to invent the paths of advance and escape, *homo faber*, the smith hammering, tempering, shaping, and fitting! Self-government is a miracle wrought by reason that wrestles with the Dionysiac and other volcanic rages of human nature; and it is no wonder that it is as yet an imperfect miracle.

Some political scientists take keen pleasure in observing the degree to which men are nonrational and nonconscious as they create and work their governments. Some especially delight, as did Faust in Goethe's drama, in playing with the question, "Which came first—the Word, or the Mind, or the Force, or the Deed?". For some indulgent moments they enjoy a bout of cynical inebriation with the idea

that institutions arose without kindness aforethought and unblessed with any measured choice and thought regarding values, ends, and ways and means. Without denying the insurgency of the irrational and the unconscious, let us acknowledge the tremendous philanthropic inventiveness of men in the art of government, for, at the very least, that is a spur for future inventiveness and a promise of reward for the agony of courageous thought.

### VINDICATION OF DEMOCRACY

THE principal, indeed, the desperate, task of democracy is to maintain itself; its next, to improve and refine itself. This question needs solution: what Marxism is to Soviet Communism, and what Racism was to the Nazi State, X is to Democracy; hence: What is X? X is the value that is most hospitable and least hostile to all the other values which burn in man sometimes at such intense heat that were it untamed, the commonwealth would melt away.

It can hardly have escaped notice that the present work has devotedly avowed the tenet that democracy is the "right" form of government for mankind. Democracy's needs have been used as the standard of valuation of the efficiency of the institutions and procedures of government; and imperfections of conviction, obscurities in values, and mismanagement in action have not been ignored. The cri-

## CONCLUDING OBSERVATIONS

terion itself needs justification: it is the *X* we seek: we have to find an answer to the question why democracy is "right."

Like Locke and Rousseau (with the qualifications set forth in Chapter 5 on *Democracy*), I believe that of all forms of government the world has so far experienced and of all those conceivable, democracy is "right," and that, as a major expediency within democracy's own values, the majority is "right." It remains to be asked what is the meaning of "right."

I quote the masters. Locke said: <sup>1</sup>

And thus that which begins and actually constitutes any political society is nothing but the consent of any number of freemen capable of a majority to unite and incorporate into such a society. And this is that, and that only, which did or could give beginning to any lawful government in the world.

Rousseau declared: <sup>2</sup>

It follows from what has gone before that the general will is always right and tends to the public advantage; but it does not follow that the deliberations of the people are always equally correct. Our will is always for our own good, but we do not always see what that is; the people is never corrupted, but it is often deceived, and on such occasions only does it seem to will what is bad.

All that Locke and Rousseau mean is that the principles on which autocracies, aristocracies, theocracies, monarchies had been founded in the past, and the values by which they had been defended, could not muster for themselves as much reasonable assent as democracy. If we look for the most lawful or righteous principle of government, that which will involve the least coercion and feeling of coercion, democracy is less open to discredit by rational argument than any other principle of collective living in the large areas in which multitudes now live.

Now, a deservedly famous liberal, Lord Acton, was ill at ease with these enthronements of democracy. He objected that "The Revolution taught the people to re-

gard their wishes and wants as the supreme criterion of right." <sup>3</sup> This is hardly a fair description of the doctrines of Rousseau or Siéyès. What they taught was that the people had the right to wish and want and create policy, not that there was never stupidity or brutishness in what they wished or wanted. It is clear that the word "right" is being used in two different senses, refers to two different orders of value. In Rousseau's sense, in Locke's and in my own, the "right" is concerned with the problem of who ought to exercise authority? But Acton confuses this with the question, who is most likely to be wise? A world of difference lies in the distinction, and some further probing of it may help to answer, what is *X*?

Acton believed that no one, whether the one or the few or the many, should rule with unlimited power. What then should rule the rulers? At various points in his writings, the reign of principle is expressed as "Reason," or a "higher law," or "the law of Heaven," or a "code not made by man," or "a law of nature," or "the voice of universal reason, through which God enlightens the consciences of men."

The issue is, through what medium is moral rectitude to enter the body of society? Acton may argue that God alone is right, or only Reason is right. But assuredly God is vapid without a vicar, and right is ethereal without an agent. This, then, is the crux: through whom is Reason to speak, carried by what means of communication will it be found?—and the question is, also, for whose satisfaction ought we wait, who is the proper judge?

Surely the values held by the multitude will decide the rectitude of any social principle, custom, law, or agency as it touches the happiness and sense of what is right of each and all. It is, of course, well understood that in any political situation where an opinion is called for, something more than the individual's values is involved: there is the body of facts which the mind receives into itself, the facts of

<sup>1</sup> John Locke, *Essay on Civil Government*, Chap. VIII, Para. 99.

<sup>2</sup> J. J. Rousseau, *The Social Contract* (1762), Book II, Chap. III; and on the "majority," Book IV, Chap. II.

history and of contemporary occurrence in the close and distant environment. Yet Francis Bacon's *Novum Organon* and his *Advancement of Learning* have amply warned us not to believe that those are our values that we first see without self-criticism, that we may be deceived by ourselves and the Idols of the Tribe, the Cave, the Market Place, and the Theater. What is tremendous in its significance for political science and political action is this, that even when the question on which judgment is required is analyzed into most minute parts and propositions, when they seem to have been taken back to questions of demonstrable historical, statistical, psychological fact alone, none except a very few physical facts are scraped entirely clean of value judgments or can be. The bone of social fact is never scraped clean of values; the bone itself, its shape, size, and matter, is itself compact of values. I say this, advisedly, after searching inquiries conducted in group work with the ablest of colleagues. And, it is important to say it, for it faces us with the challenge, how are the different, and potentially conflicting values, to be reconciled—assuming that one is interested in reconciliation? What is "right" will be the morally least challengeable method of reconciliation, the principle that divides us least—assuming that one is interested in minimizing the divisions among men.

Even supposing the political facts to be commonly accepted and demonstrable to the common satisfaction, men are still faced with the judgment: What do they mean for me? What rights against others do they confer on me? What duties, and to whom, do they imply? To whom ought I defer? To what services ought I devote my brief time, my only true capital, on earth? And when this last is said, it will be remembered that some men's values include immortality.

Even where the bare bones of fact are clearly presented—e.g., in United States housing policy—the fact that, as compared with other nations, the American steadily spends a much larger percentage of his income on his automobile, his picture theaters, and his cosmetics than on his hous-

ing it is still but a minute particle of all that a person needs to know in making of policy. If all the relevant facts were clean and dry, and agreed, he would still be baffled by their number, which run into thousands for his whole integrated domestic and international policy, and the significance of each when fitted with the rest would be not what the facts could cry out for themselves but the value which the policy maker imputed to them as he made a plan to act and conducted himself in the course of action.

All of man's personality all through time, his internal balance of personality, unique as it is and mutable in its own unique way in every second of his life, is involved in his valuation of any single decision in social life. Jacques Maritain rightly observes: <sup>4</sup>

I am known to other men. They know me as an object, not as subject. They are unaware of my subjectivity as such; unaware not merely of its inexhaustible depth, but also of the presence of the whole in each of its operations, that existential complexity of inner circumstances, data of nature, free choice, attractions, weaknesses, virtues perhaps, loves and pains; that atmosphere of imminent vitality which alone lends meaning to each of my acts.

The crucial question then is this: is this personality to be asked for its *acceptance* of social policy or to be coerced into obedience and seeming acceptance? Is government to fall back on physical fear? If voluntary acceptance is chosen, it is happiness, or at least it minimizes unhappiness, which some have accounted to be the proper end of morality and politics. And, even if man's happiness be not regarded as of any importance, and is discarded with contempt, as it was by Hegel and Carlyle as unworthy of man (and God!), even if Virtue is regarded as the superior end or value, it would still be cogently tenable that this end requires the voluntary assent of one's own standard of value. For to have another man's idea of virtue forced on one or to achieve triumphant rule by cheating is hardly virtuous, and to be obsequious to his decrees

<sup>4</sup> *Existence and the Existent* (New York, 1948), p. 76.

## CONCLUDING OBSERVATIONS

for fear of punishment puts one's virtue out of action as much as if it were annihilated.

Yet, it ought to be asked, is there no value, no virtue, no reason, possessed by some one man or men so demonstrably, so convincingly, that all men ought to accept them, can receive them, and be happy? The answer is a reluctant but firm and dispassionate No! Neither revelation nor scientific proof nor the examination of man's mind and will in the course of history points unchallengeably to any man or a few who have possessed, possess, or may possess, the truth infallibly for all time, for all circumstances, and for the satisfaction of all of us. That declaration is the cold and pallid faith that defines by inference the "right" of democracy. For it defines our duty to live in and for a polity which secures and guarantees to others (who would therefore guarantee to us) the social and governmental arrangements which will constitute the maximum resistance to force and oppression, give the maximum latitude for spontaneity of ideal and action to all, that is, which will keep the way open for diverse values and loyalties and yield the least ground for the sacrifice of one person by another.

Many will hate such a faith—as I shall show that Nietzsche did—because it entails the acknowledgment that their own brand of perfection has no valid claim of itself to rule the rest of the world. Acton would have to yield and subordinate *his* idea of wisdom or reason (at least to some extent) to this overriding faith and its discipline. But this principle has its merits even for an Acton. For the chief social consequence of the tenet that a single unifying indisputable ideal cannot be discovered either in revelation or scientific test is the principle of supporting everybody everywhere in the maintenance of those institutions which provide men with the freedom and latitude to fit themselves, their qualities and desires, where they most happily can, with the maximum permissions and allowances of the right to dwell elsewhere in thought, opinion, occupation, and place, with abundant grounds of appeal, and the chance of

mercy and redemption over and above the assurance of justice. Such a polity is the frame of a universal freedom, defensible by each for all because the defense of freedom for all is the maintenance of freedom for each. Inside this philanthropic frame of freedom, and not transgressing or overthrowing it, all faiths and minds and values should find their initiative and momentum, and though there must be limits, their avenues of development, and a not too oppressive haven from rivals and enemies.

This is, perhaps, the principle which will find the maximum, though not universal, acceptance in the long run. It is therefore also justifiable for short-run situations when patience and tolerance may be on the point of collapse in face of some bitter complexities in social change. Forbearance can cogently be asked for in short-term troubles as a sacrifice to avoid threatening the long-term good.

This, then, is the answer to the desperate cosmic question mark. It needs to be briefly restated, and the consequences of its rejection suggested.

When it is said that democracy (and through its major expediency, the majority) is "right," it is asserted that all individual values deserve the right to be heard, and that when they have so been heard and manifested themselves to attract attention and commend themselves, it is right that the reconciliation shall be made by all voices equally heard. Values can be called "interests" or the "religions" of individuals or groups if it will make the matter clearer. The Nietzschean view would utterly discard this "right." Here is a characteristic passage:<sup>5</sup>

The essential thing, however, in a good and healthy aristocracy is that it should *not* regard itself as a function either of the kingship or the commonwealth, but as the *significance* and the highest justification thereof—that it should therefore accept with good conscience the sacrifice of a legion of individuals, who, *for its sake*, must be suppressed and reduced to imperfect men, to slaves and instruments. Its fundamental belief must be precisely that so-

<sup>5</sup> *Beyond Good and Evil* (New York, 1937), para. 258.

## VINDICATION OF DEMOCRACY

ciety is *not* allowed to exist for its own sake, but only as a foundation and scaffolding, by means of which a select class of beings may be able to elevate themselves to their higher duties, and in general to a higher *existence*. . .

The implications of the antidemocratic philosophy are plain: Nietzsche is saying that some men have the right to be so sure of their morals that they kill others for their victory. The implications are that there need be no attempts to persuade; that indeed, such attempts are undesirable, for they cannot possibly succeed since one man will not comprehend the merit of the other man's values; and that steady repression, with murder as the ultimate means if necessary, may be undertaken. It means that an antidemocratic society must undertake the permanent application of force. Such a society would have to face the continuous possibility of revolt following on conspiracies. It would contemplate with equanimity the unhappiness of the oppressed, and, of course, make their unhappiness certain. It denies to them from the beginning the possibility of virtue. It makes rancor and fear, of the rulers as well as of the ruled, the permanent psychological atmosphere of society. It denies peace, and therefore, time for reflection and experiment and, perhaps, reconciliation of values. It forfeits the possibility of evoking truth for it condemns diversity, the riches of individual uniqueness, and originality—it never allows the multitude sparks of originality to soar, to be added together, contemplated, and compared. It is as irresponsible as Hegel, when he said: \*

Great men have formed purposes to satisfy themselves, not others. Whatever prudent designs and counsels they might have learned from others, would be the more limited and inconsistent features in their career; for it was they who best understood affairs; from whom others learned, and approved, or at least acquiesced in—their policy. For that Spirit which had taken this fresh step in history is the inmost soul of all individuals; but in a state of unconsciousness which the great men in question aroused. Their fellows, therefore,

follow these soul-leaders; for they feel the irresistible power of their own inner Spirit thus embodied.

For Hegel did not leave it to the masses to decide whether they should follow or not; and he left the means to be judged not by them, but by history, which of course necessarily displaced the judgment to aeons away from the date of acts which he said constituted the "litany of lamentations" of whole peoples.

The "right" for democracy that we think we have established is, then, no denial of the right of all to initiative, to leadership; on the contrary, it vindicates it. In our inevitable divisions, the democratic is the polity that divides us least. In our inevitable fury, it moderates us most, compatibly with our continued creativeness. It is resilient and self-curative, not entirely without coercion, for that (alas!) is impossible, but deploying the minimum residue of coercion permitted after patient contention and reasoning enforced by the right of dissent and the right to have one's votes counted. It is the right to picture your view of the supreme good, as you see it, to all the public, even to operate that supreme good in a limited area and for a limited group of adherents (family, business, church, club)—and these, as it were, are inoculations for the whole of society. If a wound is made in the mind of the great community, the dissenters may rush to cure it; if a hole is torn in its body the believers in other values may gather together to fill it.

For many, like an Acton or a Nietzsche, the democratic "right" will not be the ideal best: for all, however, it may be the acceptable second-best: that is to say, that which permits their own best, their own Reason, their own *vox Dei*, a life and a chance of persuading others, which otherwise might be altogether denied to them. It is the arbitral principle which admits challenging argument, but it is the one which is open to the least damaging criticism when contrasted with those other principles of government which have for so long presided over the destinies of man. If there is a less vulnerable principle of

\* *Philosophy of History*, trans. by J. Sibree (New York, 1944), p. 30.

## CONCLUDING OBSERVATIONS

"right," I should like to hear it. Provided—of course, provided—that one wishes to eschew force and fraud, and that one wants the reign of peace, while justice is being cogitated and instituted as conscience freely develops in the most extensive feasible area containing the greatest number of people.

The democratic "right" as we have been obliged to justify it, is the equivalent of the "civil religion" which Rousseau demonstrated<sup>7</sup> must be set up over all other religions if a state, that is to say, an order embracing millions of people with divers and ever changing religions, are to live peaceably together in the possession of their faith.

There is therefore a purely civil profession of faith of which the Sovereign should fix the articles, not exactly as religious dogmas, but as social sentiments without which a man cannot be a good citizen or a faithful subject.

### THE RECONCILIATION OF VALUES?

It would be a mistake to seek to brush away the real problem of the reconciliation of values by the belief that differences are differences in words, mere semantic confusions, and that if only the right formula in words can be found we need not be concerned for a principle of reconciliation or at least of peace. For this would be only to adopt Mephistopheles' mockery, expressed in Goethe's *Faust*, as our valid comfort.

Do not try tortured ideas to find,  
Because when to concepts you are blind,  
A word as substitute arrives.  
With words fine arguments can be conducted,  
With words whole systems may be constructed,  
With words we can continue full believing,  
From words not a jot is open to the thieving.

We do not seek to minimize the strength of clashing convictions. One of the most impressive lessons the political scientist learns is that the splendid minds to which nature has given birth do not often and never altogether agree with each other. Take any ten political philosophers in the two thousand years since Plato and Aris-

totle, and unique outlooks will be discovered among them all, and therefore unique interpretations and practical policies. Points of agreement there are: but the world-shaking fact is difference. It is possible to sweep away the differences due to diversity of interests, misunderstandings about words, dissimilar environments, the peculiarities of the age in which they lived. Yet when all this has been allowed for, and when mere factiousness and envy have been purged, a solid difference still remains. No amount of argument and experimental persuasion can budge them from their special vision. I do myself damage if I do not try to fathom to the end the ultimate assumption which is their integrity and incapable of being surrendered; I remain incomplete if I ignore the added consciousness it gives me; and being incomplete my duty will be less perfect and my services less valuable than they might be. A gulf must still be bridged. The principle that democracy is always "right" is the only one that can bridge it: though there have been and are forms of government which abridge not merely the gulf but the terrains of diverse personality which abut upon the gulf—which "make a wilderness, and call it peace!"

Edmund Burke has even warned us of the need to consult more than mere reason—or he might rather have said, reasoning—when we attempt to apply our knowledge of humanity to the conduct of government; that is to say, our differences are not only more than differences of words, but graver than differences of reasoning. He said:<sup>8</sup>

Politics ought to be adjusted, not to human reasonings, but to human nature; of which the reason is but a part, and by no means the greatest part.

This dictum did no more than revert to what Locke had called the "ocean of being" of man, but it did no less than foresee the mighty divers into black depths of the human psyche, Schopenhauer, Nietzsche, Freud, and Freud's continuators and critics. This is not the place to

<sup>8</sup> On a Pamphlet Intituled *The State of the Nation*, 1765.

<sup>7</sup> *Contrat Social*, final Chapter.

accompany those explorers; but it is the place to say that an inkling of the fervencies which separate men was enough to persuade men like Burke to warn us not to look too deeply into the origins and cohesive bonds of society, and Burke is obsessed by their inscrutability. Yet it is not their inscrutability so much as the enmity that might be ignited by their clear-eyed scrutiny and a penetration to the passions beyond the thin confines of reasoning. This is not to say that men are not in much united—witness the area and the long periods of peaceful living, peaceful reform, and peaceful progress within each state. Much unites them; but much more might divide them if their polity was such as to involve a perpetual agitation of their differences. It is Nietzsche who prescribes free, forceful, unscrupulous adventures of the will, and it is equally Nietzsche who recoils with horror from the sight of the will at work:<sup>9</sup>

Alas for this mad melancholy beast man! What phantasies invade it, and what paroxysms of perversity, hysterical senselessness, and *mental bestiality* break out immediately, at the very slightest check on its being the beast of action! All this is excessively interesting, but at the same time tainted with a black, gloomy, enervating melancholy, so that a forcible veto must be invoked against looking too long into these abysses.

What is the political scientist to reply to the passionate, ferocious claims of the human nature which is deeper and fiercer than what may be too easily dismissed as but superficial Jeffersonian reasoning? If millions upon millions are to live in wide areas rocked in peace, with violence outlawed—if this value commends itself—then we are compelled, I think, to found our government upon a tactical ignoring of the furious claims of any one or few above any others, and to admit only a common right to expression and persuasion short of war and the immediate and present threat of force. But this is the democratic way. It demands some self-abnegation, even the self-control of press-

ing the democratic principle, especially the majority principle, to the point of absolute perfection. The older phrase for it is "ballots rather than bullets": a newer one may be supplied, but potential critics of morals and English are begged to forbear—"kid or kill"!

IN WHAT SENSE GOVERNMENT IS ONLY  
"SECOND BEST"

A BIOGRAPHER of Lord Morley, dilating upon that statesman's practical wisdom, used a phrase which not so long since was a cliché among political scientists, particularly those who in an exhibition of man-of-the-worldishness let us into the secret that the self-government of man is a difficult enterprise: "politics are one long second best."<sup>10</sup> Some consideration of the commonplace is relevant to an understanding of the justification of democracy.

Every one of us, escaping from the trance of habit, from time to time wins an idea of the "best" objects, methods, and procedures of government, or, perhaps more narrowly, some governmental device, a swift stratagem, for solving a troublesome problem, and with ingenuity we offer to square the political circle. This would be for the "best" of all concerned, "best" in objective and "best" in means.

Yet, on second thoughts, it is borne in upon us that someone must pay for the reform we have proposed. It may be that the cost makes its pursuance unprofitable. It may be also or alternately that success would require qualities human beings do not possess, and of these some may be of a kind that can never be possessed by any man, or are possessed by very few, or can be acquired but only at immense cost, or are attainable at the combined prices of effort and time. Sacrifice, resignation, abnegation, and time, are especially necessary ingredients where the "best" is founded upon the development, reconciliation, and the common acceptance of values.

Counting the cost, it is at this time that

<sup>9</sup> *Genealogy of Morals* (Modern Library, New York, 1937), p. 88.

<sup>10</sup> J. H. Morgan, *John, Viscount Morley* (London, 1924), p. 111; and see above, p. 7.

## CONCLUDING OBSERVATIONS

we recognize that we had better do the best, that is, now the "second-best," with the means and the time available to us. The intellect might do better, the heart might counsel braver new worlds, but the material is not yet to hand. Yet we may do better than we are doing by using the available material more aptly: our brains may advise us of a better situation than the one we accept—but not to the wished-for "best." *Quære*: Is the unattainable "best" to be called "the best"? Or is the attainable best, given the material and the time at our disposal to be called the "best"? If it is the latter, it can no longer be apologized for as "the second best." Immanuel Kant somewhere names this so-called second best "the best compossible," that is, the best consistent with the circumstances. It is, of course, realized that from the standpoint of any idealist deeply attached to his ideals, and not prepared to concede the justification of democracy, which requires of him that he carry us by persuasion or not at all toward the fulfillment of his ideals, and which gives equal hearing and play to other and perhaps inimical ideals, what is achievable can only be the second best indeed. The temper of such a demand for the sectarian best may be appreciated from a letter of Lord Acton to Gladstone's daughter:<sup>11</sup>

But if party is sacred to me as a body of doctrine, it is not, as an association of man bound together, not by common convictions but by mutual obligations and engagements. In the life of every great man there is a point where fidelity to ideas, which are the justifying cause of party, diverges from fidelity to arrangements and understandings, which are its machinery. And one expects a great man to sacrifice his friends—at least his friendship—to the higher cause.

And it is no surprise, excepting in its candor, that earlier in the letter he confesses:

Politics come nearer religion with me, a party is more like a church, error more like heresy, prejudice more like sin, that I find it to be with better men.

<sup>11</sup> Lord Acton, *Letters to Mary Gladstone* (London, 1905), pp. 314-15.

The burden, as Lord Morley saw it, that made the second best tolerable *in lieu* of the best as Lord Acton wished it, is expressed in his understanding of the heavy operation of the machinery that we have quoted earlier.<sup>12</sup>

### WHAT IS LOST AND GAINED BY WHOLESALE GOVERNMENT

It is fortunate that we take for granted the unearned bequest that modern states are so large in area and population and the assumption that they should be so. But it is important to be deliberately aware of the consequences of size—of units of government which embrace as many as 150,000,000 in the United States, some 40,000,000 in France, nearly 70,000,000 in Germany, nearly 200,000,000 in the Soviet Union, and approaching 50,000,000 in Britain. Immense advantages to human existence, and not a few awkward ills, arise from what is a simple but stupendous fact, and we are not nearly conscious enough of this balance.

The primary advantage (and this does not exclude our understanding of the derivation and parallel advantages), is that over a large area, solicitous for the life of millions upon millions, peace reigns, violence and war are banned, and there rules the presumption of tranquil, uninvaded communication and exchange—that is, of Order. Connected with this, and in part its condition, is the highly probable assurance that if the present situation of interpersonal and intergroup value-adjustment is deemed unfair, a remedy may in the future be available by persuasion. Time and peace are needed for the appeasement of temper and the clarity of vision which *may* probably bring what is regarded by more as a higher justice. Time and peace may, in fact, not bring justice—but without time and peace, justice will far less certainly be won. Fears are relieved, hope is encouraged.

How priceless is this boon, for most people in the long run (not for all. for

<sup>12</sup> Cf. page 7.

some may hate the consequences), may be inferred from even a cursory recollection of the many centuries of war, and the struggles and hopes of mankind for peace, for world government, for a federation even, and in the last resort, merely for pacts of friendship and defense. What were the friends of the League of Nations and the United Nations not prepared (in theory, at any rate) to sacrifice in the subordinate inefficiencies of government in order to secure the benefits of peace?

Yet the wholesale nature of government gives birth to two evils which must never fail to be counted against its enormous profit. The first is the burden of centralization, which has a twofold nature: it involves the expense of officials and organization, and it cannot provide for direct, highly considerate individual treatment of the needs of all its individuals and groups. To these evils there are remedies and mitigations: but they require to be devised and applied. The second is the limitation on the liberty of subordinate groups within the larger community, when they are prohibited from exceeding persuasion and minor intimidations in pursuit of their ardent will and best beliefs. The cost to such subordinated groups (when they are subordinated, and they will not be subordinated for all time and in everything that concerns the commonwealth—they too will have their day), is best expressed by Hamlet:

For who would bear the whips and scorns of time,

The oppressor's wrong, the proud man's contumely,

The pangs of despised love, the law's delay,

The insolence of office, and the spurns

That patient merit of the unworthy takes . . . ?

but it would not follow that the bare bodkin would be used to make the quietus of the oppressed: it might kill the commonwealth, by rebellion or revolution. Yet the democratic life urges them to be tolerant, patient, to bear misunderstanding, to suffer fools gladly, to risk futility. The French political philosopher, François Fourier, in his *Théorie des Quatre Mouvements* (1808), thought he might re-

duce the inevitable pressure of the great society on the individual by disintegrating France into many hundreds of self-governing societies, called phalansteries, each containing 1600 persons. In these small units it would be possible for the members to know and participate in the affairs of the whole without a cumbrous apparatus of government. But, clearly, he does not allow for either differences of values within the phalansteries, or differences among them. The idea is mentioned merely to underline how deeply some may resent the vexations of the wholesale community, and to suggest that smaller communities are not without their problems either. The organizational pressures of the wholesale area may be met by ingenious decentralization, and by such an education of the citizen as to teach him the access to office holders and the centers of authority. The wholesale state itself may be made more tolerable by obedience to the principle that no additional function is assumed by the state—or rather, is imposed upon it by the majority—unless it promises fulfillment of a social value intensely held by a substantial majority. It must be remembered that one of the advantages of collective action is the maintenance of union and peace over a large area of the earth: when we condone anew state activity, we win a general benefit over and above the specific one, so long as the place of freedom is guaranteed.

## DEMOCRACY AND ECONOMIC WELFARE

Some critics of democracy and some of its good-hearted, but confused, friends express fears that democracy may be too weak a form of government to overcome the very awkward economic and social obstructions in the track of the nation—obstructions which, however, must be overcome because it is democracy's principal business to furnish high economic welfare for all.

Now, it is true that under democracy the raising of the standard of living will be forwarded exceptionally well. This is for two reasons. First, freedom of enter-

## CONCLUDING OBSERVATIONS

prise together with government regulation and activity will be developed in the measure in which the *whole* community—all its various interests and skills—demand it, with a considerable degree of willingness rather than coerced planning, and the poorer part of the community will be assisted to opportunity, education, and health in many ways by the social services and social-security arrangements. Secondly, it is also true that some political parties, perhaps all, will insistently preach the value of ever-higher standards of living.

Yet there are dangers to democracy in the insistence on inordinate economic welfare. It would be tragic to neglect the fact that democracy's keenest rival for man's devotion is economic welfare. The conflict between them is not absolute but is a matter of degree. Even in saying this, it is necessary to be alert to the dangers of the rivalry. For it would be wrong to promise rapid, almost immediate, increases of wealth in such quantity that the inventiveness, the resources, the skill of labor and management, could not possibly provide. Much popularity can be easily won by whipping up the expectations of the needy and encouraging indulgence in acquisitiveness. There is no more heart-warming experience on any political platform. Indeed, the appeal has its definite value: it makes people discontented with their lot when that lot is remediable, and it may even inspire men and women to rise out of their laziness and ignorance to engage in ingenious invention and aggressive enterprise. But unless those who speak in these terms be ruled by sincerity and sobriety, they play with fire, with arson for democracy. It is too easy to exploit poverty and misery, and arouse an acquisitiveness which, given lack of time and ability, is not satisfiable. Civilizations are full of proverbs and parables regarding the seductions of wealth: God and Mammon; the Golden Calf; "Man does not live by Bread alone;" betrayal for thirty pieces of silver; "for a handful of silver he left us"; and so on.

It is also true that for the easy, tolerant, and cheerful conduct of democracy

without violence, a degree of economic abundance properly spread is necessary. It is not unfair thinking to relate the rise of civil liberties and democratic constitutions to the growth of wealth in Europe and the United States—though great care must be taken not to ignore other factors. It was Francis Bacon who advised the spread of wealth as a preventive of seditions. Yet to be sure of democracy, democrats must be temperate about acquisitiveness. Democracy is its own reward: it is not merely a means to an end: it is an end, and the most important end. To say otherwise is to fall into a materialism which could lead to a government of chains, even if self-imposed chains. Democracy in a reasonable time will lead to the maximum welfare; but the maximum welfare worshipped as a prior or competing standard might, if beyond any reasonable estimate of feasibility, kill democracy by incitement to unreasonable and violent discontent. What a democracy acquires it itself guarantees that its members may keep; what a revolution and a dictator, in the name of wealth first, donate may always be taken away by its givers, even if what is given is actually something more than an unfulfillable promise.

### DEMOCRACY AND HAPPINESS

Democracy in modern gigantic states is a wholesale arrangement. As such it cannot possibly penetrate to the relief of some forms of unhappiness experienced by individuals and families. By hypothesis these would be different from the usual. Nor, given the kinds of happiness which alone may please people of special tastes and bents and family upbringing or fortune, is it easy to know what would make them happy, even if it were possible to transform the whole of society for the sake of the less numerous portion of the nation. A well-educated, well-administered democracy, with a long-nurtured, mature conscience, may render great services through the laws and its career servants in these ways. But in many areas

the state cannot enter—we reach the non-political.

How small of all that human hearts endure,  
That part which laws or kings can cause or cure!

Still to ourselves in every place consigned,  
Our own felicity we make or find.

These areas are the preserve of social action on a local scale, of fellowship, voluntary, personal, or in small groups: of free friendships, clubs, associations, societies, forums, the private practice of brotherhood. The state may assist with money or advice; by the loan of experts; by arbitration at request; by the setting of standards when abuses have made themselves evident—for example in the practice of psychiatry or the adoption of children. Above all, the government will assist by leaving the circle of freedom to private persons where it itself cannot positively help them and where they cannot injure others. Where democracy cannot creatively bring happiness, it is the aptest form of government to say that what would seem to make for unhappiness shall not be instituted.

#### OF THE INFLUENCE OF TIME ON GOVERNMENT

It is impossible to discuss the nature of government without repeated use of the words "patience," "tolerance," "waiting upon persuasion," "deliberation," "education," and others which are synonyms or nearly so. These words are all variations on the word Time, and the idea to be conveyed is that with Time every difficulty in interpersonal relations may perhaps be peacefully resolved, and to express the conviction that without the lapse of Time between the conception of an idea and its application in practice, errors and violence will be committed. Not enough attention has been given in political science to the effect of Time on the political process, though much, of course, is casually assumed. Economists habitually make a distinction between the short run and the long run, not that they follow out the consequences fully,

or that they can or should be required to distinguish quantitatively between the one and the other in general. Far too little concern altogether has been shown by political scientists, and so a few observations are necessary, for an important connection subsists between considerations of time and the theory of democracy.

The problem of Time in political science may be considered from four points of view: Time and Patience; Time and Knowledge; Time and Appeasement of Passions; and Time and—for want of a better word—Eternity.

*Time and Patience.* If a government craves short-run, swift results, for whatever reason—and time and temper are in this respect one and the same thing—certain consequences follow. It enters on its task with forceful drive, and presses men and means to secure obedience. By hypothesis it is condemned and condemns others to inaccuracy of diagnosis and formula. Its rough, driving energy and faulty prescriptions fail to give it complete satisfaction in time, and compel its subjects to undertake passive or active resistance or simply to be irresponsible to orders or persuasion because they are surprised and lack mental and spiritual preparation. Since time presses, the intractability of the citizen is met with the government's hatred, proceeding from frustration, and violence is thrown in to redeem what would otherwise be wasted effort and disappointment. A vicious crescendo of mutual torment gains momentum. Reciprocal understanding is diminished, and the wish to understand wanes with the increase of spite. The end being rabidly wanted, the means are degraded. This is to look at the subject from the point of view of the government.

From the point of view of impatient citizens and their groups—and it must be remembered that there is close correspondence between citizens and governments in democratic states—the prospect of the swift passage of time, the vanishing and wasted years, the duties undone, the hopes unfulfilled, must stir to frustration and 'an the flames of a de-

## CONCLUDING OBSERVATIONS

termination to revolt, to claim the rights of minority rule, to attest the right of violence, and to be unscrupulous about ways and means, that is, about government.

What misery would the world not have been spared if the Nazi and the Soviet régimes had not moved under the compulsion of short-term results? There is even a Soviet saying that its present generation is "the manure of the future." The consequences of not waiting on Time rippled out from these régimes over the whole world, partly as the result of the obstinacies of the domestic situation and the psychoses they produced, and partly as a campaign against the rest of the world to make sure that the neutral and the hostile should be converted or sterilized at the earliest moment. These men could not be sure of the future as they thought it ought to be: they looked on their lives as inevitably brief and wished to see results in their own time, sufficient at least to give them the guarantees of the future after their own death. Their purpose was to pin down, to hold down, the effect of future time on a generation or more while habit formed, the habit that would then be so iron-bound as not to yield to the inspiration of those yet to be born. Opponents must be murdered; dissenting minds must be obliterated. The rulers fretted against the ancient wisdom:

Some men with swords may reap the field  
And plant fresh laurels where they kill;  
But their strong nerves at last must yield;  
They tame but one another still:  
Early or late  
They stoop to fate. . .

On a very dramatic level, the effect of the pressure of time on government may be seen in the ebb and flow of conflicting attitudes since the 1820's about the status and the civil rights of the Negro in the Southern states of the United States. To some the conflict of 1861 was "irrepressible," to others "repressible" and curative by time and peaceful change. Lord Acton showed no temporal zeal for emancipation: he saw the world *quod semper*

—everlasting. On a lesser scale, it is interesting to reflect that the robust methods used by the Tennessee Valley Authority in its struggles with the public utilities of the region sprung in part from the belief that the then directors could depend only on a single four-year term for President Roosevelt, and therefore the electricity corporations must be conquered in that brief period, or perhaps never.

*Time and Knowledge.* No one is born wise, though he may be born with the propensity to wisdom within him. Time alone teaches us the lessons of man's nature, in our own experience which carries conviction and validity far above what comes from reading and oral teaching. Not that the latter does not require time also. But experience itself affects all the senses, while the written word and the most vivid teaching rarely sets in motion all our nature. It takes time for any facts to be fitted into the world as it has come to be built in our minds. The truth is the coherence of all that we know and all that we can know. The full truth could not be known by any of us until all the experience of the whole of life has been counted, for failing this, our world of one day may be inconsistent with that which is attainable on a later day. Bernard Shaw somewhere remarks that we experience a sense of loss when we have learned a new fact. He does not explain this feeling that something has been lost. The explanation is that we have lost a world we labored to create; but now a new process of creation must be undertaken because, to allow for hospitality to the new fact, to provide it with a room, the whole of that world in all its parts must be remodeled. The facts must be *dwelt with* if their meaning is to flourish, and if they are to be valued for their relevance for the springs of action. Time is technical knowledge, knowledge of human nature, of the mind of man as revealed in a very long historic experience, the knowledge of the systems of ethics and their fate, the strengths and impossibilities of administration, understanding of the processes of valid thought, and, far from least, self-knowledge. Time enables

us if not to conduct an experiment with life in our own time, at least to be present and observe.

The testimony to the truth of these observations has been given over the centuries by the wisest among mankind—it is in the poets as it is in the political philosophers, this “inseparable propriety of time,” which as Francis Bacon showed in *The Advancement of Learning*, “is even more and more to disclose truth.” Nothing wiser has been said on this theme than the passages in Burke: and it is a grave mistake for this reason, to charge him, as some have done, with being a “conservative” or a “pessimist.” Only a shallow mind, irresponsible to the point of frivolity, can believe that a just and true policy may be prosecuted without an understanding of the vastest and most intricate thing the world has to show—human nature in its environment where it calls for a political act. The assumption, of course, is that we should act on knowledge and not merely on zeal, however merciful and noble that may be. It is better that Burke speak for himself, in only one of his appealing intimations:<sup>14</sup>

It is one of the excellencies of a method in which time is amongst the assistants, that its operation is slow, and in some cases almost imperceptible. If circumspection and caution are a part of wisdom, when we work only upon inanimate matter, surely they become a part of duty too, when the subject of our demolition and construction is not brick and timber, but sentient beings. . . . Time is required to produce that union of minds which alone can produce all the good we aim at. Our patience will achieve more than our force. . . . I have never yet seen any plan which has not been mended by the observations of those who were much inferior in understanding to the person who took the lead in the business. By a slow but well-sustained progress, the effect of each step is watched; the good or ill-success of the first gives light to us in the second; and so, from light to light, we are conducted with safety through the whole series. We see that the parts of the system do not clash. The evil latent in the most promising contrivances are provided for as they arise. One advantage is as little as possible sacrificed to another. We

compensate, we reconcile, we balance. We are enabled to unite into a consistent whole the various anomalies and contending principles that are found in the minds and the affairs of men. . . . If justice requires this, the work itself requires the aid of more minds than one age can furnish.

It is suggested that if the good of all men and women should be sought by government, then the knowledge which fits the condition of all of them and their children's children is discoverable more faithfully in the form of the state which best provides continuity and duration and is avowedly founded on patience, and the principle of equality which best encourages men to speak out, and rebuffs the arrogant official's claim to know and act without consultation. If revelation requires encouragement and coaxing, and time to win all confidences, then democracy is an essential condition of the revelation of truth. The truth in political science is not submissible to the method of the natural sciences (who, indeed, would be happy if it were): what the rigor of cause-and-effect demonstration is to the physical sciences, time is to the social and above all to political science. The penetrative, permeating effect of time on truth may best be seen perhaps in Marcel Proust's masterpiece, *Remembrance of Things Past*. The world will be happier with a Proust as its political scientist than a Karl Marx.

*Time and Appeasement.* It is possible that time is more than revealing—that it is appeasing. I cannot be dogmatic. Philosophers and poets believe so. Shakespeare, for example, says, in *Troilus and Cressida*, “Time's glory is to calm contending kings.” What truth is there in this? Perhaps we could accept the view in the following process of argument. If we think of Time as being the property of the lives of the single citizens, then the young must grow older or, as we say, mature; while the already old will grow older still. It seems to be almost universally testified that the advancement to and beyond maturity is accompanied by an assuagement of passion, a moderation of temper, a cooling of emotion, a realiza-

<sup>14</sup> *Reflections on the French Revolution* (World's Classics) Vol. IV, p. 187.

## CONCLUDING OBSERVATIONS

tion of the extravagances of former hopes. A more modest sense of the importance and priority of wants is developed; the exacting demands on other people and on one's self are in later years acknowledged to be an excess of vanity. The progress is from Shakespeare's lover, "sighing like a furnace," to the soldier "jealous in honor, sudden and quick in quarrel, Seeking the bubble reputation, Even in the cannon's mouth," to the justice, "full of wise saws and modern instances." Where all may speak and act, as legitimate contributors to policy and government of the whole community, then the youthful dynamic is tempered with the reconciliations to existence of the middle-aged and the old, while the temperance of the latter is animated by the young of the living generation. I need not quote Burke again, for the famous passage in his *Reflections on the French Revolution*, extolling "the great, mysterious incorporation of the human race . . . never old, or middle aged, or young" is too well-known.

It is reasonably tenable that the polity that stipulates Time allows for appeasement: the democratic is a long-term régime. The democratic system and principle is liberated from the short-term frantic compulsions of one or a few persons obsessed, it may be, by the brevity of their own lives, and, by hypothesis, revolutionary as compared with the mass of other people, since their creed differs from that of the masses at the beginning and is obliged to remain eccentric for the sake of their credit and vanity.

*Time and Eternity.* To some, the Time of their own life is not the decisive, instigating factor of their actions within the span of their own life. They would hold that there is no value in seeking to alter the terrestrial future, and to attempt to do so involves a violence that debases the soul now. I cannot express this very well because either by nurture or by nature I have no clear comprehension or inward sympathy with this idea of reality. In default of my own evidence I adduce that of Aldous Huxley: <sup>15</sup>

For those whose philosophy does not compel them to take time with excessive seriousness, the ultimate good is to be sought neither in the revolutionary's progressive social apocalypse, nor in the reactionary's revived and perpetuated past, but in an eternal divine *now* which those who sufficiently desire this good can realize as a fact of immediate experience. . . The peace that passes all understanding is the fruit of liberation into eternity; but in its ordinary everyday form peace is also the root of liberation. For where there are violent passions and compelling distractions, this ultimate good can never be realized. . .

Whether such resignation does or does not involve the idea of personal immortality, it looks on mundane life (as Ecclesiastes does) as a brief instant, and its corollary is quietism. It is one strand in the Christian life, and as such has an important meaning for democracy, suggesting patience, toleration, and resignation and faith. Hence the Marxist regards it as "the opium of the people." Yet other parts of the Christian doctrine would spur to action. The political attitude appropriate to the sense of the insignificance of mundane future time for the political process would be long-suffering, charity, the abhorrence of violence, the counsel that affairs can wait, and if they do not, at any rate, in the end it will not matter even if an activist policy has created works, for they will crumble.

Even if this attitude is not held by even a small group of people in each nation in an absolute form, then it is still an ingredient in the values and habits of large numbers of people in a degree that varies from person to person—but all have traces of it, and the total is important for government.

The upshot of these considerations on Time is to commend the method of democracy in comparison with any other, except the *accidental* consonance of a necessarily short-lived dictator or small oligarchy with the values of the people they govern. Democracy is patient, reveals knowledge, appeases tempers and hatreds, and, proceeding on the principle that no legislature can bind its successor, makes no such fetish of Time as would prompt to major violence within the na-

<sup>15</sup> *The Perennial Philosophy* (New York, 1945), p. 194.

tion—that is to say, in comparison with other régimes.

## THE DEMOCRATIC AND THE DICTATORIAL STATE

THE threads may now be drawn together. The dictatorial state promises and can deliver swift action of a radical nature. But experience shows that those we have learned to know in our own lifetime—the nazi, the fascist and the Soviet state, still fumble in the effort for full administrative success for lack of time, knowledge, and happy cooperation by the millions to whom they have promised to do good. The rights of freedom of speech, of the press, of association, of meeting, of dissent, of participation in the will-building of government, are destroyed, and where they are given any license at all it is to the accompaniment of chicanery and corrupt practices by which the substance is withdrawn. The fury of fanatical zeal, the frenzied disappointment with plans unfulfilled, the nagging fear of doubt and opposition in the unfathomable depths of the population, spurs them forward to an aggressor's descent upon the people, with a gigantic police force, an army of torturers calling for confessions and betrayals, with force to the utmost, imprisonment, transportation, slavery, and murder, as the instrument of peremptory success. And in this dispensation the citizen is severed from his fellows by the fear of betrayal; cannot pour out his heart even to the officials who are supposed to be his benefactors; is direly constrained to appear to share the values thrust upon him. Under duress the gifted must hide their talents; the average must obey in fear, in rancour, and in hatred. The way of life is closed tight against the literature, the science, the religion, and the philosophy of the rest of the world.

The miserable, fearful, subjects of a dictatorship are cast out from the highest moral choices, those which concern the way of life of all mankind; for their dignity is openly despised. Above all, for the sense of the sensitive that the years pass by under perennial frustration, no remedy

is permitted which allows of peaceful change: they are entrapped in the bitter margin between fawning self-debasement and the hazards and blind extremity of revolution, revolution not even for the major purpose of changing the nature of the state but merely to change the personnel of an administration. Yes: perhaps for a time their material welfare is better than it was before; and perhaps there is a promise of better things for the future: but now and for any foreseeable and attainable time, there reigns the *angst* of a human mind and conscience writhing in the strait-jacket of alien values. The medicinal principle which a dictatorship like all other political systems contains is not the one which can be used as a daily diet, or, being used, can promise health: for it is either internal disruption of the dictatorial group or its overthrow in wholesale and protracted murder. Its medicine is brutality, even if heroic brutality, and brutality is a poison.

Democracy has its defects: the overcoming of hereditary privileges and the winning of equality takes time and strains the patience while the pain and stress of injustice continue to prevail. Collective action that promises vast benefits is retarded by special interests that hold strategic controls. Special ability and insights may be subordinated to the grosser claims of the mass of average men.

However, the political, social and economic gifts of democracy endow mankind with vast riches. We are so accustomed to the exercise of our civil rights that we have ceased to realize that they are as vital to our moral life as breathing is to our physical, and we take this miracle for granted! We can speak our minds, and so exercise our talents, relieve our protests, feel our dignity and community with our fellow men. We may soar on the wings of the evidence of all science, all art, all religion, all philosophy, from wherever and from whatever time they issue. We may in association with our like-minded fellow citizens freely join our efforts and fortunes to bring home to all the moral significance of our spiritual values and urge them to support our in-

## CONCLUDING OBSERVATIONS

terests and defend with us the liberty that is threatened. We have the assurance that the sphere of our private life—our family, our diversions, our worship, our work—will not be invaded except by due process of law in which we have an equal say with any. We rest tranquil that officials and judges will not abuse us, and that they themselves will have to answer for discrimination and bias and unauthorized invasions of our private or public life to a public tribunal in which we, as of right, sit as judge and jury. These values, too often taken for granted, are so immense to humanity that it is advisedly impossible to express their magnitude: no terror, no cruelty, no stifling, no roughness, no cunning or chicanery, no strong-armed hypocrisy. It is all imperfect, of course; but compared with nondemocratic government of past times and the dictatorships of our own time it wears the halo of perfection. We know, too, that inequalities can be reduced as soon as a majority are convinced that they are really inequalities and have no contemporary usefulness as a social function. Since the law will be made and the administration be given momentum and controlled by us, the voters, and since our power can be successfully exerted by association and persuasion, the impulse of the system is to foster fellowship and a common conscience among all men. The medicine of democracy is secreted in its own beneficent nature: the retreat from a political mistake even as the way forward is an open one; it is majority persuasion taking its original impulse and life from any one, the humblest indeed, who may need to raise his voice; and it is a remedy that practically does not call for bloodshed. Its principle, broadly and steadily honored in the observance, is, Let live, and live! It accomplishes the dual feat, first, of fanning the enthusiasms of all who have values and yet keeping the flames down below the height where they might set the whole community in an all-consuming blaze; and, second, of bowing to the inevitability of gradualness while not succumbing to political sloth.

The contrast between modern nonresponsible or dictatorial government and

responsible and democratic government is now more clearly seen. The former rests upon the pretension that a monopolistic and imposed party possesses the ultimate truth about the political destiny of humanity. That conviction is definite, sharp, and fanatical, and therefore brooks no opposition. But democracies admit the pragmatic nature of their search for perfection, and recognize that of perfection there is no single exclusive principle. Yet they surmise that if such there should be, it is one yet to be discovered in a process of evolution, and that if the unfolding is to arrive at soundness, it must be founded on the unfettered expression and interplay of all opinion.

Where then shall we look for the binding together of the world-wide network of mind and mind, to the end that the principles of democratic unity shall be applied and defended? The labors are, of course, divided among the exceptionally gifted and the universal body of men and women everywhere. The latter depend for the earliest intimations of vision and feeling upon the gifted, but must always have the last word, should they still want it, after having first heard and considered. And one of the unending tasks is to protect the open way for the gifted—for all the gifted of whatever persuasion—and equally to maintain the proper conditions by which the multitude's reflection upon them is promoted. Those with exceptional gifts are not divinely appointed; for all men are divinely appointed or none; they spring from the common body of the people. (I have seen Italian peasants who look the image of Fermi, the great physicist.) There are men and women of peculiar talent who can see across distances of social space inaccessible to the senses of ordinary men. Some have minds fitted by nature to comprehend the distant experience of humanity in time, that is, in history; others are geniuses of intellectual coordination, of immense span, who sense connections, correlations, and causality and can predict the shape of coming things—an Aristotle, a Montesquieu, a Hegel, a Marx, a Toynbee, and an H. G. Wells. Others are geniuses of psychological and spiritual insight: the un-uttered

secrets of individual capacity and aspiration yield to them, and the hopes and fears of salvation dwelling in the labyrinth of each person emerges at their scrutiny: Socrates, Aquinas, Machiavelli, Spinoza, Rousseau, Burke, Bentham, Goethe, Shaw, Freud. There are geniuses of feeling and sensitivity, of justice and mercy: they feel more vividly and painfully than others with St. Thomas that "it is no part of Christian perfection to endure with equanimity the wrongs inflicted on other people." Often, therefore, they can express these feelings more vividly, and under their impulse sacrificially dedicate their lives to the establishment of remedies and opportunities for human society by preaching, teaching, or politically and socially building: Tom Paine, Thomas Jefferson, Elizabeth Fry, Lincoln, Robert Owen, Florence Nightingale, Jane Addams, Mrs. Sidney Webb. These stand on the summit, but close to them are many thousands, themselves able thinkers, critics, and intermediaries and popularizers, and some are practical political and social leaders. All such people think and feel earlier and differently from their fellow citizens in general, so much so that they may be repugnant to them. Yet these are the men and women who will—with the pains described by Hegel in his exhortations about "great" men—in the long run advance the freedom and happiness of all if they are tolerated for long enough to impress their message. For the sake of the general freedom their special freedom is above all necessary, and its defense is an obligation of the masses, returning incalculable benefits. The nation is blessed which cherishes its heretics.

The task of the plain man in a democracy is, then, not easy. The continuance and operation of this system of government requires that he tolerate and listen to innovation and adequately reflect so that he may distinguish between the sincere and the insincere, the well-wishers and the misguided, the genuine and the charlatans, the visions from the hallucinations, and so that he may decide how much of the contribution of each is not only for his own good now but for his own good in the long run, and not only

for his own good in the long run, but for that of his neighbors all over the world.

In the dictatorial state, the pattern of man's perfect character is one man's vision; the teaching of "character" means the imposition of that mold, while good citizenship consists of submission to its confinement. In the democratic state, since perfection is yet to be discovered and is contingent on a continuing quest, the nature of the preferred character is the one that accepts plasticity and the principle of live and let live, of adventure and of self-expression leading to that end. While the dictatorial state thrusts the main emphasis upon obedience, the democratic places the accent upon the conditional terms of consent and the expression of disagreement. The dictatorial state removes responsibility from the conscience of the individual party member and tries to chloroform or hypnotize the mind; in the democratic, the conscience of the individual is fully responsible, refreshed by the beating waves of dynamic opinion, and troubled. Therefore, where dictators rule, the peculiar duty of a party member seems to be harder than that of the democratic citizen; but, in truth, the implied responsibilities of democracy are much more exacting. For self-government means, first, the government of one's self. That is why the democratic states vibrate, sometimes violently, and seem and are unstable. It explains why, therefore, the democratic states are not yet as fully democratic as the tasks implied in their own principle require; for the burden is heavy on citizens and party members who take their responsibilities seriously, and so too few of them do. A few well-organized, conscious, competitive, and honorable parties can make the tasks easier to fulfill. The dictatorships show that there is a clear alternative to the burdens of democratic citizenship; but is it nice?

We do not know to what the whole process is tending in its large and far-flung outlines. We cannot know. We do not even know the possibilities more than a little space of time away. It is a difficult and most sedative process to get to know. (Hence, Georges Sorel: "Away with blue-

## CONCLUDING OBSERVATIONS

books: they reduce your revolutionary ardor!") We cannot be audacious about human potentialities, even though history is long. It is only a step from the sanguine to the sanguinary, and Hitler, Stalin, and Mussolini took it. Democrats have to grasp the nettle of their own hopes in the beneficence of freedom for the whole multitude, whatever the consequences of the freedom—that none, not the greatest, can prove the tenability of any one faith on which mankind can be united.<sup>16</sup> That nettle is (and it is wholesome, if prickly) that the true and the good are revealable, not at once, but as you go along, and as you keep the ways open for it from wherever it may come, by your modesty, your hesitations, your reflection, your listening, and encouragement of those who have something to say or, where less articulate, can signify by action. This is the philosophical moderator of the self-realization that is a basic tenet of democratic theory.

The criterion is the grant of all freedom to act and develop except to destroy or indubitably endanger that freedom. In the light of this, there are bounds to all forms of expression and action, for individuals, groups, classes, parties, and occupations; and a doctrine would elaborate and illuminate this. The nazis and the fascists produced such a doctrine in the form of history, philosophy, and civil studies, for their purposes. Its intent, not its content, is relevant. It was to serve to clarify the relationship between the kaleidoscope of hundreds of diverse events in the common man's environment and experience, the many everyday seemingly eccentric and arbitrary happenings and their civic relevance to him. It was to replace the chaos of the city streets by a world's meaning. It was on the way to achievement by the establishment of a doctrine of human destiny and duty, drawn from history interpreted by reason, to serve as the thread and signal of direction. It sought to bring nature, history, and

spirit into a conspiracy to subvert liberty. All things that the common man saw and heard and surmised, but could not correlate or draw meaning from, the nazis and the fascists suffused with coherence by relating to the focus of meaning which they had created. The Russian Communist party, concerned to secure continuous and dynamic loyalty, was forced to find an answer to the problem whether its members could be reliable unless they had absorbed the Marxian historical analysis and logic.

There is no doubt at all that the like can be achieved and made acceptable for and by democratic man, by relating the events of his society and the march of history to the essential democratic doctrine here proposed. Its requisite is Time, but Time may be economized by collective and persistent effort.

One hundred and fifty years ago, in the midst of the French Revolution, the Abbé Siéyès asked, what is the Third Estate?—and answered that it was nothing. And further, what did it want to be?—and replied, Something. And, finally, what ought it to be?—and declared, Everything! Today, the Third Estate is Everything, for the People hold the plenitude of power. A new era evokes new questions. What does the People demand? Equality. What does it chiefly want? Plenty. What does it need, and what ought it to give? Mercy. And of all the polities known to us, democratic government, with all its natural imperfections, is Mercy's most assured and durable instrument, and the best tempered.

Political science is confession: and to teach it is to confess. This does not mean that it is merely introspection, for the mind is not nourished only by what it contemplates within. Looking outward in time and in space, as well as deep down inwardly, the mind apprehends a world. And, in order that our good may not be wrested from us, it is imperative that along with its smiling certitudes, we confide the doubts and uncertainties, the weaknesses and ignorance of our world, to those who day by day can and must revive freedom and advance mercy.

<sup>16</sup> Even when presented as Humanity, as in Auguste Comte, *System of Positive Polity* (London, 1875), on which see J. S. Mill's dissent in his *Autobiography*.

## APPENDIX A

### INTERPRETATION OF EFFICIENCY RATING

Your efficiency rating is an official record of the way you are doing the work of your job.

*Excellent (E)* means that performance in every important phase of the work was outstanding and there was no weakness in performance in any respect.

*Very Good (VG)* means that performance in at least half of the important phases of the work was outstanding and there was no weakness in performance in any respect.

*Good (G)* means that performance met requirements from an over-all point of view.

*Fair (F)* means that performance did not quite measure up to requirements from an over-all point of view.

*Unsatisfactory (U)* means that performance in a majority of important phases of the work did not meet job requirements.

### INSPECTION

You are entitled to inspect the final ratings (not the rating forms) of all employees in your office or station.

### SIGNIFICANCE OF EFFICIENCY RATINGS

An efficiency rating of "Good," "Very Good," or "Excellent" is necessary in order to receive a periodic within-grade salary advancement.

An efficiency rating of "Fair" requires a one-step salary reduction if an employee's pay rate is above the middle rate for his grade (the fourth step in six-rate grades).

An efficiency rating of "Unsatisfactory" requires that the employee be dismissed or reassigned to other work in which he could be reasonably expected to render satisfactory service.

Efficiency ratings are a factor in determining the order in which employees are affected by reduction in force.

### APPEALS

If you believe your rating is wrong, you should first discuss it with your supervisor or personnel officer. You have the right, if your position is subject to the Classification Act, to appeal your rating within certain time limits to a board of review established for your agency. Appeals or requests for additional information concerning appeals should be addressed to the Chairman, Board of Review, care of Civil Service Commission, Washington 25, D. C.

## Addenda

Page 106, column 2, line 28

The framers of the Constitution of 1958, and de Gaulle in particular, always thought that governmental stability could only be ensured if the powers were truly separated. Despite the fact that the broad framework of the Constitution was to be parliamentary, the powers of Parliament, and in particular those of the *lower* Chamber (the National Assembly) were curtailed. Two drastic provisions were particularly aimed at this purpose. *Firstly*, deputies and senators were made to relinquish their seat in Parliament if they were appointed ministers (art. 23) (see p. 646). *Secondly*, art. 34 defined the field of legislation in a restrictive way. It includes the rules concerning civil rights, family law, criminal law and procedure, taxation, elections, nationalizations and national service. It also includes the principles, but *only the principles*, of the organization of defence, local government, education, property law, labour and trade union law and social security law. In this second category, detailed application of the law is to be made by governmental decree. But in all the fields outside those mentioned, the Government has complete discretion. Parliamentary competence is limited to the matters mentioned in art. 34. To enforce this prescription, the Government can appeal to the Constitutional Council (see p. 155).

Page 124, column 2, line 6

What strength such a constitution could have was shown by its collapse when the régime was subjected to the Algiers insurrection of May 1958. The National Assembly resigned itself to give de Gaulle power to reform the Constitution by a law passed on June 3, 1958, in conditions bearing some similarities with the vote of full powers to Pétain in 1940. Some limitations were introduced: the new régime was to be democratic and *parliamentary*; de Gaulle was not left free to create a presidential system on the American pattern. However, the new constitution did not have to be approved by Parliament, but only by the people. The draft was to be submitted to a Consultative Constitutional committee, drawn partly from members of both Houses of Parliament; but most of the changes which that body proposed were not adopted by the Government. The referendum took place on September 28, 1958, and it gave a four to one majority to the constitution. There were 17.6

million YES against 4.6 million NO, a proportion of the communists, estimated at about one-fifth, having disregarded their party's advice to reject the constitution.

Page 537, column 1, line 8

*The Fifth Republic. Interpellation linked with motion of censure.* It is because the interpellation was such a dangerous weapon that the constitution of 1958 restricts it so severely. It can only be done now through the means of the motion of censure, which is analysed, p. 646.

*Questions.* Apart from interpellations, deputies can still put questions and the constitution of 1958 recognizes this right (art. 48). There can however be no vote after the question: deputies tried to introduce a vote via their standing orders, but the Constitutional Council ruled it unconstitutional, on the grounds that it would have meant reintroducing the interpellation by the backdoor and outside the procedure of the motion of censure.

Page 646, foot of page

*The executive in the Fifth Republic.* The Fourth Republic fell, largely because it had not proved capable of solving the problem of ministerial instability which had already plagued the Third Republic. One of the aims of the framers of the Constitution of 1958 was to strengthen the executive, while still maintaining the principle of parliamentary government. Some of the technical measures have already been described (see above, on executive-legislative relationship), but these measures are part of a more general plan which deserves to be described as a whole.

*The Presidency of the Republic.* The first element of the plan consisted in increasing the authority of the President of the Republic: to do so, it was decided to abandon the principle of his election by Parliament, which had in any case proved difficult in 1953, when M. Coty, the second President of the Fourth Republic, only obtained the required absolute majority at the thirteenth ballot. The second aspect consisted in giving to the President an "arbitrating power" (de Gaulle): this was done by granting him the powers which he had during the Third Republic and which the Constitution of 1946 had curtailed and by granting him a limited number of new powers, in particular in time of emergency.

*Election of the President.* The creation of a suitable electoral college for the Presidency did pose a problem because parties of the centre and centre-left opposed the idea of direct popular election, which might produce another Bonaparte. It was therefore decided that the President would be elected by representatives of local authorities, although the consequence is that, as for the Senate, the electoral college unduly favours the rural areas.

The college comprises (art. 6 of the Constitution) "the members of Parliament, of departmental councils and of Assemblies of the overseas territories as well as the representatives elected by the municipal councils." The last category is by far the most numerous. It includes, in the first place, all mayors, of whom there are around 38,000, and who constitute almost half of the electoral college of about 80,000; it also includes municipal councillors, the number of municipal councillors eligible depending on the size of the local authority, the general rule being that there is one representative per 1,000 inhabitants or fraction of 1,000. Since there are about 3 million inhabitants in Paris, the municipal council elected about 3,000 electors who, together with the council, constituted the electoral college for the City. However, the number of local authorities under 1,000 in France is so large—the *average commune* is only just over 1,000 strong—that these local authorities are represented on the electoral college out of proportion with their population. The Constitution prescribes a two-ballot system (art. 7). At the first election, which took place in December 1958, de Gaulle was elected at the first ballot with 62,394 votes (57,649 in metropolitan France alone) out of a total electorate of 81,761, of whom 81,284 voted: he thus obtained 78 per cent of the votes cast, the rest being divided between a Communist candidate and a left-wing Socialist.

*Powers.* The President, still elected for seven years, and indefinitely re-eligible, recovers the powers which he had during the Third Republic, while keeping those which he had during the Fourth. He is the Head of the State and of the Armed Forces. He receives Ambassadors and accredits them. He chooses the Premier, and, as is traditional in France, presides over the Council of Ministers. He recovers the power to sign all decrees, which

had been given to the Premier in the Fourth Republic. He still has the power (practically never used) to ask for a second reading of bills. He presides over the Constitutional Council, of which he appoints one-third, and the High Council of the Judiciary, of which he also appoints a proportion. He is given back the unrestricted power of pardon.

There are four new powers which the Constitution gives him and which no previous President enjoyed. *Firstly*, he is given an almost unlimited right of dissolution, the only restriction being that he cannot dissolve the National Assembly twice in the same year (art. 12). *Secondly*, he can send bills to the Constitutional Council. *Thirdly*, he can commit bills to a referendum, if these bills deal with the organization of the State or are made to ratify treaties which may have some impact on the functioning of internal institutions (this was introduced because de Gaulle would have liked to see a referendum on the question of the European Defence Community) (art. 11). *Fourthly*, according to article 16:

When the institutions of the Republic, the independence of the Nation, the integrity of its territory or the execution of its international commitments are gravely and immediately threatened and the functioning of the constitutional public authorities is interrupted, the President of the Republic takes the measures required by these circumstances after official consultation with the Prime Minister and the Presidents of the Houses of Parliament as well as with the Constitutional Council.

He informs the nation of these measures by a message.

This article is one of the most controversial of the Constitution. It appeared so drastic and so vague that the Consultative Constitutional Committee pressed for the inclusion of some guarantee of the rights of Parliament. The result was the inclusion of the following paragraphs in the article:

These measures must be inspired by the will to assure to the constitutional public authorities, within the shortest possible time, the means of fulfilling their tasks. The Constitutional Council is consulted on these measures. Parliament meets of right.

The National Assembly cannot be dissolved during the exercise of the exceptional powers.

There is no doubt that de Gaulle had in mind situations similar to those of 1940. However, such powers are unquestionably

an opening for any President who would want to perpetuate his power, or to prevent measures which he opposes from being taken. Moreover, such an article would have been useless in the situation of 1940: the then President could have left France with his government; since he did not do so, such an article would not have helped General de Gaulle to legalize his Free French Movement in England.

*The Prime Minister and the Government.* The powers given to the President are wide, but they are meant to leave him in the position of an arbiter, who might only have to take effective power in case of an emergency. At the same time the Constitution stresses the fact that it is the Government which "conducts the policy of the Nation" (art. 20).

Indeed, like that of the Fourth Republic, the Constitution of the Fifth Republic intends to reinforce the position of the Premier, who is for the first time named "Prime Minister." He directs the administration and the military (art. 20). He is responsible for national defence. The President cannot sign decrees without his countersignature, or that of a minister, except those decrees expressly listed in article 19 and dealing with powers such as dissolution, appointment of Premier (but not of ministers) or use of article 16. The President is therefore not free to choose the ministers, who are presented to him by the Premier; he cannot dismiss the cabinet while he is obliged to accept the resignation of the cabinet when it has been defeated on a vote of censure (art. 50). The Constitution thus embodies the main principles of parliamentary government and creates a dual executive.

As we have already said, the Government has, on the other hand, a number of important powers over the Assembly. The control of the time-table and the control of business on the floor of the House enable the French Government to be, for the first time, the leading element in the development of the work of Parliament. However, the Constitution has gone further than just redressing a situation which, before 1958, was unquestionably tilted in favour of the National Assembly. It has deliberately tilted the balance in favour of the Government, in particular owing to four types of restrictions.

*Firstly*, the definition of law is restrictive, and leaves a very wide scope to the independent action of the Government (see above, p. 106). *Secondly*, Parliament

is no longer master of its sessions and the length of the sessions is unnecessarily restrictive: the maximum time during which Parliament can meet in two ordinary sessions is 5½ months (art. 28); there can be emergency sessions, but these cannot last more than 12 days (art. 29). *Thirdly*, article 23 decides that members of Parliament have to relinquish their seats if they become members of the Government.<sup>1</sup> This proviso is deemed to have a salutary psychological effect, many political crises having taken place because deputies were apparently anxious to replace their colleagues in ministerial posts. This is, however, a definite break with the tradition of parliamentary government and may have far-reaching consequences on the nature of the ministerial personnel. Although many ministers of the first cabinet were politicians, others were civil servants, partly because some politicians are not willing to abandon their safe parliamentary seats for a ministerial post which may not last very long, partly because de Gaulle unquestionably had a preference for civil servants, who were unlikely to want to shape general policy. If this trend were to last, the French cabinet may become, like the American cabinet, a collection of high executive officers, instead of a collective policy-making body, with that difference that, in France, the range from which non-political ministers will be chosen will be much narrower and almost exclusively confined to the civil service.

*Fourthly*, the Constitution creates, in its article 49, a very peculiar procedure for votes of censure, which replaces, as already stated, the traditional *ordre du jour* after an interpellation and also replaces the vote of confidence of the Fourth Republic. The question of confidence was, in the spirit of the Constitution of 1946, a device which should have strengthened the Government, since it had to be defeated by an absolute majority to oblige the Government to resign. However, the procedure was not successful and governments resigned outside the scope of the vote of confidence, partly because they often crumbled from inside and partly because the constituents of 1946 had

<sup>1</sup> In order to avoid by-elections each time a minister was appointed, the electoral law of 1958 obliged each deputy to choose a "substitute" who replaces him in case of death or of appointment to the Government.

apparently not been aware of the fact that the life of the Government could be at stake, not only in the course of an interpellation, but also in the course of the discussion of legislation: if the Government was in difficulty over the discussion of a bill, the question of confidence was a useless weapon: even though it might brandish it, the Government could still find itself without the bill which it wanted, because the absolute majority requirement only applied to the question of confidence itself, and not to the bill, which could only be passed if a *relative* majority had been cast *in its favour*. By skilfully using abstentions, deputies could leave a government in office, without means of action: the government resigned, although it still technically had the confidence of the Assembly, and therefore generally could not use the weapon of dissolution.

The framers of the 1958 Constitution invented a more stringent device: they decided that the only means by which a Government could be overthrown was to be the motion of censure. This must be signed by one-tenth of the membership of the Assembly and the same deputies can only do so twice a year. The vote is only taken after 48 hours. Only the votes cast *in favour* of the motion count, i.e., against the Government; the others in fact abstain. The motion is only carried if it receives an absolute majority.

The difficulty was to find a means by which this procedure could be used for legislation as well. The framers of the Constitution found it in deciding that the Prime Minister could state formally in the House that it considered that the passing of a bill was a question of confidence. If he does so, the bill is deemed to be carried *without a vote*, unless a motion of censure is tabled within 24 hours in the prescribed form. The absolute majority formula is thus used for legislation as much as for interpellations.

This procedure is one of the technical means by which the Constitution of 1958 tries to create ministerial instability artificially, while party stability is lacking in the French Parliament. It is difficult to imagine that it will be successful in the long run. The early years of the Fifth Republic are a poor guide to future developments, because the prestige of the

first President of the Republic, and the particular circumstances of the birth of the régime, have altered the political situation. Governmental stability has been much more due to the fact that de Gaulle can still threaten deputies with the danger of total abolition of the parliamentary régime than to the use of the techniques made possible by article 49.

Indeed, more generally, the first years of the Fifth Republic are full of developments which are sometimes plainly unconstitutional. The main development has been the rôle which de Gaulle has assumed for himself and which has been expressed by the President of the National Assembly, M. Chaban-Delmas, in a speech at the U.N.R. Congress of 1959. He claimed that the President was in charge of a number of "reserved" matters, such as foreign affairs, defence, Algeria, and that, in these matters, the Government's function was to apply the President's policy. This interpretation cannot, however, fit with the letter and the spirit of the constitution. Article 20 states that "*the Government determines and conducts the policy of the Nation*" and article 21 decides that "*the Prime Minister leads the action of the Government*" (*my italics*). The fact that the President attends the meetings of the Council of Ministers is irrelevant: French Presidents have always done so; they certainly have a "right to be consulted and a right to warn"; they have no right to decide. The Constitution of 1958 has not changed the situation.

However, it is difficult to imagine that this interpretation of the Constitution will remain indefinitely, and, in particular, that it could survive General de Gaulle. France has never had a successful presidential régime; the divisions of the parties, already very apparent in the early years of the Fifth Republic—despite the immense shadow of the President of the Republic—will unquestionably reappear in full light, as soon as the crisis which made de Gaulle's return to power possible will have been solved. Then will be the time to judge the strength and value of the new technical devices introduced in articles 40 to 50. It is in this sense that the study of the Third and Fourth Republics remains entirely relevant to the study of the French Fifth Republic.
